RESEARCH INTERESTS

P.'s research area is PDEs and the Calculus of Variations, and his research program involves the investigation of Continuum and Molecular Mechanics models that find applications in Materials Science. The focus is on free boundary problems and atomistic models motivated by applications in the study of the epitaxial growth of thin films, the optimal shapes of crystal interfaces, and the stability of molecular structures. The methodology includes configurational energy minimization, isoperimetric characterization, Γ -convergence, dimension reduction, and the minimizing-movement method.
