Profile of a permutation group, a finite example

- Permutation group G

Profile of a permutation group, a finite example

- Permutation group G \rightarrow induced action on *subsets*

Profile of a permutation group, a finite example

- Permutation group G \rightarrow induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

Profile of a permutation group, a finite example

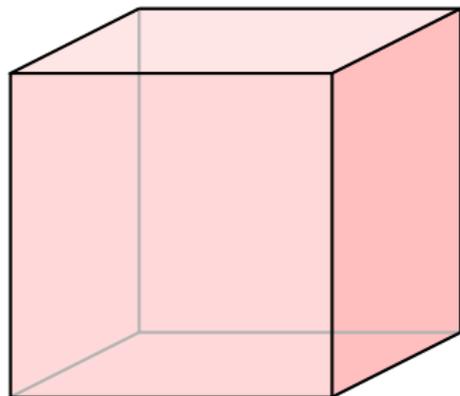

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

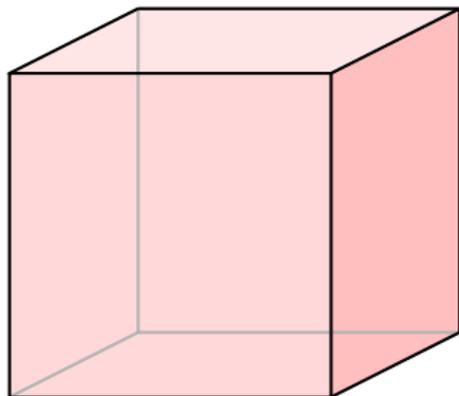

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0			5	
1			6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

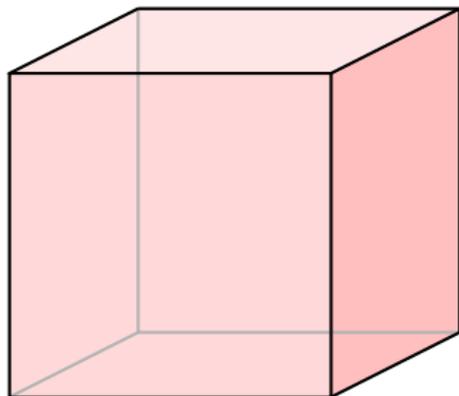

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1			6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

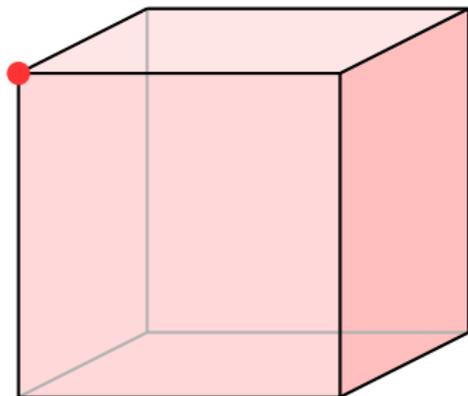

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1			6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

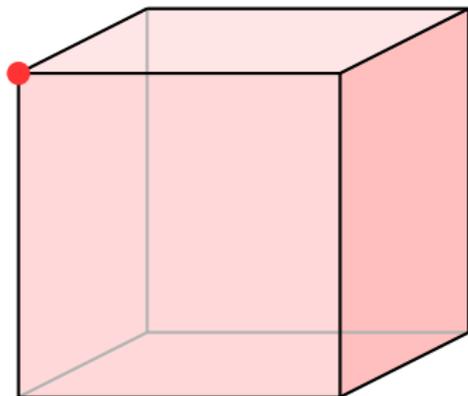

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

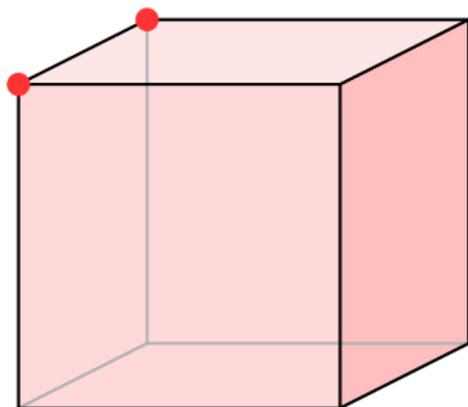

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

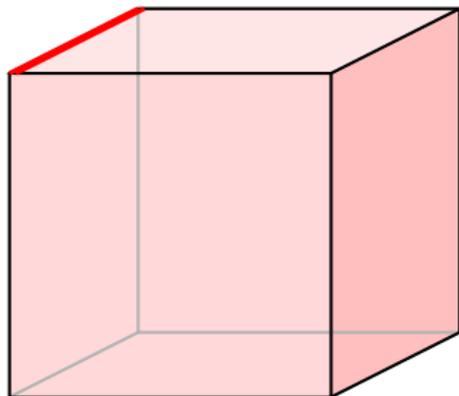

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

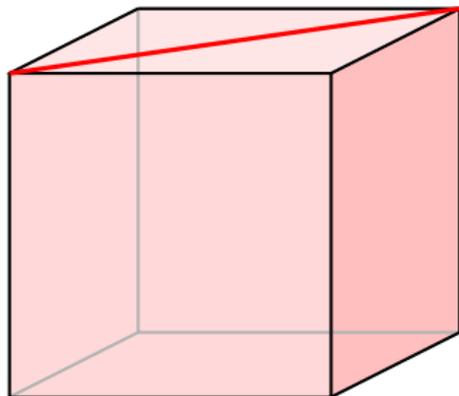

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

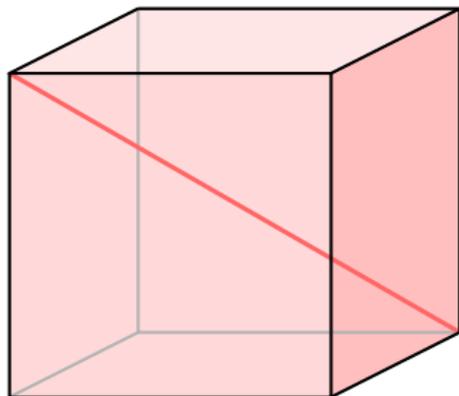

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2			7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

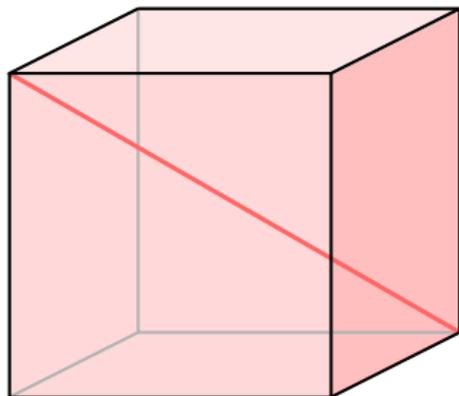

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

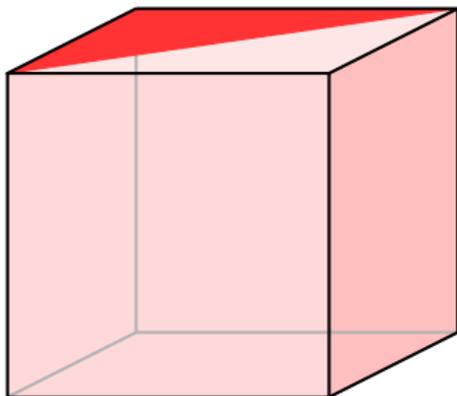

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

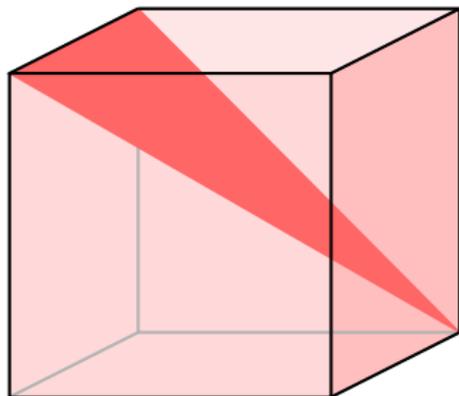

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

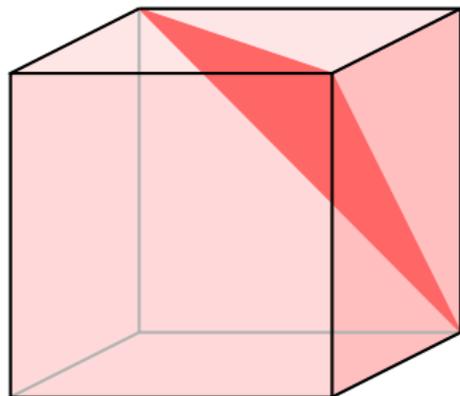

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3			8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

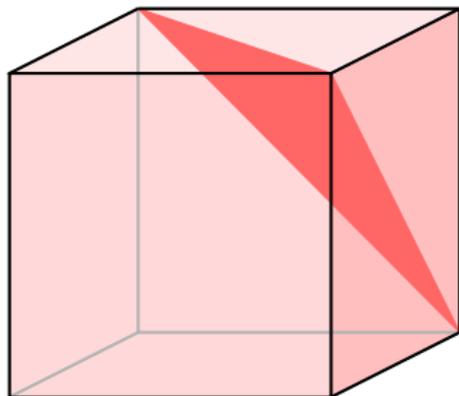

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3	3		8	
4			> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

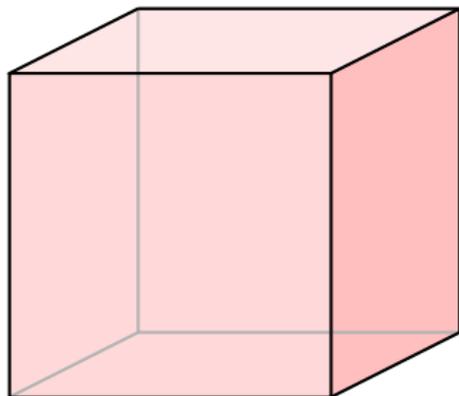

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	
1	1		6	
2	3		7	
3	3		8	
4	6		> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

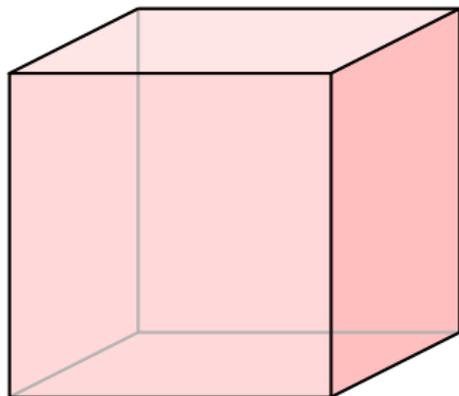

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	3
1	1		6	
2	3		7	
3	3		8	
4	6		> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

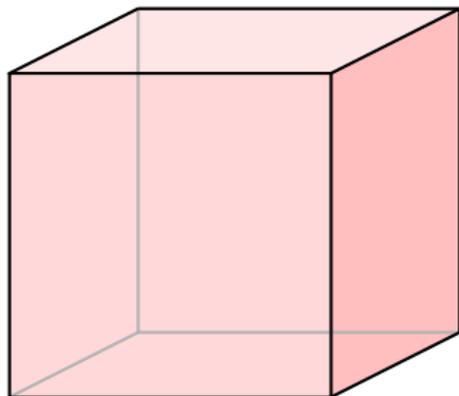

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	3
1	1		6	3
2	3		7	
3	3		8	
4	6		> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

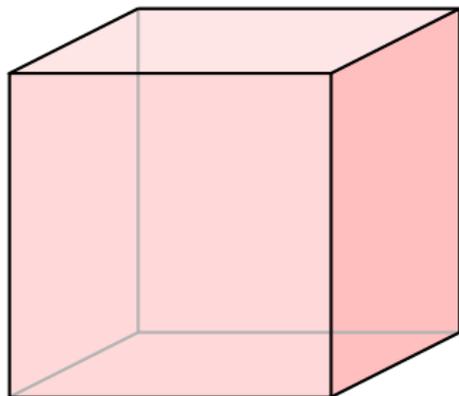

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	3
1	1		6	3
2	3		7	1
3	3		8	
4	6		> 8	

Profile of a permutation group, a finite example

- Permutation group $G \rightarrow$ induced action on *subsets*
- Orbit of n -subsets = orbit of *degree* n

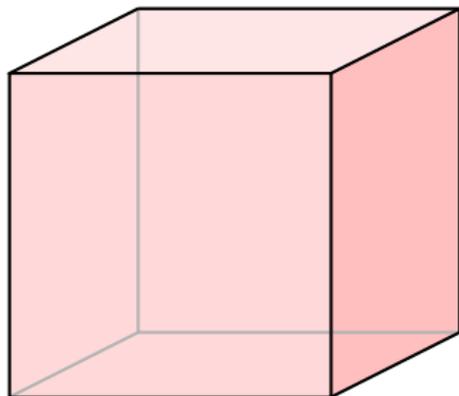

Profile of G

$$\varphi_G(n) = \# \text{ orbits of degree } n$$

Example

The group of symmetries of the cube D_8

n	φ_G		n	φ_G
0	1		5	3
1	1		6	3
2	3		7	1
3	3		8	1
4	6		> 8	0

Series of the profile

$$P_{D_8}(z) = 1 + 1z + 3z^2 + 3z^3 + 6z^4 + 3z^5 + 3z^6 + 1z^7 + 1z^8$$

Series of the profile

$$P_{D_8}(z) = 1 + 1z + 3z^2 + 3z^3 + 6z^4 + 3z^5 + 3z^6 + 1z^7 + 1z^8$$

$$G \text{ infinite} \quad \rightarrow \quad \mathcal{H}_G(z) = \sum_n \varphi_G(n) z^n$$

Series of the profile

$$P_{D_8}(z) = 1 + 1z + 3z^2 + 3z^3 + 6z^4 + 3z^5 + 3z^6 + 1z^7 + 1z^8$$

$$G \text{ infinite} \quad \rightarrow \quad \mathcal{H}_G(z) = \sum_n \varphi_G(n) z^n$$

Hypothesis

G is *P-oligomorphic*: φ_G is bounded by a polynomial in n

Series of the profile

$$P_{D_8}(z) = 1 + 1z + 3z^2 + 3z^3 + 6z^4 + 3z^5 + 3z^6 + 1z^7 + 1z^8$$

$$G \text{ infinite} \quad \rightarrow \quad \mathcal{H}_G(z) = \sum_n \varphi_G(n) z^n$$

Hypothesis

G is P -oligomorphic: φ_G is bounded by a polynomial in n

Example

$$\mathcal{H}_{\mathfrak{S}_\infty}(z) = 1 + z + z^2 + \cdots = \frac{1}{1-z}$$

Series of the profile

$$P_{D_8}(z) = 1 + 1z + 3z^2 + 3z^3 + 6z^4 + 3z^5 + 3z^6 + 1z^7 + 1z^8$$

$$G \text{ infinite} \quad \rightarrow \quad \mathcal{H}_G(z) = \sum_n \varphi_G(n) z^n$$

Hypothesis

G is P -oligomorphic: φ_G is bounded by a polynomial in n

Example

$$\mathcal{H}_{\mathfrak{S}_\infty}(z) = 1 + z + z^2 + \cdots = \frac{1}{1-z}$$

Conjecture 1 - Cameron, 70's

$$G \text{ } P\text{-oligomorphic} \quad \Rightarrow \quad \mathcal{H}_G(z) = \frac{N(z)}{\prod_i (1-z^{d_i})} \text{ with } N(z) \in \mathbb{Z}[z]$$

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product
- graded according to the orbital degree:

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product
- graded according to the orbital degree:
 $orb_1 \cdot orb_2 =$ linear combination of orbits of degree $d_1 + d_2$

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product
- graded according to the orbital degree:
 - $orb_1 \cdot orb_2 =$ linear combination of orbits of degree $d_1 + d_2$
- $\dim(\mathcal{A}_n) = \varphi_G(n)$

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product
- graded according to the orbital degree:
 $orb_1 \cdot orb_2 =$ linear combination of orbits of degree $d_1 + d_2$
- $\dim(\mathcal{A}_n) = \varphi_G(n)$, so $\mathcal{H}_G(z) = \sum_n \dim(\mathcal{A}_n) z^n$

Orbit algebra

Orbit algebra (Cameron, 80's)

Structure of graded algebra $\mathcal{A}_G = \bigoplus_n \mathcal{A}_n$ on the orbits

- combinatorial description of the product
- graded according to the orbital degree:
 - $orb_1 \cdot orb_2 =$ linear combination of orbits of degree $d_1 + d_2$
- $\dim(\mathcal{A}_n) = \varphi_G(n)$, so $\mathcal{H}_G(z) = \sum_n \dim(\mathcal{A}_n) z^n$

Conjecture 2 (stronger) - Macpherson, 85

G P -oligomorphic $\Rightarrow \mathcal{A}_G$ is finitely generated

Block systems

Block system

- Equivalence relation preserved by the group

Block systems

Block system

- Equivalence relation preserved by the group
- Blocks = the classes

Block systems

Block system

- Equivalence relation preserved by the group
- Blocks = the classes
- G acts by permutation on the blocks

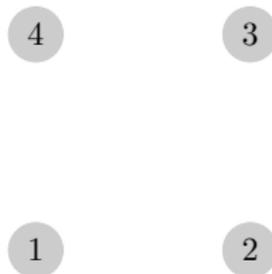

Block systems

Not a block system \rightarrow

The complete primitive P -oligomorphic groups

G_∞

The complete primitive P -oligomorphic groups

Macpherson:

G P -oligomorphic with no non trivial blocks $\Rightarrow \varphi_G(n) = 1$

G_∞

The complete primitive P -oligomorphic groups

Macpherson:

G P -oligomorphic with no non trivial blocks $\Rightarrow \varphi_G(n) = 1$

G_∞

Theorem (Classification, Cameron)

Only 5 complete groups such that $\varphi_G(n) = 1 \quad \forall n$

The complete primitive P -oligomorphic groups

Macpherson:

G P -oligomorphic with no non trivial blocks $\Rightarrow \varphi_G(n) = 1$

\mathfrak{S}_∞

Theorem (Classification, Cameron)

Only 5 complete groups such that $\varphi_G(n) = 1 \quad \forall n$

- $\text{Aut}(\mathbb{Q})$: automorphisms of the rational chain
- $\text{Rev}(\mathbb{Q})$: generated by $\text{Aut}(\mathbb{Q})$ and one reflection
- $\text{Aut}(\mathbb{Q}/\mathbb{Z})$, preserving the circular order
- $\text{Rev}(\mathbb{Q}/\mathbb{Z})$: generated by $\text{Aut}(\mathbb{Q}/\mathbb{Z})$ and a reflection
- \mathfrak{S}_∞ : the symmetric group

The complete primitive P -oligomorphic groups

Macpherson:

G P -oligomorphic with no non trivial blocks $\Rightarrow \varphi_G(n) = 1$

\mathfrak{S}_∞

Theorem (Classification, Cameron)

Only 5 complete groups such that $\varphi_G(n) = 1 \quad \forall n$

- $\text{Aut}(\mathbb{Q})$: automorphisms of the rational chain
- $\text{Rev}(\mathbb{Q})$: generated by $\text{Aut}(\mathbb{Q})$ and one reflection
- $\text{Aut}(\mathbb{Q}/\mathbb{Z})$, preserving the circular order
- $\text{Rev}(\mathbb{Q}/\mathbb{Z})$: generated by $\text{Aut}(\mathbb{Q}/\mathbb{Z})$ and a reflection
- \mathfrak{S}_∞ : the symmetric group

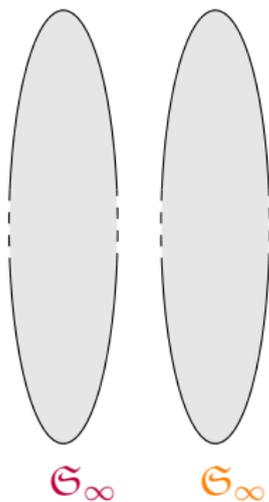

Well known, nice groups (called *highly homogeneous*).
In particular, their orbit algebra is finitely generated.

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

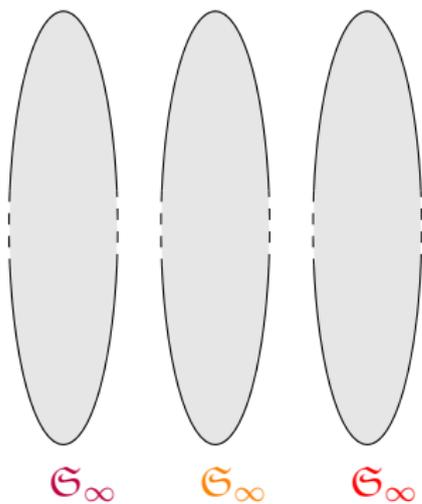

\mathfrak{S}_∞

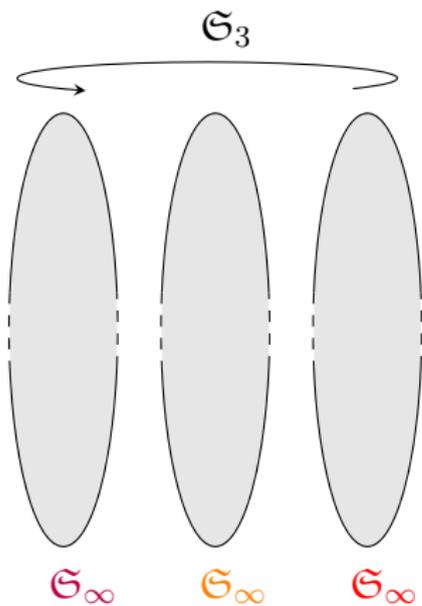

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

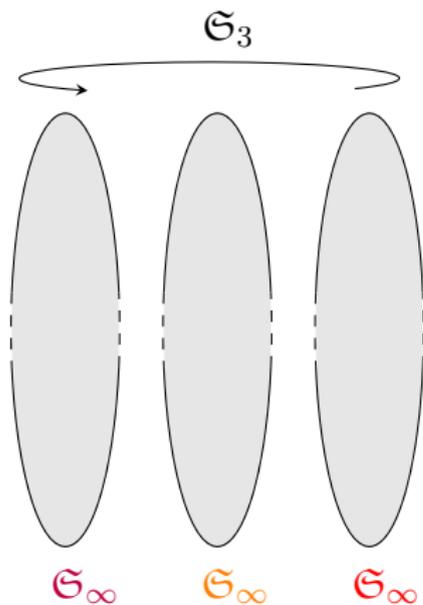

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$ 

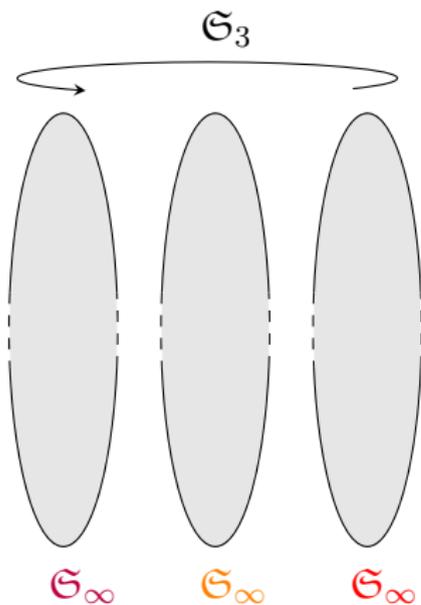

Wreath product

 $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$

Wreath product

$$\mathfrak{S}_\infty \wr \mathfrak{S}_3 \simeq \mathfrak{S}_\infty^3 \rtimes \mathfrak{S}_3$$

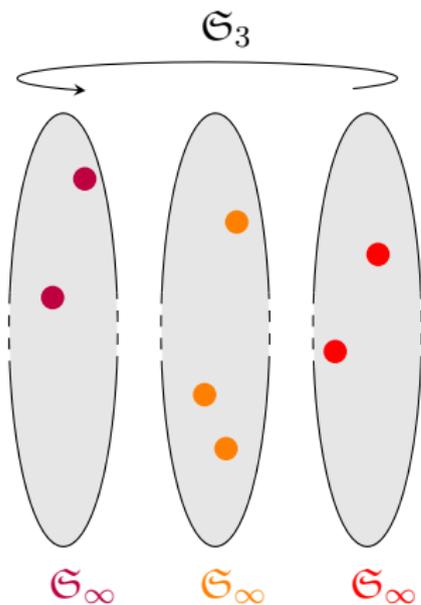

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$ 

Wreath product

$$\mathfrak{S}_\infty \wr \mathfrak{S}_3 \simeq \mathfrak{S}_\infty^3 \rtimes \mathfrak{S}_3$$

Subset of shape $2, 3, 2 \rightarrow x_1^2 x_2^3 x_3^2$

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$ 

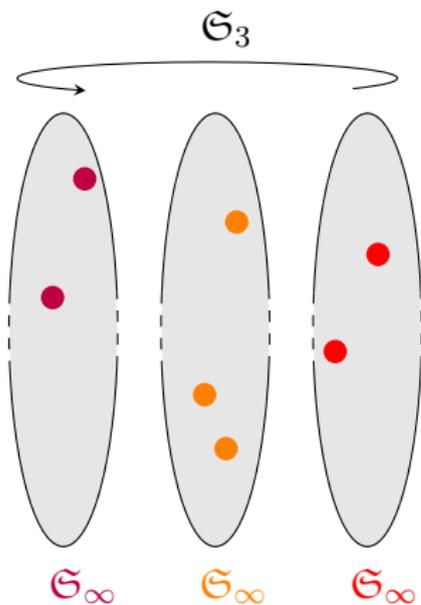

Wreath product

$$\mathfrak{S}_\infty \wr \mathfrak{S}_3 \simeq \mathfrak{S}_\infty^3 \rtimes \mathfrak{S}_3$$

Subset of shape $2, 3, 2 \rightarrow x_1^2 x_2^3 x_3^2$

Orbits of subsets

\leftrightarrow symmetric polynomials in x_1, x_2, x_3

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$ 

Wreath product

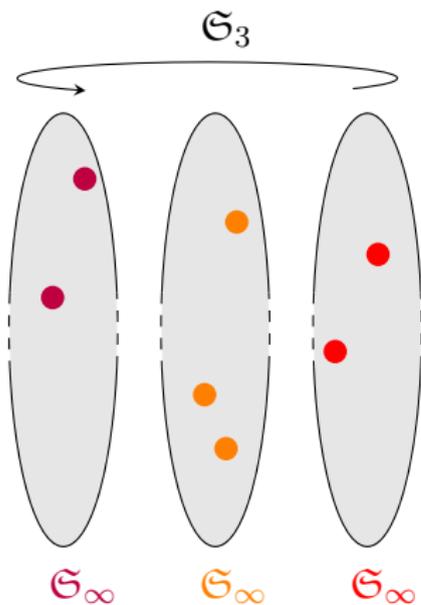

$$\mathfrak{S}_\infty \wr \mathfrak{S}_3 \simeq \mathfrak{S}_\infty^3 \rtimes \mathfrak{S}_3$$

Subset of shape $2, 3, 2 \rightarrow x_1^2 x_2^3 x_3^2$

Orbits of subsets

\leftrightarrow symmetric polynomials in x_1, x_2, x_3

$$\mathcal{A}_{\mathfrak{S}_\infty \wr \mathfrak{S}_3} \simeq \text{Sym}_3[X] = \mathbb{Q}[X]^{\mathfrak{S}_3}$$

An infinite example: $\mathfrak{S}_\infty \wr \mathfrak{S}_3$ 

Wreath product

$$\mathfrak{S}_\infty \wr \mathfrak{S}_3 \simeq \mathfrak{S}_\infty^3 \rtimes \mathfrak{S}_3$$

Subset of shape $2, 3, 2 \rightarrow x_1^2 x_2^3 x_3^2$

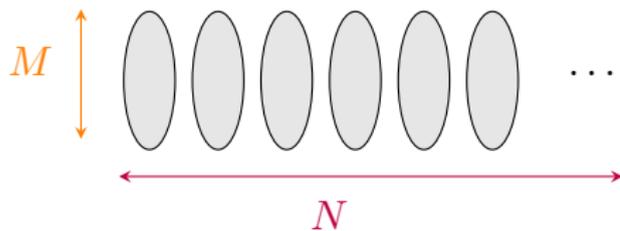

Orbits of subsets

\leftrightarrow symmetric polynomials in x_1, x_2, x_3

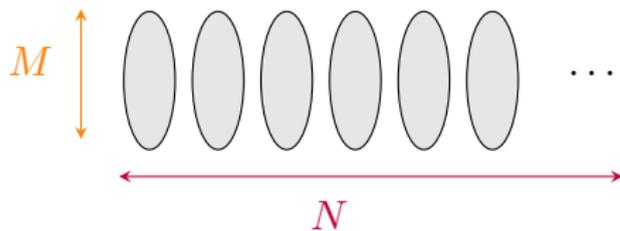

$$\mathcal{A}_{\mathfrak{S}_\infty \wr \mathfrak{S}_3} \simeq \text{Sym}_3[X] = \mathbb{Q}[X]^{\mathfrak{S}_3}$$

One can obtain functions counting integer partitions, combinations, P -partitions (with optional length and/or height restrictions) as profiles of wreath products...

Lower bound

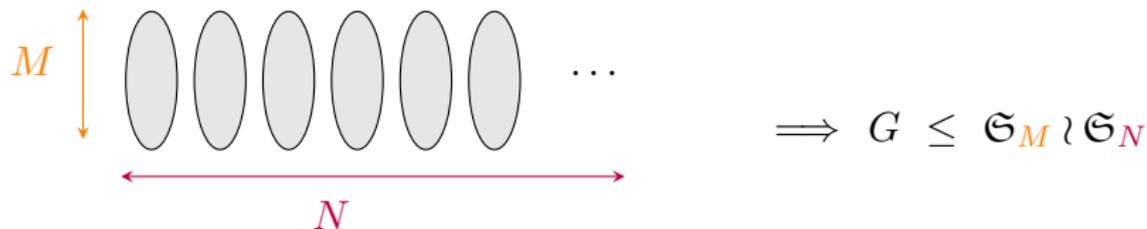

Lower bound

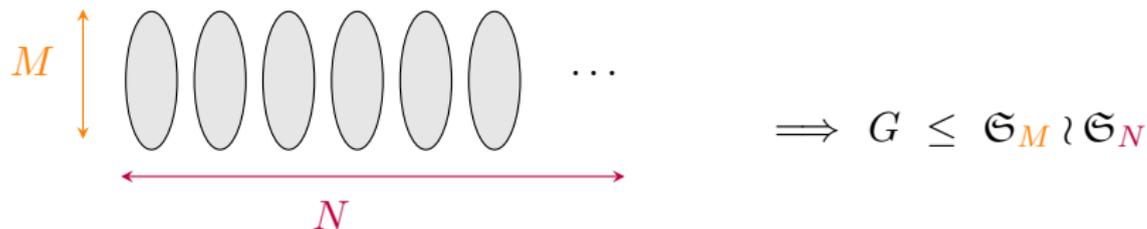

$$\Rightarrow G \leq \mathfrak{S}_M \wr \mathfrak{S}_N$$

Lower bound

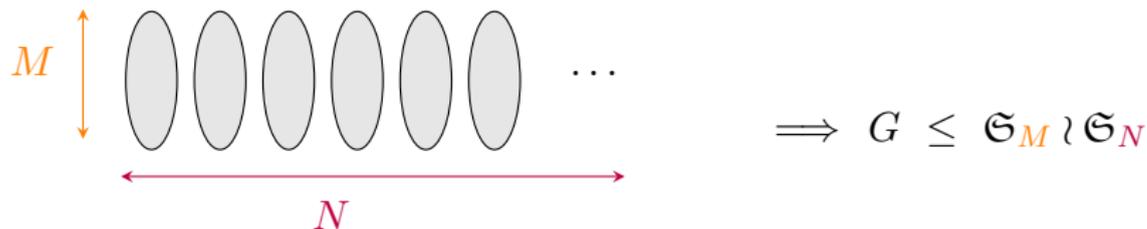

Two cases if G is P -oligomorphic :

Lower bound

Two cases if G is P -oligomorphic :

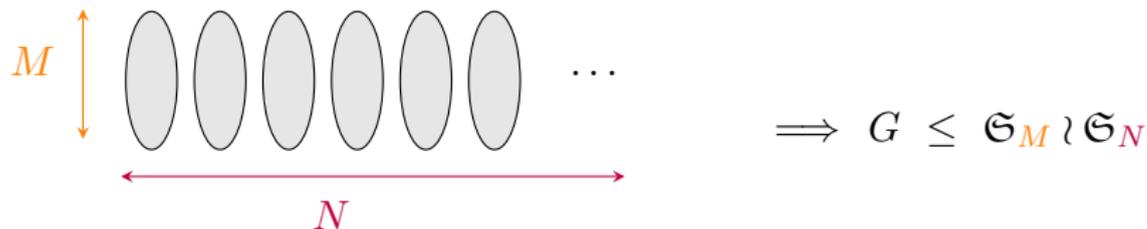

Lower bound

Two cases if G is P -oligomorphic :

- $M < \infty$

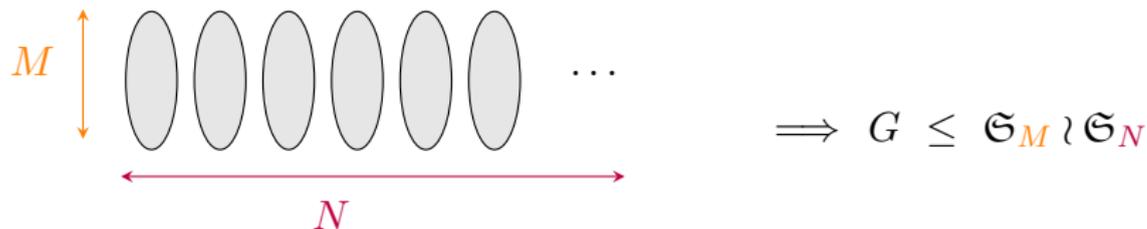

Lower bound

Two cases if G is P -oligomorphic :

- $M < \infty$
- $N < \infty$

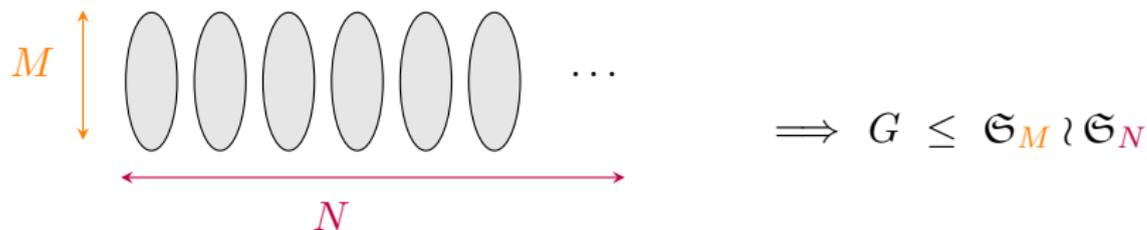

Lower bound

Two cases if G is P -oligomorphic:

- $M < \infty$ $\longrightarrow \varphi_G(n) \geq O(n^{M-1})$
- $N < \infty$

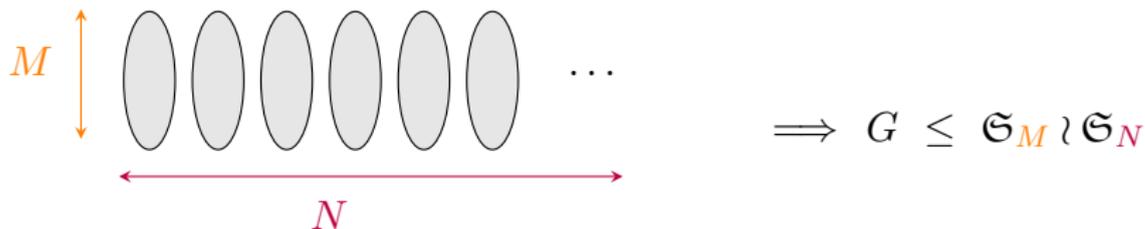

Lower bound

Two cases if G is P -oligomorphic:

- $M < \infty$ $\rightarrow \varphi_G(n) \geq O(n^{M-1})$
- $N < \infty$ $\rightarrow \varphi_G(n) \geq O(n^{N-1})$

Lower bound

Two cases if G is P -oligomorphic:

- $M < \infty$ $\rightarrow \varphi_G(n) \geq O(n^{M-1})$
- $N < \infty$ $\rightarrow \varphi_G(n) \geq O(n^{N-1})$

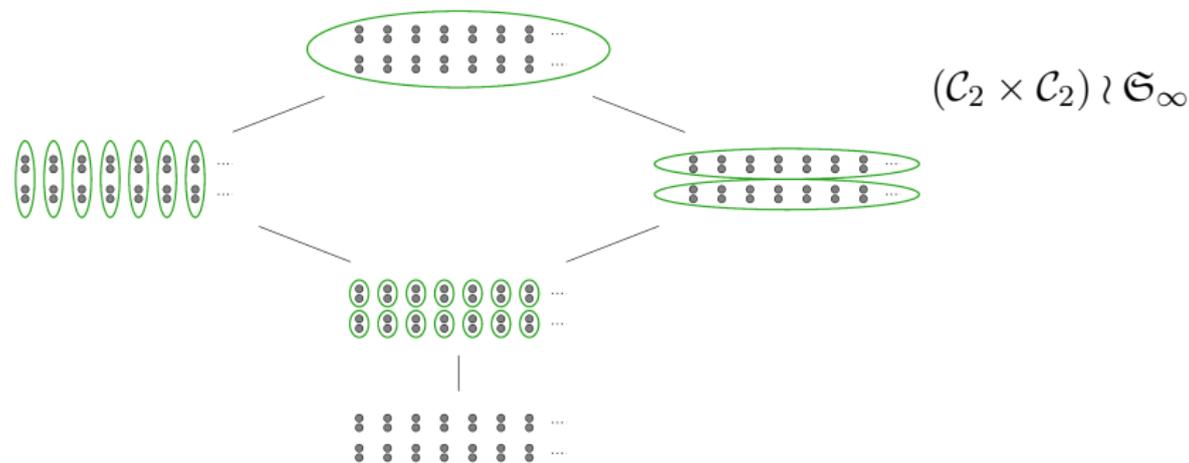

Better have **big** finite blocks and/or "small" infinite ones...

Lattices of block systems

Lattice of partitions \rightarrow structure of *lattice* on block systems

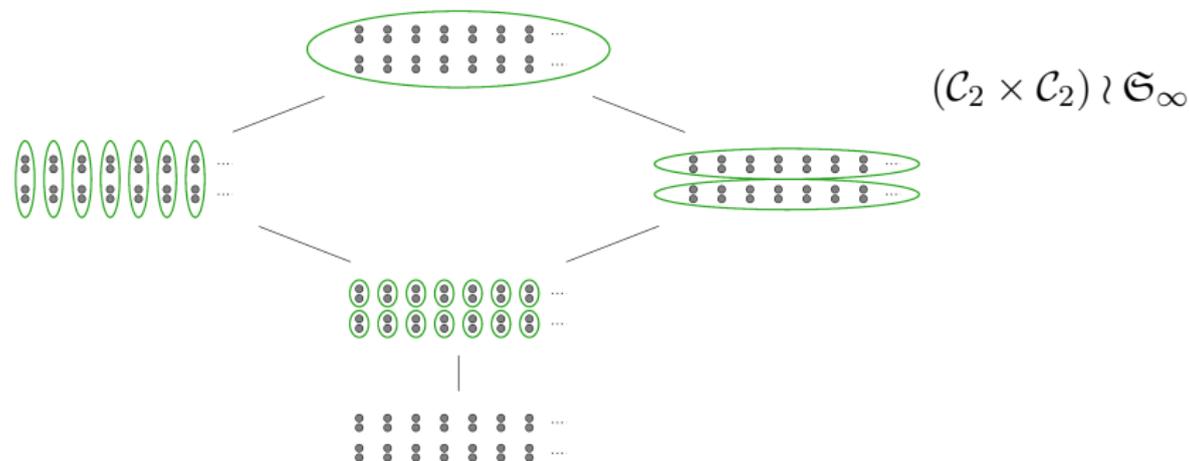

Lattices of block systems

Lattice of partitions \rightarrow structure of *lattice* on block systems

Lattices of block systems

Lattice of partitions \rightarrow structure of *lattice* on block systems

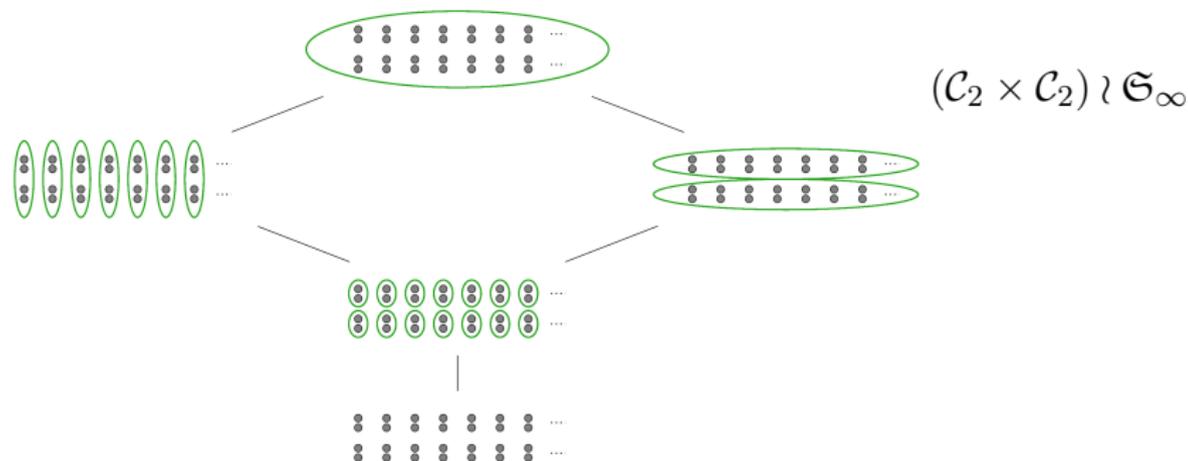

Non trivial fact

- {Systems with $< \infty$ blocks only} = sublattice with maximum
- {Systems with ∞ blocks only} = sublattice with minimum

Lattices of block systems

Lattice of partitions \rightarrow structure of *lattice* on block systems

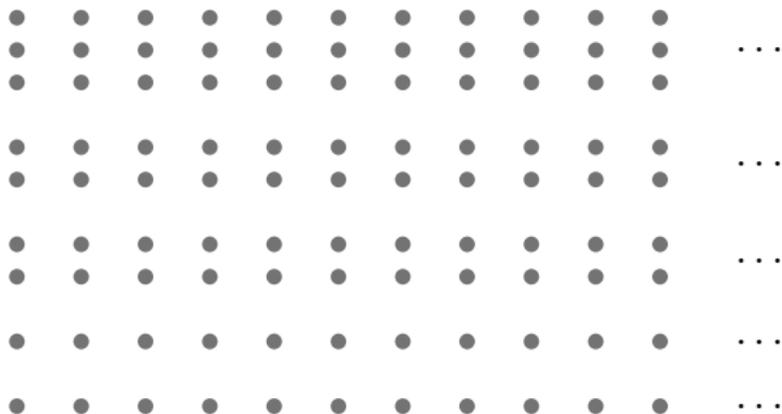

Non trivial fact

- {Systems with $< \infty$ blocks only} = sublattice with maximum
- {Systems with ∞ blocks only} = sublattice with minimum

Remark. If G is P -oligomorphic, both of them are actually finite!

 - Proof in the infinite case: always some $H_0, H, H, H \dots$

Classification

One superblock $\Rightarrow G = [H_0, H_\infty]$

$\mathcal{A}_G \simeq \mathbb{Q}[(X_{orb})_{orb}]^{H_0}$, where orb runs through the orbits of H

One superblock: classification

- The tower determines G (uses the *subdirect product*)
- Computer exploration on finitely many blocks
 - Observation: always some $H_0, H, H, H, \dots, H, H_s$
 - Proof in the infinite case: always some $H_0, H, H, H \dots$

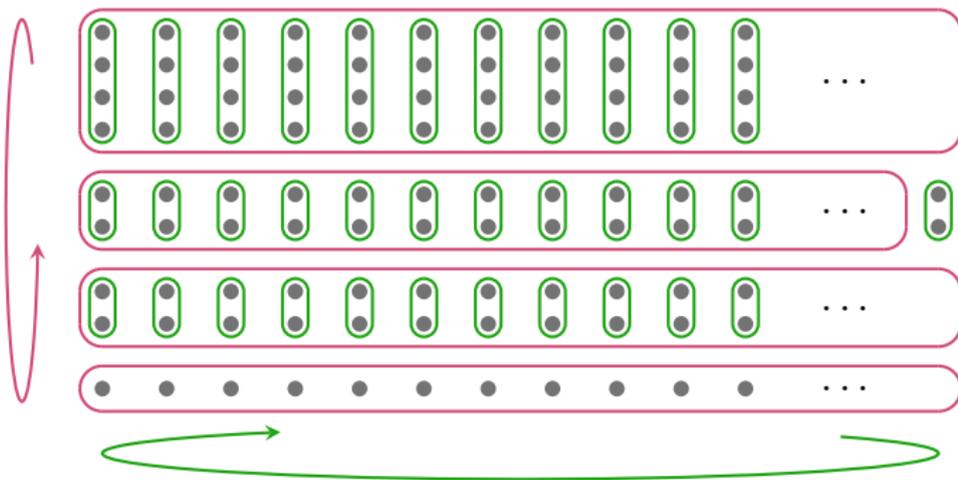

Classification

One superblock $\Rightarrow G = [H_0, H_\infty]$

$\mathcal{A}_G \simeq \mathbb{Q}[(X_{orb})_{orb}]^{H_0}$, where orb runs through the orbits of H

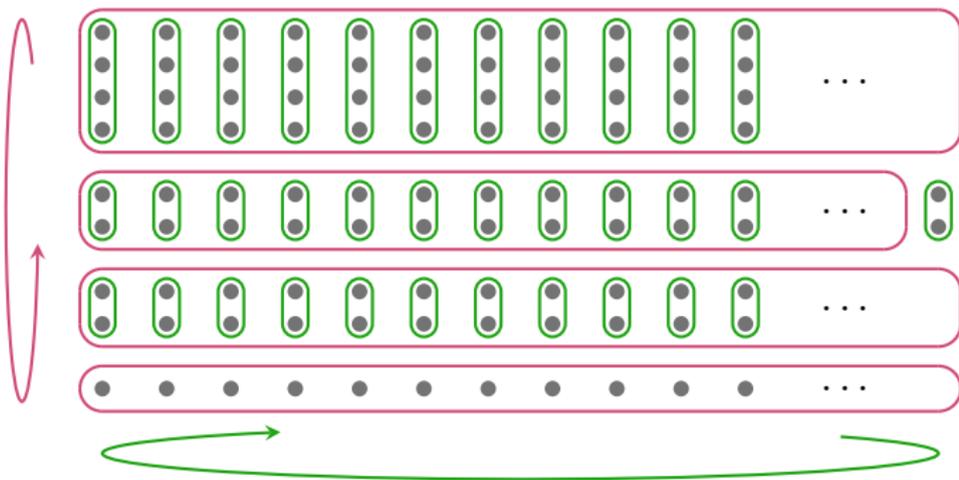

In particular, both conjectures hold.

General case: minimal subgroup of finite index

For each orbit of blocks, choose

- One **group of profile 1**
 - Has to be \mathfrak{S}_∞ if the blocks are singletons
 - Can alternatively be Id_1 for at most one orbit of one block
- One normal subgroup H of $H_0 = G_{0|B}$ for B in the orbit

$H' \wr \mathfrak{S}_\infty$

$H \wr \mathfrak{S}_\infty$

$H \wr \mathfrak{S}_\infty$

$\text{Id} \wr \text{Aut}(\mathbb{Q})$

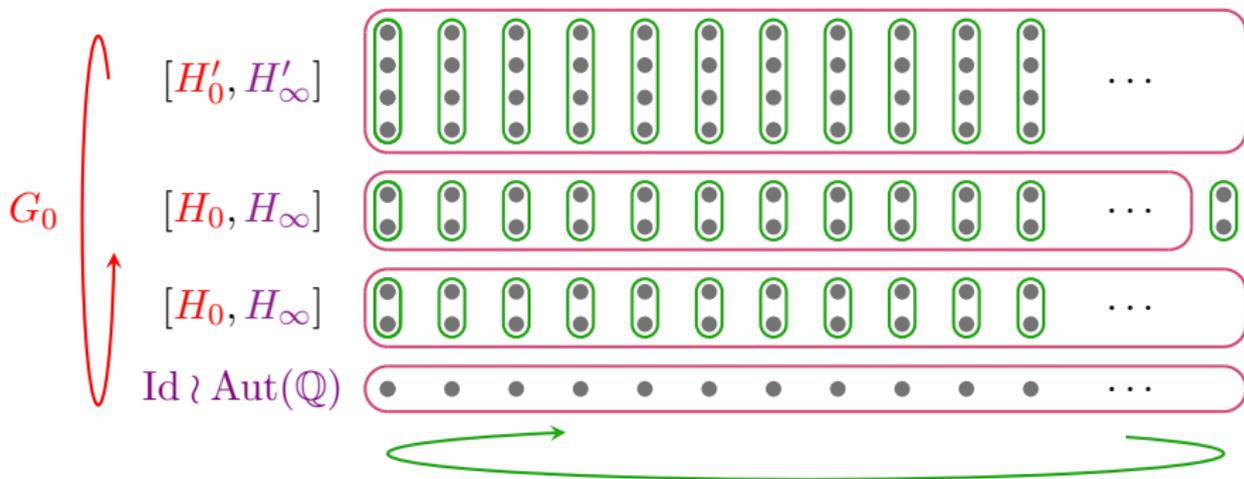

Classification of P -oligomorphic groups

G_0 a finite permutation group, \mathcal{B}_0 a block system.

For each orbit of blocks, choose

- One group of profile 1
 - Has to be \mathfrak{S}_∞ if the blocks are singletons
 - Can alternatively be Id_1 for at most one orbit of one block
- One normal subgroup H of $H_0 = G_{0|B}$ for B in the orbit

Thank you for your attention !

Context

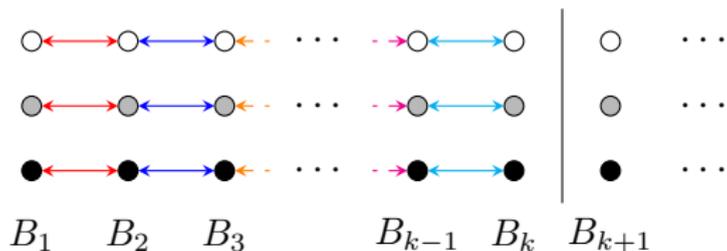

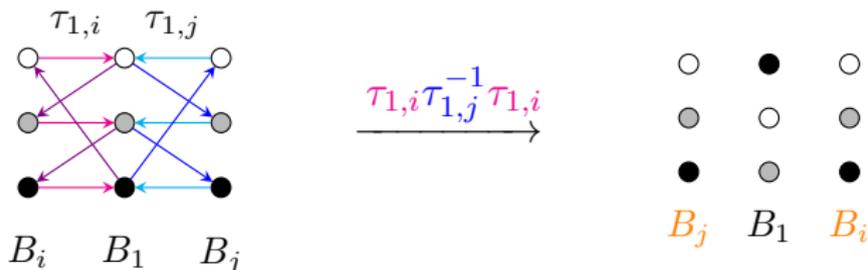

- G permutation group of a countably infinite set E
- Profile φ_G : counts the orbits of finite subsets of E
- Hypothesis: $\varphi_G(n)$ bounded by a polynomial
- Conjecture (Cameron): rational form of the generating series
- Conjecture (Macpherson): finite generation of the orbit algebra

Results

- Both conjectures hold !
- Classification of P -oligomorphic permutation groups
- The orbit algebra is an algebra of invariants (up to some idempotents)

The tower determines the group (1): "straight \mathfrak{S}_∞ "

G contains a set of "straight" swaps of blocks

Subdirect product

Subdirect product of G_1 and G_2

- Formalizes the *synchronization* between G_1 and G_2
- Subgroup of $G_1 \times G_2$ (with canonical projections G_1 and G_2)
- $E = E_1 \sqcup E_2$ stable $\Rightarrow G$ subdirect product of $G|_{E_1}$ and $G|_{E_2}$

Synchronization in a subdirect product

Let $N_1 = \text{Fix}_G(E_2)$ and $N_2 = \text{Fix}_G(E_1)$.

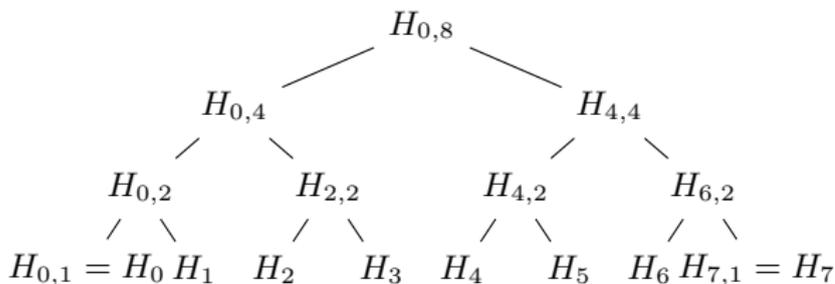

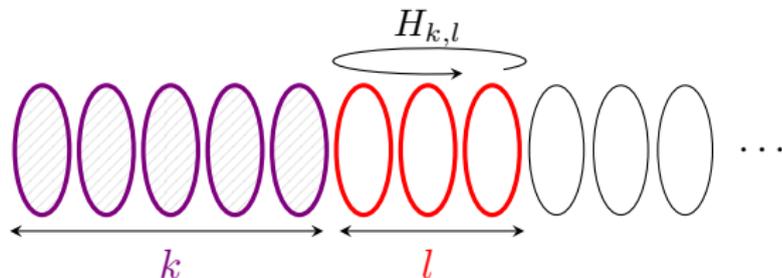

$$\frac{G_1}{N_1} \simeq \frac{G}{N_1 \times N_2} \simeq \frac{G_2}{N_2}$$

A subdirect product with explicit N_i 's is explicit.

Remark. N_1 and N_2 are *normal* in G_1 and G_2 , so the possibilities of synchronization of a group is linked to its normal subgroups.

The tower determines the group (2): $\text{Stab}_G(\text{blocks})$

$\text{Stab}_G(\text{blocks}) =$ explicit subdirect product of the H_i

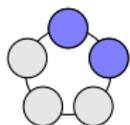

← The tower
determines
 $\text{Stab}_G(\text{blocks})$

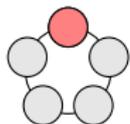

$G \simeq \text{Stab}_G(\text{blocks}) \rtimes \text{"straight } \mathfrak{S}_\infty \text{"} \rightarrow \text{Ok}$

 \end{array}$$

The diagrams are 5-nodes arranged in a circle with edges (1,2), (2,3), (3,4), (4,5), (5,1). The nodes are numbered 1 to 5 clockwise starting from the top.

In the end:

In the end:

$$\begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} \times \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} = 2 \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} + \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array}$$

Non trivial fact

Product well defined (and graded) on the space of orbits.

In the end:

$$\begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} \times \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} = 2 \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array} + \begin{array}{c} \bullet \\ \circ \quad \circ \\ \circ \quad \circ \end{array}$$

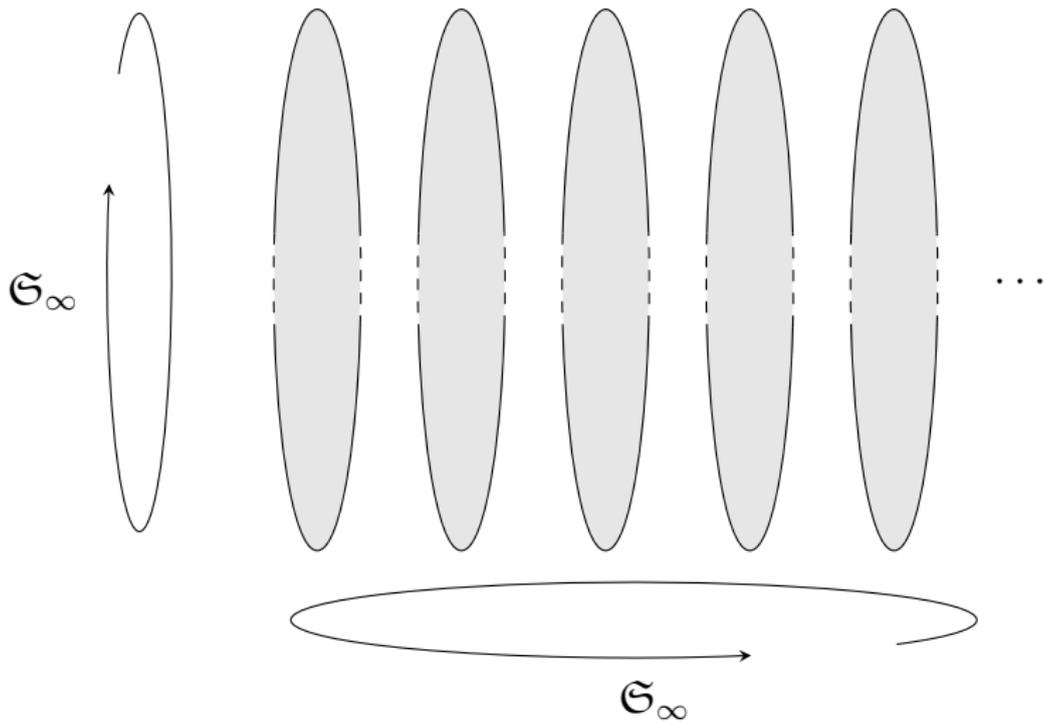

Non trivial fact

Product well defined (and graded) on the space of orbits.

→ **The orbit algebra of a permutation group**

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

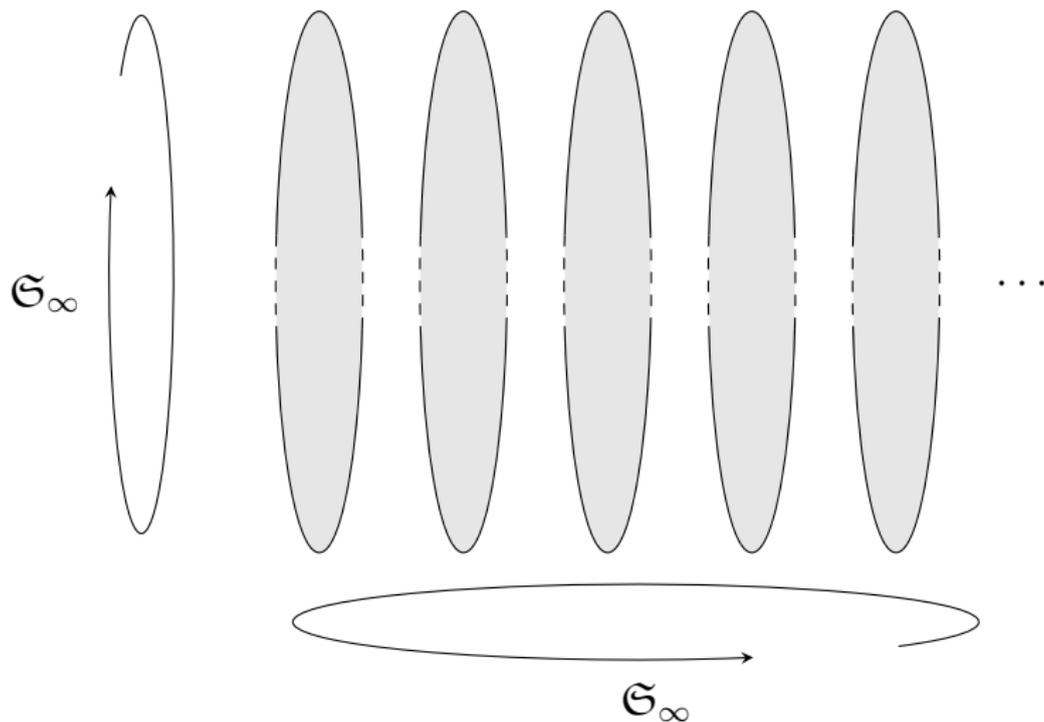

$$\varphi_G(n) = ?$$

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

$$\varphi_G(n) = ?$$

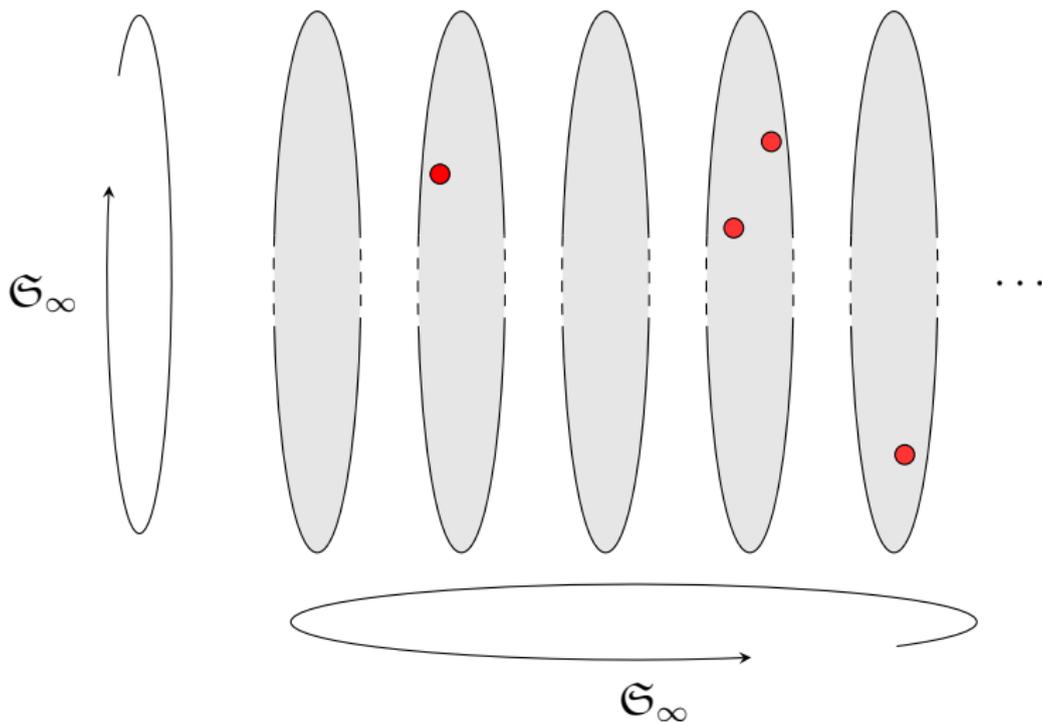

An orbit of degree $n \longleftrightarrow$ a partition of n

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

$$\varphi_G(n) = ?$$

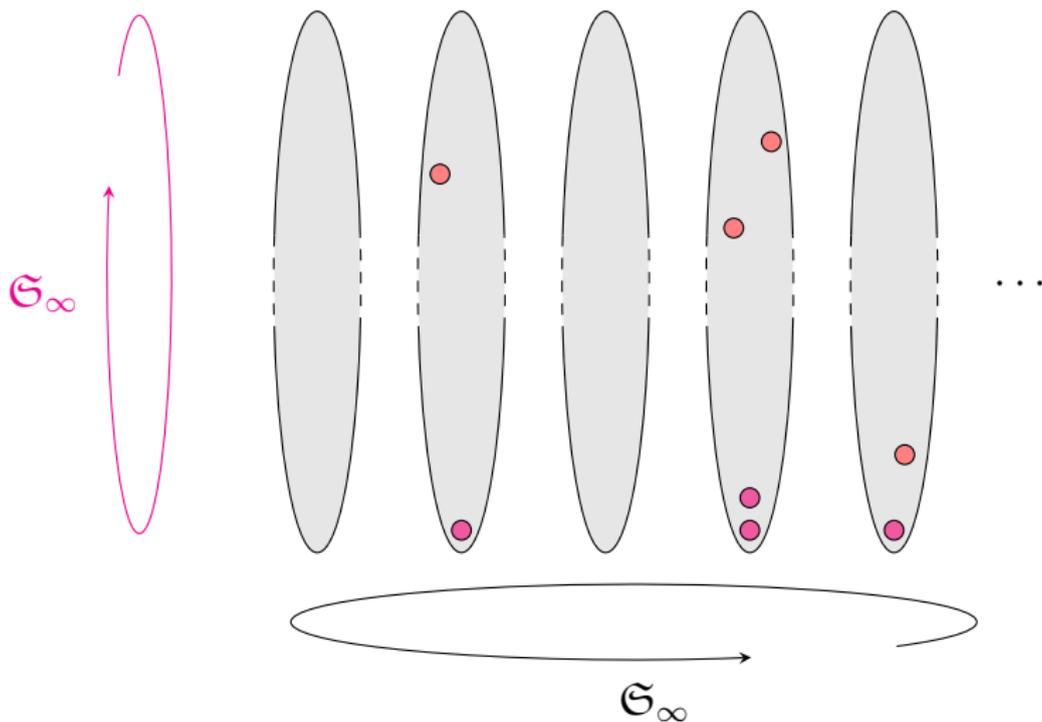

An orbit of degree $n \longleftrightarrow$ a partition of n

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

$$\varphi_G(n) = ?$$

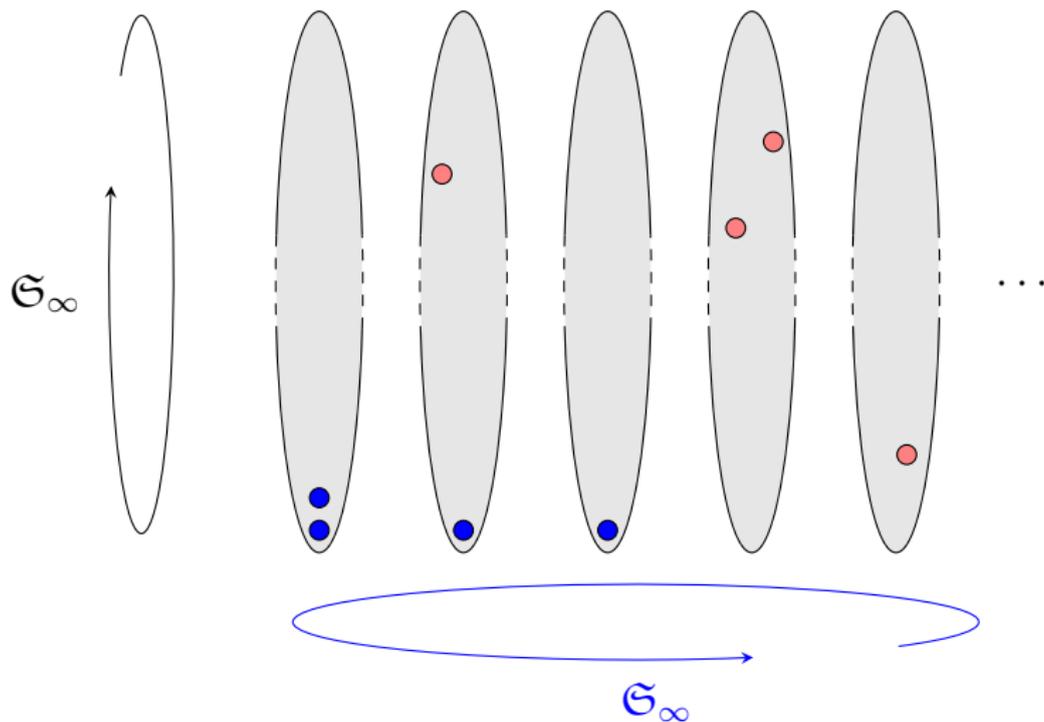

An orbit of degree $n \longleftrightarrow$ a partition of n

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

$\varphi_G(n) =$

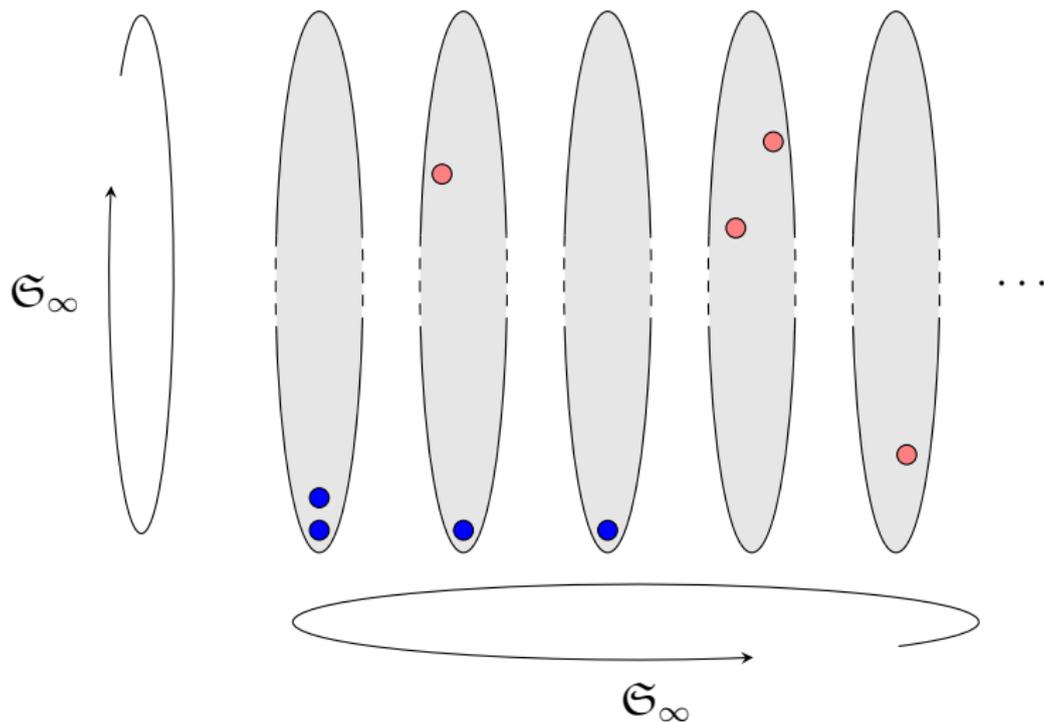

An orbit of degree $n \longleftrightarrow$ a partition of n

Example : $G = \mathfrak{S}_\infty \wr \mathfrak{S}_\infty$

$$\varphi_G(n) = p(n)$$

An orbit of degree $n \longleftrightarrow$ a partition of n

Examples of orbit algebras (1)

Example 1

If $G = \mathfrak{S}_\infty$, $\varphi_G(n) = 1$ for all n , and $\mathbb{Q}\mathcal{A}(G) = \mathbb{K}[x]$.

Examples of orbit algebras (1)

Example 1

If $G = \mathfrak{S}_\infty$, $\varphi_G(n) = 1$ for all n , and $\mathbb{Q}\mathcal{A}(G) = \mathbb{K}[x]$.

Example 2

$G = \mathfrak{S}_\infty \wr \mathfrak{S}_3$, recall that $\varphi_G(n) = p_3(n)$.

Examples of orbit algebras (1)

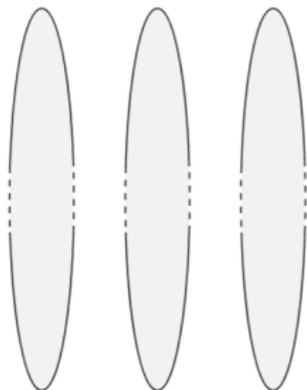

Example 1

If $G = \mathfrak{S}_\infty$, $\varphi_G(n) = 1$ for all n , and $\mathbb{Q}\mathcal{A}(G) = \mathbb{K}[x]$.

Example 2

$G = \mathfrak{S}_\infty \wr \mathfrak{S}_3$, recall that $\varphi_G(n) = p_3(n)$.

$A_n =$ homogeneous symmetric polynomials of degree n in x_1, x_2, x_3

Examples of orbit algebras (1)

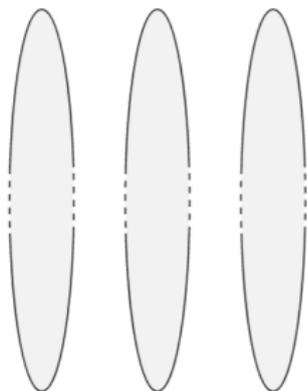

Example 1

If $G = \mathfrak{S}_\infty$, $\varphi_G(n) = 1$ for all n , and $\mathbb{Q}\mathcal{A}(G) = \mathbb{K}[x]$.

Example 2

$G = \mathfrak{S}_\infty \wr \mathfrak{S}_3$, recall that $\varphi_G(n) = p_3(n)$.

$A_n =$ homogeneous symmetric polynomials of degree n in x_1, x_2, x_3

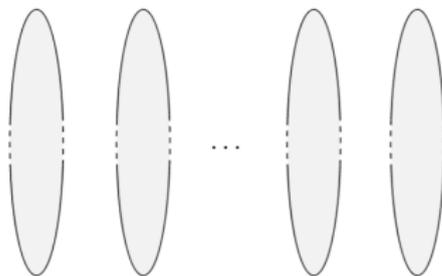

$$\rightarrow \mathbb{Q}\mathcal{A}(\mathfrak{S}_\infty \wr \mathfrak{S}_3) = \mathbb{K}[x_1, x_2, x_3]^{\mathfrak{S}_3}$$

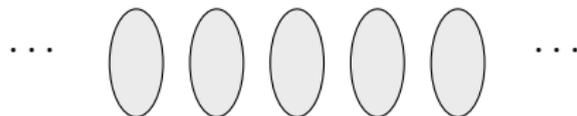

Examples of orbit algebras (2)

More generally, for H subgroup of \mathfrak{S}_m :

- $G = \mathfrak{S}_\infty \wr H$:
 $\mathbb{Q}\mathcal{A}(G) = \mathbb{K}[x_1, \dots, x_m]^H$, the algebra of invariants of H
 $\mathbb{Q}\mathcal{A}(G)$ is finitely generated by Hilbert's theorem.

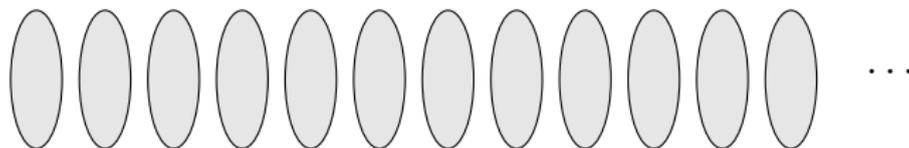

- $G = H \wr \mathfrak{S}_\infty$:
 $\mathbb{Q}\mathcal{A}(G)$ = the free algebra generated by the age of H

The tower has shape $H_0, H, H, H \dots$

Lemma to prove

G has tower $H_0 H_1 H_2 H_3 \Rightarrow H_1 = H_2$

Proof.

An element $s \in G$ stabilizing the blocks \leftrightarrow a quadruple

$g \in H_1 \rightarrow \exists (1, g, h, k), h, k \in H_1.$

Let σ be an element of G that permutes "straightforwardly" the first two blocks and fixes the other two.

Conjugation of x by σ in $G \rightarrow y = (g, 1, h, k)$

Then: $x^{-1}y = (g, g^{-1}, 1, 1)$

By arguing that the tower does not depend on the ordering of the blocks, g^{-1} and therefore g are in H_2 .

In the infinite case, apply to each restriction to four consecutive blocks of the fixator of the previous ones in G .
