Complements

In
$$TOP(X)$$
, $\tau = \lesssim$ and $\tau' = \lesssim'$ are complements iff
 $\tau \lor \tau' = \mathcal{P}(X) = \top$ and $\tau \land \tau' = \{0, X\} = \bot$

iff

$$\uparrow x \cap \uparrow' x = N(x) \cap N'(x) = \{x\} \quad \forall x \in X,$$

$$\uparrow \uparrow' \uparrow \uparrow' \cdots \uparrow \uparrow' \uparrow \uparrow' x = X \quad \forall x \in X$$

Totally ordered complements only for POsets

If quasiorder $\lesssim\,$ is not a p.o., then $\,\lesssim\,$ has no totally ordered complement \leq'

Case 1: $b \in \uparrow a \cap \uparrow' a$, so $\uparrow a \cap \uparrow' a \neq \{a\}$.

Case 2: $a \in \uparrow b \cap \uparrow' b$, so $\uparrow b \cap \uparrow' b \neq \{b\}$.

Every non-discrete topology \lesssim on a finite set X has a complement \leq which is a partial order (i.e., T_0) with height $h \leq 3$.

Complements of Submaximal Spaces

Theorem

Suppose (X, \leq) is submaximal and not discrete. If \leq' is a complement of \leq , then

- (a) every minimal \leq '-cloud contains some $t \in T$ and no points b < t, and
- (b) every maximal \leq' -cloud contains an element of B.

Corollary

A submaximal space \leq' with isolated points has no submaximal complement \leq .

Complements of Submaximal Spaces

Theorem

Suppose (X, \leq) is submaximal and not discrete. If \leq' is a complement of \leq , then

- (a) every minimal \leq' -cloud contains some $t \in T$ and no points b < t, and
- (b) every maximal \leq' -cloud contains an element of B.

Corollary

A submaximal space \leq' with isolated points has no submaximal complement \leq .

Proof: A \leq' isolated point *t* would be a \leq' -maximal and a \leq' -minimal cloud, so $t \in T \cap B = \emptyset$.

Sumbax comps of Submax spaces

Theorem

A submaximal space (X, \leq) has a submaximal complement iff it has no isolated points.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ ▲ 三 ● ● ●

Sumbax comps of Submax spaces

Theorem

A submaximal space (X, \leq) has a submaximal complement iff it has no isolated points.

Note: Edwin Hewitt calls submaximal with no isolated points. "MI spaces".

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Sumbax comps of Submax spaces

Theorem

A submaximal space (X, \leq) has a submaximal complement iff it has no isolated points.

Flip \leq , pick one minimal point from each component, cyclically permute.

(日) (四) (日) (日) (日)

Door spaces have totally ordered complements

イロト 不得 トイヨト イヨト

э

Door spaces have totally ordered complements

Indeed, if |X| = n and |B| = b, there are b(n-2)! totally ordered complements.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Whyburn Complements of Whyburn spaces

If no isolated points, no "branches" (i.e., |B| = |T|, $K = \emptyset$)

Take \leq' to be \geq with the boxed elements from \leq cyclically permuted in \leq' . \leq'' is a T_0 complement of \leq .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

Whyburn Complements of Whyburn spaces

With isolated points

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Not every Whyburn space has a Whyburn complement

Theorem

(a) If (X, \leq) is a Whyburn space with $C = \emptyset$ and $|T| \geq |B| > 1$, then \leq has a Whyburn complement if and only if |B| = |T|and $K = \emptyset$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

(b) If (X, \leq) is a Whyburn space with $T = B = \emptyset$ and $4 \leq |C| \leq |K|$, then \leq has no Whyburn complement.

Example: Whyburn spaces

X has a Whyburn complement; Y and Z do not.
