ZERO ENERGY SCATTERING FOR ONE-DIMENSIONAL
SCHRÖDINGER OPERATORS AND APPLICATIONS TO
DISPERSE ESTIMATES

IRYNA EGOROVA, MARKUS HOLZLEITNER, AND GERALD TESCHL

Abstract. We show that for a one-dimensional Schrödinger operator with
a potential whose \((j + 1)\)’th moment is integrable the \(j\)’th derivative of the
scattering matrix is in the Wiener algebra of functions with integrable Fourier
transforms. We use this result to improve the known dispersive estimates
with integrable time decay for the one-dimensional Schrödinger equation in
the resonant case.

1. Introduction

This paper is concerned with the one-dimensional Schrödinger equation
\[ i\dot{\psi}(x,t) = H\psi(x,t), \quad H = -\frac{d^2}{dx^2} + V(x), \quad (x,t) \in \mathbb{R}^2, \tag{1.1} \]
with a real-valued potential \(V\) contained in one of the spaces \(L^1_\sigma = L^1_\sigma(\mathbb{R})\), \(\sigma \in \mathbb{R}\),
associated with the norms
\[ \|\psi\|_{L^p_\sigma} = \begin{cases} \left( \int_{\mathbb{R}} (1 + |x|)^{p\sigma} |\psi(x)|^p dx \right)^{1/p}, & 1 \leq p < \infty, \\ \sup_{x \in \mathbb{R}} (1 + |x|)^\sigma |\psi(x)|, & p = \infty. \end{cases} \]
We recall (e.g., [15] or [16, Sect. 9.7]) that for \(V \in L^1_1\) the operator \(H\) has a
purely absolutely continuous spectrum on \([0, \infty)\) and a finite number of eigenvalues
in \((-\infty, 0)\). Associated with the absolutely continuous spectrum is the scattering
matrix
\[ \mathcal{S}(k) = \begin{pmatrix} T(k) & R_-(k) \\ R_+(k) & T(k) \end{pmatrix}, \]
which maps incoming to outgoing states at a given energy \(\omega = k^2 \geq 0\). Here \(T\) is
the transmission coefficient and \(R_{\pm}\) are the reflection coefficients with respect to
geright and left incident. At the edge of the continuous spectrum \(k = 0\) the scattering
matrix generically looks like
\[ \mathcal{S}(0) = \begin{pmatrix} 0 & -1 \\ -1 & 0 \end{pmatrix}. \]
More precisely, this happens when the zero energy is non-resonant, that is, if the
equation \(Hf_0 = 0\) has no bounded (distributional) solution. In the resonant situation
the behavior of the scattering matrix is more delicate. For \(V \in L^1_1\) it is already
nontrivial to establish continuity of the scattering matrix at \(k = 0\) (for \(V \in L^1_2\)
de l’Hospital suffices). This question arose around 1985 in an attempt to clarify

whether the low-energy asymptotics of the scattering matrix, obtained for \( V \in L^1_2 \) in [6], are valid for \( V \in L^1_1 \). The problem was solved independently by Guseinov [12] and Klaus [14] (for a refined version see [1] and [9], Theorem 2.1). It also plays an important role in semiclassical analysis, see [5] and the references therein. Furthermore, if \( V \in L^1_{j+1} \) with \( j > 0 \), then, away from 0, one can take derivatives of the scattering matrix up to order \( j \), and in the non-resonant case it is again easy to see that they are continuous at \( k = 0 \). This clearly raises the question about continuity at \( k = 0 \) of the \( j \)th derivative in the resonant case. We will establish this as one of our main results in Theorem 2.9. This result is new even for the first derivative. We remark, that if \( V \) decays exponentially, then \( S(k) \) is analytic in a neighborhood of \( k = 0 \) and the full Taylor expansion can be obtained [2, 3].

It is important to emphasize that this question is not only of interest in scattering theory but also plays a role in the solution of the Korteweg–de Vries equation via the inverse scattering transform (see e.g., [11] where continuity of higher derivatives is needed) and in deriving dispersive estimates for (1.1). The latter case has attracted considerable interest (e.g. [9, 10] and the references therein) due to its importance for proving asymptotic stability of solitons for the associated nonlinear evolution equations (see e.g. [4, 14]).

As an application of our results we will establish the following dispersive decay estimate with integrable time decay in the resonant case:

**Theorem 1.1.** Suppose \( V \in L^1_1(\mathbb{R}) \) and suppose there is a bounded solution \( f_0 \) of \( Hf_0 = 0 \) satisfying the normalization \( \lim_{x \to \infty} (|f_0(x)|^2 + |f_0(-x)|^2) = 2 \). Denote by \( P_0 \) the formal projection onto the span of \( f_0 \) given by the kernel \( [P_0](x,y) = f_0(x)f_0(y) \). By \( P_{ac} \) we denote the projector onto the absolutely continuous subspace of \( H \). Then the following decay holds:

\[
\|e^{-itH} P_{ac} - (4\pi it)^{-\frac{1}{2}} P_0\|_{L_1^1 \to L_\infty^2} = O(t^{-3/2}), \quad t \to \infty.
\]

(1.2)

This theorem is an improvement of an earlier result by Goldberg [10] who established it for \( V \in L^1_2(\mathbb{R}) \). If there is no resonance (i.e. no bounded solution) this result (with \( P_0 = 0 \)) was shown for \( V \in L^1_2(\mathbb{R}) \) in [9] Theorem 1.2. For extensions to discrete one-dimensional Schrödinger equations (Jacobi operators) see [7, 8].

2. **Low energy scattering**

In this section we establish some properties of the scattering data for our operator \( H \) with \( V \in L^1_{j+1}, j \geq 0 \). To this end we introduce the Banach algebra \( \mathcal{A} \) of Fourier transforms of integrable functions

\[
\mathcal{A} = \left\{ f(k) : f(k) = \int_{\mathbb{R}} e^{ikp} \hat{f}(p) \, dp, \hat{f}(\cdot) \in L^1(\mathbb{R}) \right\}
\]

with the norm \( \|f\|_{\mathcal{A}} = \|\hat{f}\|_{L^1} \), plus the corresponding unital Banach algebra \( \mathcal{A}_1 \)

\[
\mathcal{A}_1 = \left\{ f(k) : f(k) = c + \int_{\mathbb{R}} e^{ikp} \hat{g}(p) \, dp, \hat{g}(\cdot) \in L^1(\mathbb{R}), c \in \mathbb{C} \right\}
\]

with the norm \( \|f\|_{\mathcal{A}_1} = |c| + \|\hat{g}\|_{L^1} \). We also use the fact, which is known as Wiener’s lemma [17], that if \( f \in \mathcal{A}_1 \setminus \mathcal{A} \) and \( f(k) \neq 0 \) for all \( k \in \mathbb{R} \) then \( f^{-1}(k) \in \mathcal{A}_1 \).

First we recall a few facts from scattering theory [6, 15]. If \( V \in L^1_1 \) there exist Jost solutions \( f_{\pm}(x,k) \) of \( Hf = k^2f, k \in \mathbb{C}_+ \), which asymptotically behave like
$f_\pm(x, k) \sim e^{\pm ikx}$ as $x \to \pm \infty$. These solutions are given by

$$f_\pm(x, k) = e^{\pm ikx} h_\pm(x, k), \quad h_\pm(x, k) = 1 \pm \int_0^{\pm \infty} B_\pm(x, y) e^{\pm 2iky} dy,$$

(2.3)

where $B_\pm(x, y)$ are real-valued and satisfy (see [6 §2] or [15 §3.1])

$$|B_\pm(x, y)| \leq e^{\gamma_{\pm}(x)} \eta_\pm(x + y),$$

(2.4)

with

$$\gamma_{\pm}(x) = \int_x^{\pm \infty} (y - x) |V(y)| dy, \quad \eta_\pm(x) = \pm \int_x^{\pm \infty} |V(y)| dy.$$

(2.6)

Since $\eta_\pm \in L^1(\mathbb{R}_\pm)$ we conclude, that

$$h_\pm(x, \cdot) \in \mathcal{A}, \quad \forall x \in \mathbb{R}. \quad (2.7)$$

Here and throughout the rest of this paper a prime will always denote a derivative with respect to the spatial variable $x$. As an immediate consequence of the estimates (2.4) and (2.5) we have the following amplification of (2.7):

**Lemma 2.1.** Let $V \in L^1_{j+1}$. Then $\frac{\partial^l}{\partial x^l} (h_\pm(x, k) - 1)$, $\frac{\partial^l}{\partial x^l} h'_\pm(x, k)$ are contained in $\mathcal{A}$ for $0 \leq l \leq j$. Moreover, for $\pm x \geq 0$, the $\mathcal{A}$-norms of these expressions do not depend on $x$.

The fact that $f_\pm(x, -k)$ also solve $Hf = k^2f$ for $k \in \mathbb{R}$ leads to the scattering relations

$$T(k)f_\pm(x, k) = R_\mp(k)f_\mp(x, k) + f_\mp(x, -k),$$

(2.8)

where the transmission coefficient $T$ and the reflection coefficients $R_\pm$ can be expressed in terms of Wronskians. To this end we denote by

$$W(f(x), g(x)) = f(x)g'(x) - f'(x)g(x)$$

the usual Wronskian and set

$$W(k) = W(f_- (x, k), f_+(x, k)), \quad W_\pm(k) = W(f_\mp(x, k), f_\pm(x, -k)).$$

Then

$$T(k) = \frac{2ik}{W(k)}, \quad R_\pm(k) = \mp \frac{W_\pm(k)}{W(k)}, \quad (2.9)$$

The transmission and reflection coefficients are elements of the Wiener algebra, which was established in [19 Theorem 2.1]. Here we extend this result to the derivatives of the scattering data.

**Theorem 2.2.** If $V \in L^1_{j+1}$, then $\frac{\partial^l}{\partial x^l} (T(k) - 1) \in \mathcal{A}$ and $\frac{\partial^l}{\partial x^l} R_\pm(k) \in \mathcal{A}$ for $0 \leq l \leq j$.

**Proof.** We only focus on the resonant case, since the other case is straightforward.

First of all, we abbreviate $h_\pm(k) = h_\pm(0, k), h'_\pm(k) = h'_\pm(0, k)$. Then (2.3) leads us to

$$W(k) = 2ikh_\pm(k)h_- (k) + h_- (k)h'_+ (k) - h'_-(k)h_+(k), \quad (2.10)$$

$$W_\pm(k) = h_\mp(k)h'_\pm (k) - h_\pm(-k)h'_\mp (k). \quad (2.11)$$

Following [19] we introduce

$$\Phi_\pm (k) = h_\pm (k)h'_\pm (0) - h'_\pm (k)h_\pm (0), \quad (2.12)$$
\[ K_\pm(x,y) = \pm \int_y^{\pm\infty} B_\pm(x,z)dz, \quad D_\pm(x,y) = \pm \int_y^{\pm\infty} \frac{\partial}{\partial x} B_\pm(x,z)dz, \tag{2.13} \]

where \( B_\pm(x,y) \) are given by \[2.3\]. Again \( K_\pm(0,y) \) is denoted by \( K_\pm(y) \) and similar for \( D_\pm(y) \). In \[9, Theorem 2.1\], the following equation for \( \Phi_\pm(k) \) was obtained:

\[ \Phi_\pm(k) = 2ik\Psi_\pm(k), \quad \Psi_\pm(k) = \int_0^{\pm\infty} H_\pm(y)e^{\pm 2iky}dy, \tag{2.14} \]

where

\[ H_\pm(x) = D_\pm(x)h_\pm(0) - K_\pm(x)h_\pm'(0), \quad \pm x \geq 0. \tag{2.15} \]

Moreover, \( H_\pm \) satisfies an estimate similar to \[2.4\] as we will show in Lemma \[2.3\] below. As a consequence, \( \Psi_\pm \) and its derivatives up to order \( j \) will be in the Wiener algebra.

Next a straightforward computation (cf. \[9\]) shows

\[ \frac{W(k)}{2ik} = h_\pm(k)h_\pm(k) + \begin{cases} \frac{h_\pm(k)}{h_\pm(0)}\Psi_-(k) - \frac{h_\pm(k)}{h_\pm(0)}\Psi_+(k), & h_\pm(0)h_\pm(0) \neq 0, \\ \frac{h_\pm(k)}{h_\pm(0)}\Psi_-(k) - \frac{h_\pm(k)}{h_\pm(0)}\Psi_+(k), & h_\pm(0) = h_\pm(0) = 0, \end{cases} \]

and since \( \frac{W(k)}{2ik} = T(k)^{-1} \neq 0 \) for all \( k \in \mathbb{R} \), and \( T(k) \to 1 \) as \( k \to \infty \), we conclude that \( \frac{d^l}{dk^l}(T(k) - 1) \in \mathcal{A} \) for \( 0 \leq l \leq j \). Analogously,

\[ \frac{W_\pm(k)}{2ik} = \begin{cases} \frac{h_\pm(-k)}{h_\pm(0)}\Psi_+(k) - \frac{h_\pm(-k)}{h_\pm(0)}\Psi_-(k), & h_\pm(0)h_\pm(0) \neq 0, \\ \frac{h_\pm(-k)}{h_\pm(0)}\Psi_+(k) - \frac{h_\pm(-k)}{h_\pm(0)}\Psi_-(k), & h_\pm(0) = h_\pm(0) = 0, \end{cases} \]

and hence \( R_\pm(k) = \mp \frac{W_\pm(k)}{2ik}T(k) \) has the claimed properties. \( \square \)

To complete the proof of Theorem \[2.2\] we need the following result which is an extension of \[9, Lemma 2.2\]:

**Lemma 2.3.** Let \( H_\pm(x) \) be given by \[2.15\]. For \( V \in L^1 \) the following estimate is valid

\[ |H_\pm(x)| \leq \hat{C}\eta_\pm(x), \quad \pm x \geq 0, \tag{2.16} \]

with some constant \( \hat{C} > 0 \) and \( \eta_\pm(x) \) given by \[2.6\]. Moreover, for \( \Psi_\pm(k) \) defined by \[2.14\] and for \( V \in L^1_{j+1} \) we have

\[ \frac{d^l}{dk^l}\Psi_\pm(k) \in \mathcal{A}, \quad 0 \leq l \leq j. \]

**Proof.** It suffices to prove the estimate for \( H_\pm \). The Marchenko equation (§3.5 in \[15\]) states that the kernels \( B_\pm(x,y) \) solve the equations

\[ F_\pm(x+y) + B_\pm(x,y) \pm \int_0^{\pm\infty} B_\pm(x,t)F_\pm(x+y+z)dz = 0, \tag{2.17} \]

where the functions \( F_\pm(x) \) are absolutely continuous with \( xF'_\pm(x) \in L^1(\mathbb{R}_\pm) \) and

\[ |F_\pm(x)| \leq C\eta_\pm(x), \quad \pm x \geq 0, \tag{2.18} \]
with $\eta_\pm$ from (2.6). Now the calculations in [9] Lemma 2.2 lead to the following integral equation for $H_\pm(x)$:

$$H_\pm(x) \mp \int_0^{\pm\infty} H_\pm(y) F_\pm(x + y) dy = G_\pm(x),$$  \hspace{1cm} (2.19)

$$G_\pm(x) = h_\pm(0) \left( \int_0^{\pm\infty} B_\pm(0, y) F_\pm(x + y) dy \pm F_\pm(x) \right).$$

The estimates (2.4) and (2.18) imply

$$|G_\pm(x)| \leq \tilde{C} \eta_\pm(x), \quad \pm x \geq 0. \hspace{1cm} (2.20)$$

To obtain (2.16) we apply the method of successive approximations (cf. [15, Section 3.2]) to (2.19). To this end let $N > 0$ such that $D(N) := \max \pm C \int_0^{\pm N} \eta_\pm(y) dy \in (0, 1)$, where $C$ is given by (2.18). Then we can rewrite (2.19) in the form

$$H_\pm(x) \mp \int_0^{\pm N} H_\pm(y) F_\pm(x + y) dy = G_\pm(x, N), \hspace{1cm} (2.21)$$

$$G_\pm(x, N) = G_\pm(x) \pm \int_0^{\pm N} H_\pm(y) F_\pm(x + y) dy.$$

From (2.13) and the estimates (2.4)–(2.5) we deduce $H_\pm \in L^\infty(\mathbb{R}_\pm) \cap C(\mathbb{R}_\pm)$. We also have

$$|G_\pm(x, N)| \leq C(N) \eta_\pm(x) \hspace{1cm} (2.22)$$

by the boundedness of $H_\pm$, the estimate (2.20), and monotonicity of $\eta_\pm(x)$. Now let

$$H_{\pm,0}(x) = G(x, N), \quad H_{\pm,n+1}(x) = \int_0^{\pm N} H_{\pm,n}(y) F_\pm(x + y) dy.$$  \hspace{1cm} (2.23)

If we show that

$$|H_{\pm,n}(x)| \leq C(N) \eta_\pm(x) \left( \pm C \int_0^{\pm N} \eta_\pm(y) dy \right)^n$$

the desired estimate for $H_\pm(x)$ follows immediately, because

$$|H_\pm(x)| \leq C(N) \eta_\pm(x) \sum_{n=0}^\infty \left( \pm C \int_0^{\pm N} \eta_\pm(y) dy \right)^n \leq \tilde{C}(N) \eta_\pm(x),$$

$\tilde{C}(N) = C(N)(1 - D(N))^{-1}$, and the value $N$ is a fixed constant for given potential $V$. So it remains to verify (2.23) by induction which is straightforward using (2.22), (2.18), and monotonicity of $\eta_\pm(x)$. \hfill \Box

For later use we note that in the resonant case the Jost solutions are dependent at $k = 0$. If we define $\gamma$ via

$$f_+(x, 0) = \gamma f_-(x, 0), \hspace{1cm} (2.24)$$

then a straightforward calculation using the scattering relations (2.8) as well as $|T(k)|^2 + |R_\pm(k)|^2 = 1$ shows

$$T(0) = \frac{2\gamma}{1 + \gamma^2}, \quad R_\pm(0) = \pm \frac{1 - \gamma^2}{1 + \gamma^2}. \hspace{1cm} (2.25)$$

In particular, all three quantities are real-valued since $f_+(x, 0) \in \mathbb{R}$ and hence $\gamma \in \mathbb{R}$.

To establish Theorem 1.1 we need the following generalization of Lemma 2.1.
Lemma 2.4. Let \( V \in L^1_{j+1} \) with \( j \geq 1 \). Then \( \frac{d^l}{dk^l} \left( \frac{h_\pm(x,k) - h_\pm(x,0)}{k} \right) \) as well as \( \frac{d^l}{dk^l} \left( \frac{h_+(x,k) - h_+(x,0)}{k} \right) \) are contained in \( \mathcal{A} \) for \( 0 \leq l \leq j-1 \). Moreover, for \( \pm x \geq 0 \), the \( \mathcal{A} \)-norms of these expressions do not depend on \( x \).

Proof. Using (2.3) and Fubini, a little calculation shows
\[
\frac{h_\pm(x,k) - h_\pm(x,0)}{k} = \pm 2i \int_0^{\pm \infty} B_\pm(x, z) \left( \int_y^z e^{\pm 2iky} dy \right) dz
\]
\[
= \pm 2i \int_0^{\pm \infty} e^{\pm 2iky} \left( \int_0^z B_\pm(x, z) dy \right) dy = 2i \int_0^{\pm \infty} K_\pm(x, y)e^{\pm 2iky} dy.
\]
Now after differentiating with respect to \( k \) the claim follows by (2.4). For the second item we can proceed exactly in the same way.

Similarly,

Lemma 2.5. Let \( V \in L^1_{j+1} \) with \( j \geq 1 \). Then \( \frac{d^l}{dk^l} \left( \frac{\Psi_\pm(k) - \Psi_\pm(0)}{k} \right) \in \mathcal{A} \) for \( 0 \leq l \leq j-1 \).

Proof. This follows as in the previous lemma using the estimate for \( H_\pm \) from Lemma 2.3.

Combining the last two lemmas we obtain:

Theorem 2.6. Let \( V \in L^1_{j+1} \) with \( j \geq 1 \). Then \( \frac{d^l}{dk^l} \left( \frac{T(k) - T(0)}{k} \right) \) and \( \frac{d^l}{dk^l} \left( \frac{R_\pm(k) - R_\pm(0)}{k} \right) \) are elements of \( \mathcal{A} \) for \( 0 \leq l \leq j-1 \).

3. Dispersive decay estimates

In this section we prove the integrable dispersive decay estimate (1.2) for the Schrödinger equation (1.1) in the resonant case. For the one-parameter group of (1.1) the spectral theorem and Stone’s formula imply
\[
e^{-itH} P_{ac} = \frac{1}{2\pi i} \int_0^\infty e^{-i\omega} (\mathcal{R}(\omega + i0) - \mathcal{R}(\omega - i0)) \, d\omega,
\]
where \( \mathcal{R}(\omega) = (H - \omega)^{-1} \) is the resolvent of the Schrödinger operator \( H \) and the limit is understood in the strong sense [10, Problem 4.3]. Given the Jost solutions we can express the kernel of the resolvent \( \mathcal{R}(\omega) \) for \( \omega = k^2 \pm i0 \), \( k > 0 \), as [10, Lemma 9.7]
\[
[\mathcal{R}(k^2 \pm i0)](x, y) = -\frac{f_+(y, \pm k)f_-(x, \pm k)}{W(\pm k)} = \frac{f_+(y, \pm k)f_-(x, \pm k)T(\pm k)}{2ik}
\]
for all \( x \leq y \) (and the positions of \( x, y \) reversed if \( x > y \)). Therefore, in the case \( x \leq y \), the integral kernel of \( e^{-itH} P_{ac} \) is given by
\[
[e^{-itH} P_{ac}](x, y) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i(tk^2 - |y-x|k)} h_+(y, k)h_-(x, k)T(k) dk,
\]
where the integral has to be understood as an improper integral. Another result that we need in order to obtain our decay estimates is the following variant of the van der Corput lemma [9, Lemma 5.4]:
Lemma 3.1. Consider the oscillatory integral \( I(t) = \int_{a}^{b} e^{it\phi(k)} f(k) dk \), where \( \phi(k) \) is a real-valued function. If \( \phi''(k) \neq 0 \) in \([a,b]\) and \( f \in A_1 \), then we have \( |I(t)| \leq C_2[t \min_{a \leq k \leq b} |\phi''(k)|]^{-1/2} \|f\|_{A_1} \) for \( t \geq 1 \), where \( C_2 \leq 2^{8/3} \) is the optimal constant from the van der Corput lemma.

Now we come to the proof of our main Theorem 1.1. We first give an alternate representation of our projection operator \((4\pi it)^{-\frac{1}{2}} P_0\):

Lemma 3.2 (\[10\]). The integral kernel of \((4\pi it)^{-\frac{1}{2}} P_0\), which is (per definition) given by \((4\pi it)^{-\frac{1}{2}} f_0(x) f_0(y)\), can also be written in the form

\[ \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i k^2 t} T(0) f_-(x,0) f_+(y,0) dk. \]

Proof. It is clear that \( f_0(x) = c_\pm f_\pm (x,0) \) and by our normalization \( c_-^2 + c_+^2 = 2 \). Using \((\ref{2.24})\) we have \( c_- = \gamma c_+ \) and hence \( c_+^2 = \frac{1+\gamma^2}{2} \). Moreover, \((\ref{2.25})\) implies \( c_+ c_- T(0) = 1 \) and using \( \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-it k^2} dk = (4\pi it)^{-\frac{1}{2}} \) the claim follows. \( \square \)

Finally we have all the ingredients needed to obtain Theorem 1.1.

Proof of Theorem 1.1. For the kernel of \( e^{-itH} P_{ac} \) we use \((\ref{3.3})\). Then by Lemma 3.2 the kernel \( G(x,y,t) \) of \( e^{-itH} P_{ac} - (4\pi it)^{-\frac{1}{2}} P_0 \) can now be written as

\[ G(x,y,t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i k^2 t} (e^{iy-x} k h_+(y,k) h_-(x,k) T(k) - h_+(y,0) h_-(x,0) T(0)) dk. \]

Integrating this formula by parts, we obtain

\[ G(x,y,t) = \frac{1}{4\pi it} \int_{-\infty}^{\infty} e^{-it k^2} S(x,y,k) dk, \]

where

\[ S(x,y,k) = \frac{\partial}{\partial k} \left( \frac{e^{iy-x} k h_+(y,k) h_-(x,k) T(k) - h_+(y,0) h_-(x,0) T(0)}{k} \right). \]

Now we apply Lemma 3.1 to get the desired \( t^{-\frac{3}{2}} \) time-decay. So in order to finish our proof, it remains to bound the \( A \)-norm of \( S(x,y,k) \) which follows from the lemma below. \( \square \)

Lemma 3.3. Assume \( V \in L^3_+ \). Then

\[ \|S(x,y,\cdot)\|_A \leq C(|x| + |y|)^2. \]

Proof. We assume w.l.o.g. \( x \leq y \) and distinguish the cases (i) \( x \leq 0 \leq y \), (ii) \( 0 \leq x \leq y \) and (iii) \( x \leq y \leq 0 \). Introduce the function \( g(x,y,k) := T(k) h_+(y,k) h_-(x,k) \). Then \( S(x,y,k) \) can be written as:

\[ S(x,y,k) = \frac{\partial}{\partial k} \left( \frac{e^{iy-x} k - 1}{k} \right) g(x,y,k) + \frac{e^{iy-x} k - 1}{k} \frac{\partial}{\partial k} g(x,y,k) + \frac{\partial}{\partial k} \left( \frac{g(x,y,k) - g(x,y,0)}{k} \right). \]

The \( A \)-norm of \( \frac{e^{iy-x} k - 1}{k} \) is bounded by \( C(|x| + |y|) \) and that of its derivative by \( C(|x| + |y|)^2 \). So it remains to consider the \( A_1 \)-norms of \( g(x,y,k) \) and \( \frac{\partial}{\partial k} g(x,y,k), \)
and $\mathcal{A}$-norm of $\frac{\partial}{\partial s} P(x, y, k)$, where

$$P(x, y, k) = \frac{g(x, y, k) - g(x, y, 0)}{k}.$$  

We start with case (i). Then $g(x, y, k) \in \mathcal{A}_1$ with $\mathcal{A}_1$-norm independent of $x$ and $y$. After applying the product rule Lemmas 2.1 and 2.6 imply $\|\frac{\partial}{\partial s} g(x, y, k)\|_{\mathcal{A}} \leq C$. Moreover,

$$P(x, y, k) = \frac{T(k) - T(0)}{k} h_+(y, k) h_-(x, k) + \frac{h_+(y, k) - h_+(0)}{k} h_-(x, k) T(0) + \frac{h_-(x, k) - h_-(0)}{k} h_+(y, 0) T(0).$$

Taking here the derivative with respect to $k$ and invoking Lemma 2.1 and Lemma 2.6 we are done in this case. In the cases (ii) and (iii) we use the scattering relations (2.8) to see that the following representations are valid:

$$g(x, y, k) = \begin{cases} h_+(y, k) \left( R_+(k) h_+(x, k) e^{2i \pi k} + h_+(x, -k) \right), & 0 \leq x \leq y, \\ h_-(x, k) \left( R_-(k) h_-(y, k) e^{-2i \pi k} + h_-(y, -k) \right), & x \leq y \leq 0. \end{cases}$$

Thus $g(x, y, k)$ has an $\mathcal{A}_1$-norm independent of $x$ and $y$, since for any function $f(k) \in \mathcal{A}$ and any real $s$ we have $f(k) e^{i k s} \in \mathcal{A}$ with the norm independent of $s$. If we take the derivative with respect to $k$, again everything is contained in $\mathcal{A}$ by Lemma 2.1 and Lemma 2.6, however we get additional terms from the derivatives of $e^{2i \pi k}$ and $e^{-2i \pi k}$. So it follows that the $\mathcal{A}$-norm of $\frac{\partial}{\partial s} g(x, y, k)$ is at most proportional to $|x|$ or $|y|$ respectively. Finally, let us have a look at $\frac{\partial}{\partial s} P(x, y, k)$. We observe that in case (ii) one can represent $P$ as

$$P(x, y, k) = \frac{h_+(y, k) - h_+(0)}{k} h_+(x, -k) + \frac{h_+(x, -k) - h_+(0)}{k} h_+(y, 0) + \frac{R_+(k) - R_+(0)}{k} h_+(x, k) h_+(y, k) e^{2i \pi k} + \frac{e^{2i \pi k} - 1}{k} R_+(0) h_+(x, k) h_+(y, k) + \frac{h_+(x, k) - h_+(0)}{k} h_+(y, k) R_+(0) h_+(x, k) R_+(0).$$

Here again every summand is an element of $\mathcal{A}$ by Lemma 2.1 and Lemma 2.6. Since the derivative of $\frac{e^{2i \pi k} - 1}{k}$ also occurs here, we conclude that the $\mathcal{A}$-norm of $\frac{\partial}{\partial s} P(x, y, k)$ is at most proportional to $|x|^2$. From the same reasons in the case (iii) this derivative will be proportional to $|y|^2$.
