Goulnara Arzhantseva Martin Finn-Sell goulnara.arzhantseva@univie.ac.at martin.finn-sell@univie.ac.at

We begin by recalling a few notions from linear algebra. Let V and W be k-vector spaces.

- The set Hom(V, W) of all linear maps from V to W is a vector space with pointwise operations;
- The tensor product V ⊗ W is the universal vector space for bilinear maps: that is V ⊗ W is the quotient of the free vector space on the set V × W under the equivalence relation generated by:

$$(v_1, w) + (v_2, w) = (v_1 + v_2, w)$$
  
 $(v, w_1) + (v, w_2) = (v, w_1 + w_2)$   
 $\lambda(v, w) = (\lambda v, w) = (v, \lambda w).$ 

We denote elements of  $V \otimes W$  by  $v \otimes w$ , moreover if  $\{e_i\}_i$  and  $\{f_j\}_j$  are bases for V and W respectively,  $\{e_i \otimes f_j\}_{i,j}$  is a basis for  $V \otimes W$ . Finally, as an example, one should show that  $\mathbb{C}^n \otimes \mathbb{C}^m \cong \mathbb{C}^{nm}$  as finite dimensional vector spaces.

• Let  $\{e_i\}_{i=1}^{\dim(V)}$  be a basis of V. The dual space to V, denoted V<sup>\*</sup>, is the vector space of all linear functions  $V \to k$  with pointwise operations, which is spanned by the linear extensions of the functions  $f_i(e_i) = 1$ . If V has an inner product, and  $\{e_i\}_i$  is orthonormal with respect to that inner product, then V<sup>\*</sup> also has an inner product such that  $\{f_i\}$  are orthonormal. If V is finite dimensional, then  $V \cong V^*$ , but otherwise not.

**Question 1.** Let V and W be finite dimensional k-vector spaces for some field k. Show that  $Hom(V, W) \cong V^* \otimes W$  is an isomorphism of vector spaces, where  $V^*$  denotes the dual vector space of V.

**Question 2.** Let G be a finite group, X be a finite set on which G acts,  $\rho$  denote the corresponding permutation representation and  $\chi$  the corresponding character. For every  $g \in G$  show that  $\chi(g)$  is the number of elements of X fixed by g.

**Question 3.** Let V be a finite dimensional vector space with a representation  $\rho : G \to GL(V)$  and let V<sup>\*</sup> be the vector space dual of V. Let  $\langle \nu, \phi \rangle = \phi(\nu)$  be the natural pairing between the dual space V<sup>\*</sup> and V.

1. Show that there is a unique representation  $\rho^* : G \to GL(V^*)$  satisfying:

$$\langle \rho(\nu), \rho^*(s)(\phi) \rangle = \langle \nu, \phi \rangle;$$

2. By fixing a basis for V and using the dual basis for V<sup>\*</sup>, show that  $\rho^*(g) = \rho(g^{-1})^T$ .

**Question 4.** Let p be a prime number. Show that any p-group G has a faithful irreducible representation if and only if the centre Z(G) is cyclic.

**Question 5.** Let G be a finite group.

a) Show that for any irreducible representation  $\rho$  of G with character  $\chi$ , the set

$$\ker(\chi) := \{g \in G \mid \chi(g) = \chi(1)\}$$

is a normal subgroup of G;

b) Show that each normal subgroup  $N \triangleleft G$  is the intersection of subgroups of the form ker( $\chi$ ), where  $\chi$  is the character of an irreducible representation.

**Question 6.** Let  $\rho_1 : G \to GL(V_1)$  and  $\rho_2 : G \to GL(V_2)$  be two representations with characters  $\chi_1$  and  $\chi_2$  respectively, and let  $W := Hom(V_1, V_2)$ . For every  $g \in G$  and  $f \in W$ , denote by  $\rho(g)f$  the element of W given by:

$$\rho(g)f = \rho_2(g) \circ f \circ \rho_1^{-1}(g).$$

- a) Show that  $\rho : G \to GL(W)$  is a representation of G;
- b) Show that the character of  $\rho$  is  $\chi_1^*\chi_2$ , where  $\chi_1^*$  denotes the character of the dual representation of  $\rho_1$  defined in Question 3;
- c) Show that  $\rho$  is isomorphic as a representation to the representation  $\rho_1^* \otimes \rho_2$ .

(Note that here, we are considering the tensor product representation of G, not  $G \times G$ . This is obtained by composing with the map:  $G \to G \times G$ , and using the tensor product of the representations  $\rho_i$ ; this has formula:  $\rho_1^* \otimes \rho_2(g) = \rho_1^*(g) \otimes \rho_2(g)$  in this case).
