ITM introduced by Bruin & Troubetzkoy in 2003

$$T_{\alpha,\beta}(x) = \begin{cases} x + \alpha, & x \in [0, 1 - \alpha), \\ x + \beta, & x \in [1 - \alpha, 1 - \beta), \\ x - 1 + \beta, & x \in [1 - \beta, 1] \end{cases}$$

on the parameter space $U = \{(\alpha, \beta) : \mathbf{0} < \beta \le \alpha \le \mathbf{1}\}.$

Renormalization transforms $T_{\alpha,\beta}$ into $T_{\alpha',\beta'}$ with:

$$(\alpha',\beta') = \mathbf{G}(\alpha,\beta) = \left(\frac{\beta}{\alpha}, \frac{\beta-1}{\alpha} + \lfloor \frac{1}{\alpha} \rfloor\right).$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Types of parameters

- Finite Type: Gⁿ(α, η) ∉ U[◦] for some n ≥ 1. Then T_{α,β} reduces to an interval exchange transformation.
- Infinite Type: Gⁿ(α, η) ∈ U for all n ≥ 1. Then Ω := ∩_{n≥0} Tⁿ_{α,β}([0, 1]) is a Cantor set with T_{α,β} a minimal endomorphism.

The set of parameters (α, β) with $T_{\alpha,\beta}$ is of infinite type has Lebesgue measure zero but positive Hausdorff dimension.

S-adic Subshift

Symbolically, one renormalization step is given by the substitution

$$\chi_{k}: \begin{cases} 1 \to 2\\ 2 \to 31^{k}\\ 3 \to 31^{k-1} \end{cases} \quad \text{for } k = \left\lfloor \frac{1}{\alpha} \right\rfloor \in \mathbb{N}$$

with unimodular incidence matrix

$$A_k = egin{pmatrix} 0 & k & k-1 \ 1 & 0 & 0 \ 0 & 1 & 1 \end{pmatrix}$$
 and $\det(A_k) = -1.$

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 - のへで

We define a S-adic subshift based on a sequence of substitutions χ_{k_i} , $k_i \in \mathbb{N}$. The itinerary of the point 1 is

$$\rho = \lim_{i \to \infty} \chi_{k_1} \circ \chi_{k_2} \circ \chi_{k_3} \circ \cdots \circ \chi_{k_i}(\mathbf{3}).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Subshift *X* is the closure of $\{\sigma^n(\rho)\}_{n\in\mathbb{N}}$ where σ is the left-shift.

We define a S-adic subshift based on a sequence of substitutions χ_{k_i} , $k_i \in \mathbb{N}$. The itinerary of the point 1 is

$$\rho = \lim_{i \to \infty} \chi_{k_1} \circ \chi_{k_2} \circ \chi_{k_3} \circ \cdots \circ \chi_{k_i}(\mathbf{3}).$$

Subshift *X* is the closure of $\{\sigma^n(\rho)\}_{n\in\mathbb{N}}$ where σ is the left-shift.

Every *ITM of infinite type* in this family is uniquely characterised by a sequence $(k_i)_{i \in \mathbb{N}} \subset \mathbb{N}$ such that

 $k_{2i} > 1$ for infinitely many $i \in \mathbb{N}$ and $k_{2j-1} > 1$ for infinitely many $j \in \mathbb{N}$.

Weak Mixing

Definition

A system (X, T) is called *weakly mixing* if the Koopman operator

 $U_T(f) = f \circ T$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

has 1 as its only eigenvalue.

If an eigenfunction *f* is

- ▶ in L^2 , then its eigenvalue is called *measurable*,
- continuous, then its eigenvalue is called *continuous*.

Eigenvalue Conditions

Conditions for (non)existence of eigenvalues go back to Host and Veech.

- Typical weak mixing for interval exchange transformations: Nogueira & Rudolph, Sinaĭ & Ulcigrai, Avila & Forni.
- Conditions for Bratteli-Vershik systems by Bressaud, Durand, Frank, Maass,... several papers.
- Can more or less be translated into behaviour of the unimodular incidence matrices A_{ki}, interpreted as toral automorphisms: There is an eigenvalue

$$\vec{t}A_{k_1}A_{k_2}\cdots A_{k_n} \mod 1
ightarrow 0,$$
 for some $\vec{t}=(t,t,t)
eq ec{0}.$

(ロ) (同) (三) (三) (三) (○) (○)

Eigenvalue Conditions

Conditions for (non)existence of eigenvalues go back to Host and Veech.

- Conditions for Bratteli-Vershik systems by Bressaud, Durand, Frank, Maass,... several papers.
- Can more or less be translated into behaviour of the unimodular incidence matrices A_{ki}, interpreted as toral automorphisms: There is an eigenvalue

$$\vec{t}A_{k_1}A_{k_2}\cdots A_{k_n} \mod 1 \rightarrow 0,$$
 for some $\vec{t} = (t, t, t) \neq \vec{0}.$

(ロ) (同) (三) (三) (三) (○) (○)

Lemma

The dynamics of $z \mapsto A_{k_1}A_{k_2} \cdots A_{k_n} z \mod 1$ has one stable and two unstable directions.

Subtractive Algorithm

Determining whether $\vec{t}A_{k_1}A_{k_2}\cdots A_{k_n} \mod 1 \rightarrow 0$ reduces to a problem for a "subtractive algorithm" on the simplex $\Delta = \{0 \le u \le u + v \le 1\}$:

 $H_k: (u, v) = \frac{1}{D_k}(v, 1-v)$ for $D_k = k(1-v) + 1 - u$,

We have $\vec{t}A_{k_1}A_{k_2}\cdots A_{k_n} \mod 1 \to 0$ "if and only if" $(u, v) \in \Delta$ lies on a line $\ell_{p,q,r} = \{u(q-r) = v(p-r) + q - p\}.$

(ロ) (同) (三) (三) (三) (○) (○)

Subtractive Algorithm

Facts about the subtractive algorithm $H : \Delta \rightarrow \Delta$:

$$H(x,y)=H_k^{-1}(x,y)\mapsto \left(rac{x+(k+1)y-1}{x+y}\ ,\ rac{x}{x+y}
ight) \quad ext{ if } (u,v)\in\Delta_k.$$

• *H* is *full Markov*: $H(\Delta_k) = \Delta$ for all *k*.

- ▶ the line $L = \{x + y = 1\}$ consists of neutral period 2 points (and $(\frac{1}{2}, \frac{1}{2})$ is fixed).
- ► every rational point in △ is eventually mapped into L (finite type case).
- elsewhere *H* is eventually expanding (in Hilbert metric): every infinite type (k_i)_{i≥1} is realized by exactly one point (x, y) ∈ Δ°.

Subtractive Algorithm

Facts about the subtractive algorithm $H : \Delta \rightarrow \Delta$:

$$H(x,y)=H_k^{-1}(x,y)\mapsto \left(\frac{x+(k+1)y-1}{x+y}\ ,\ \frac{x}{x+y}\right) \quad \text{ if } (u,v)\in \Delta_k.$$

• *H* is *full Markov*: $H(\Delta_k) = \Delta$ for all *k*.

- ▶ the line $L = \{x + y = 1\}$ consists of neutral period 2 points (and $(\frac{1}{2}, \frac{1}{2})$ is fixed).
- ► every rational point in △ is eventually mapped into L (finite type case).
- elsewhere H is eventually expanding (in Hilbert metric): every infinite type (k_i)_{i≥1} is realized by exactly one point (x, y) ∈ Δ°.

Question: Does H preserve an (infinite) invariant measure \ll Leb?

Results (weak mixing)

Theorem

Every (pre)periodic infinite type sequence $(k_i)_{i\geq 1}$ corresponds to a weakly mixing ITM.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

Results (weak mixing)

Theorem

Every (pre)periodic infinite type sequence $(k_i)_{i\geq 1}$ corresponds to a weakly mixing ITM.

Theorem

Every infinite type sequence $(k_i)_{i\geq 1}$ such that the corresponding $(u, v) \notin \bigcup_{p,q,r} \ell_{p,q,r}$ and $\liminf_i k_i < \infty$ corresponds to a weakly mixing ITM.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Results (eigenvalues)

Recall that every infinite type sequence $(k_i)_{i\geq 1}$ corresponds to a unique $(u, v) \in \Delta$.

Theorem

Almost every (w.r.t. 1-dim. Lebesgue) infinite type sequence $(k_i)_{i\geq 1}$ such that $(u, v) \in \ell_{p,q,r}$ corresponds to an ITM with a continuous eigenvalue $e^{2\pi i t}$ of the Koopman operator.

However, for every $p, q, r \in \mathbb{N}$ there exist parameters

 $(u, v) = (u(t), v(t)) \in \ell_{p,q,r}$

・ロト ・ 同 ・ ・ ヨ ・ ・ ヨ ・ うへつ

such that $e^{2\pi it}$ is not a continuous eigenvalue.

Results (eigenvalues)

Recall that every infinite type sequence $(k_i)_{i\geq 1}$ corresponds to a unique $(u, v) \in \Delta$.

Theorem

Almost every (w.r.t. 1-dim. Lebesgue) infinite type sequence $(k_i)_{i\geq 1}$ such that $(u, v) \in \ell_{p,q,r}$ corresponds to an ITM with a continuous eigenvalue $e^{2\pi i t}$ of the Koopman operator.

However, for every $p, q, r \in \mathbb{N}$ there exist parameters

 $(u,v)=(u(t),v(t))\in\ell_{\rho,q,r}$

such that $e^{2\pi it}$ is not a continuous eigenvalue.

Question: Do there exists ITMs in this family where the eigenvalue is measurable but not continuous?

Measurable Eigenvalues

Conditions for measurable eigenvalues are more difficult to compute:

Theorem (Durand, Frank, Maass in 2019)

There is a sequence of functions $\rho_n: V_{n+1} \to \mathbb{R}$ such that

$$g_n(x) := t\left(\tilde{S}_n(x) + \rho_n(w)\right) \mod 1$$

converges for μ -a.e. $x \in X_{BV}$ as $n \to \infty$,

where $\tilde{S}_n(x) = \sum_{j=1}^n \langle \tilde{s}_j(x), h_j(v) \rangle$ is the minimal number of steps to the base of a tower.

Theorem

If $\liminf_n k_n < \infty$ and $\vec{t} \notin W^s$, then the corresponding ITM is weakly mixing.

It is an open question if there are ITMs with measurable and non-continuous eigenvalues.

Results for Continuous Eigenvalues

Theorem (Host in 1986)

For a primitive substitution system a sufficient condition to have an eigenvalue $e^{2\pi i t}$ for some $t \in (0, 1)$ is

$$\sum_{n=1}^{\infty} \|\vec{t} A^n\| < \infty, \qquad \vec{t} = (t, t, t),$$

where |||x||| is the distance of a vector to the nearest integer lattice point.

This condition was later expanded to hold for linearly recurrent S-adic shifts and their continuous eigenvalues:

$$\sum_{n=1}^{\infty} \| \vec{t} \tilde{A}_1 \cdots \tilde{A}_n \| < \infty, \qquad \vec{t} = (t, t, t),$$
