Technical Report
July 2013

Contents

1 Introduction

The COCONUT environment is a modular solver environment for nonlinear continuous global optimization problems with an open-source kernel, which can be expanded by commercial and open-source solver components (inference modules).

The application programmer's interface (API) is designed to make the development of the various module types independent of each other and independent of the internal model representation. It is be a collection of open-source C++ classes protected by the LGPL and GPL license models, so that most of it could be used as part of commercial software (special license regulations are contained in the distribution). It uses the `FILIB++` library for interval computations and the Vienna matrix template library (`VMTL`) for the internal representation of various matrix classes. The graphs are implemented using the `VGTL` (Vienna Graph Template Library), and the search database is based on the `VDBL` (Vienna DataBase Library). - Support for dynamic linking relieves the user from recompilation when modules are added or removed. In addition, it is designed for distributed computing, and will probably be developed further (in the upcoming years) to support parallel computing as well.

1.1 Search Graph

The solution algorithm is an advanced branch-and-bound scheme which proceeds by working on the **search graph**, a **directed acyclic graph** (DAG) of search nodes, each representing an optimization problem, a **model**. The **search nodes** come in two flavors: **full nodes** which record the complete description of a model, and **delta nodes** which only contain the difference between the model represented by the node and its (then only) parent.

1.2 Models, Expressions

The optimization problems (models) stored in the **work nodes**, which are passed to the various inference engines, are kept as directed acyclic graphs (DAG), as well. This representation has big advantages. - Hereby, a complete optimization problem is always represented by a single DAG. The vertices of the graph represent operators similar to computational trees. Constants and variables are sources, objective and constraints are sinks of the DAG.

Every vertex represents a real valued function of n variables. Predefined functions include sum, product, max, min, elementary real functions (exp, log, pow, sqrt, ...), and also some discrete operators like `all_diff` and count.

1.3 Evaluators

For expression graphs (DAG or tree), special **forward** and **backward evaluators** are provided. Currently implemented are real function values, function ranges, gradients (real, interval), and slopes. In the near future evaluators for Hessians (real, interval) and second order slopes will be provided, as well.

1.4 Module Interfaces

The strategy calls the various model classes to perform clearly distinguished tasks. The **management modules** and the **initializers** change the internal structure, the **report modules** produce output, and the **inference modules** (**inference engines**, **graph analyzers**) calculate information about the models and the search graph.

2 Bug List

Member coco::coco::full_node::get_database () const

This method needs to be replaced, once the COCONUT environment really gets distributed.

Member coco::coco::full_node::get_database_ptr () const

This method needs to be replaced, once the COCONUT environment really gets distributed.

Member coco::coco::model::simplify_thin ()

The simplify_thin method does not yet work properly.

Member coco::coco::work_node::get (unsigned int __type)

The get function is not yet properly implemented.

Member coco::full_node::get_database () const

This method needs to be replaced, once the COCONUT environment really gets distributed.

Member coco::full_node::get_database_ptr () const

This method needs to be replaced, once the COCONUT environment really gets distributed.

Member coco::model::simplify_thin ()

The simplify_thin method does not yet work properly.

Member coco::work_node::get (unsigned int __type)

The get function is not yet properly implemented.

3 Module Index

3.1 Modules

Here is a list of all modules:

4 Namespace Index

4.1 Namespace List

Here is a list of all namespaces with brief descriptions:

5 Class Index

5.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

6 Class Index

6.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

7 File Index

7.1 File List

Here is a list of all files with brief descriptions:

8 Module Documentation

8.1 Classes and types for basic data management

Classes

- class coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class coco::control_data

  The class for communicating parameter information to COCONUT modules.
- class coco::datamap

  The base class for communicating with COCONUT modules.
- class coco::info_contents

  The class for returning additional information from inference modules.
- struct coco::interval_st

Constructor-free interval.

- class coco::interval

  Interval wrapper class.
- class coco::termination_reason

  This class holds the reason of termination of inference and management modules.
- class gptr

  Global pointer class.
- class ptr

  Local global pointer class.
- class counted_ptr

Defines

- #define BASIC_ALLTYPE_CHECK 1
- #define BASIC_ALLTYPE_ASSERT(A)
- #define BASIC_ALLTYPE_ASSERT2(A, B)
- #define BASIC_ALLTYPE_FIX_EMPTY_VECTOR(CT, T)

Typedefs

- typedef basic_alltype coco::additional_info_u

  type definition for backwards compatibility with earlier API versions

Functions

- void coco::set_translation_map (const std::map< std::string, std::string > &tr_msg_map)

  A datamap function for setting the message translation map.
- const std::string & coco::get_translated_message (const std::string &msg)

  A datamap function for message translation.

8.1.1 Detailed Description

The classes and types in this section are the basics for the internal data management of the COCONUT environment.

8.1.2 Define Documentation

8.1.2.1 #define BASIC_ALLTYPE_ASSERT(*A*)

Value:

```
do { \
      if(__cont_type != (A)) \
        throw api_exception(apiee_internal,\
          std::string("api/basic_alltype.h/1: Basic alltype ")+type_cstr((A))+\
                      " requested, type was "+type_name());\
    } while(0)
```

Compare the requested type with the stored type and throw an exception if they do not coincide.

Definition at line 124 of file search_graph.cc.

8.1.2.2 #define BASIC_ALLTYPE_ASSERT2(*A, B*)

Value:

```
do { \
      if(__cont_type != (A) && __cont_type != (B)) \
        throw api_exception(apiee_internal,\
          std::string("api/basic_alltype.h/2: Basic alltype ")+type_cstr((A))+\
                      " requested, type was "+type_name());\
    } while(0)
```

Compare the requested type with the stored type and a fallback type and throw an exception if it does not coincide with either.

Definition at line 135 of file search_graph.cc.

8.1.2.3 #define BASIC_ALLTYPE_CHECK 1

If BASIC_ALLTYPE_CHECK is non-null, the exact contents of the basic_alltype are checked, and an exception is thrown if a different type is requested than is contained.

Definition at line 50 of file search_graph.cc.

8.1.2.4 #define BASIC_ALLTYPE_FIX_EMPTY_VECTOR(*CT, T*)

Value:

```
do { \
      if (__cont_type != (CT) && is_empty_vector()) \
        /* The const_cast is ugly, but there's no other option. */ \
        const_cast<basic_alltype *>(this)->operator=(std::vector<T>()); \
    } while(0)
```

Convert any size 0 vector to any other. This is needed because [] in Python is untyped.

Definition at line 154 of file search_graph.cc.

8.1.3 Typedef Documentation

8.1.3.1 typedef basic_alltype coco::additional_info_u

This is a definition to keep backwards compatibility with earlier versions of the API (before 2.35).

Definition at line 43 of file addinfo.h.

8.1.4 Function Documentation

8.1.4.1 const std::string & coco::get_translated_message (const std::string & *msg*)

This map can be used during the registration phase for producing highly descriptive termr messages or translations.

Definition at line 64 of file termreason.cc.

8.1.4.2 void coco::set_translation_map (const std::map< std::string, std::string > & *tr_msg_map*)

This function is used to set a new message translation map.

Definition at line 53 of file termreason.cc.

8.2 Basic API utilities

Classes

- class coco::api_exception

  API exception class.
- class coco::nyi_exception

  Not Yet Implemented exception class.
- class coco::graph_analyzer_exception

  Graph analyzer exception class.
- class coco::inference_engine_exception

  Inference engine exception class.
- class coco::initializer_exception

  Initializer exception class.
- class coco::management_module_exception

  Management module exception class.
- class coco::report_module_exception

  Report module exception class.

Defines

- #define PURE_VIRTUAL { throw "Pure virtual function called!"; }

Enumerations

- enum coco::api_exception_type { coco::apiee_internal = 1, coco::apiee_evaluator = 2, coco::apiee_io = 3, coco::apiee_delta = 4, coco::apiee_search_graph = 5, coco::apiee_communication_data = 6, coco::apiee_inference_engine = 7, coco::apiee_graph_analyzer = 8, coco::apiee_management_module = 9, coco::apiee_initializer = 10, coco::apiee_report_module = 11, coco::apiee_oom = 12, coco::apiee_nyi = 13, coco::apiee_other = 14 }

  Enum for classifying api_exceptions.
- enum coco::coco::api_exception_type { coco::coco::apiee_internal = 1, coco::coco::apiee_evaluator = 2, coco::coco::apiee_io = 3, coco::coco::apiee_delta = 4, coco::coco::apiee_search_graph = 5, coco::coco::apiee_communication_data = 6, coco::coco::apiee_inference_engine = 7, coco::coco::apiee_graph_analyzer = 8, coco::coco::apiee_management_module = 9, coco::coco::apiee_initializer = 10, coco::coco::apiee_report_module = 11, coco::coco::apiee_oom = 12, coco::coco::apiee_nyi = 13, coco::coco::apiee_other = 14, coco::coco::apiee_internal = 1, coco::coco::apiee_evaluator = 2, coco::coco::apiee_io = 3, coco::coco::apiee_delta = 4, coco::coco::apiee_search_graph = 5, coco::coco::apiee_communication_data = 6, coco::coco::apiee_inference_engine = 7, coco::coco::apiee_graph_analyzer = 8, coco::coco::apiee_management_module = 9, coco::coco::apiee_initializer = 10, coco::coco::apiee_report_module = 11, coco::coco::apiee_oom = 12, coco::coco::apiee_nyi = 13, coco::coco::apiee_other = 14, coco::coco::apiee_internal = 1, coco::coco::apiee_evaluator = 2, coco::coco::apiee_io = 3, coco::coco::apiee_delta = 4, coco::coco::apiee_search_graph = 5, coco::coco::apiee_communication_data = 6, coco::coco::apiee_inference_engine = 7, coco::coco::apiee_graph_analyzer = 8, coco::coco::apiee_management_module = 9, coco::coco::apiee_initializer = 10, coco::coco::apiee_report_module = 11, coco::coco::apiee_oom = 12, coco::coco::apiee_nyi = 13, coco::coco::apiee_other = 14, coco::coco::apiee_internal = 1, coco::coco::apiee_evaluator = 2, coco::coco::apiee_io = 3, coco::coco::apiee_delta = 4, coco::coco::apiee_search_graph = 5, coco::coco::apiee_communication_data = 6, coco::coco::apiee_inference_engine = 7, coco::coco::apiee_graph_analyzer = 8, coco::coco::apiee_management_module = 9, coco::coco::apiee_initializer =

Enum for classifying api_exceptions.

Functions

- template<class _TH >
  std::string coco::coco::convert_to_str (const _TH &_h)

  Convert an object of any printable class to a string.
- template<typename _TK , typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const map< _TK, _Ve, _TC, _TA > &a)
- template<typename _TK , typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const multimap< _TK, _Ve, _TC, _TA > &a)
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const vector< _Ve, _TA > &a)
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const list< _Ve, _TA > &a)
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const deque< _Ve, _TA > &a)
- template<typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const set< _Ve, _TC, _TA > &a)
- template<typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const multiset< _Ve, _TC, _TA > &a)
- template<typename _TA , typename _TB >
  ostream & std::operator<< (ostream &o, const pair< _TA, _TB > &a)
- template<typename _TA , typename _TB , typename _TC >
  ostream & std::operator<< (ostream &o, const triple< _TA, _TB, _TC > &a)

8.2.1 Detailed Description

The classes and functions in this section are basic utilities used throughout the COCONUT environment, like conversion routines and exception classes.

8.2.2 Define Documentation

8.2.2.1 #define PURE_VIRTUAL { throw "Pure virtual function called!"; }

This macro is used to circumvent certain bugs connected with pure virtual methods in GNU C++ prior version 3.

Definition at line 37 of file coconut_config.h.

8.2.3 Enumeration Type Documentation

8.2.3.1 enum coco::api_exception_type

This enum contains type values for the different api_exceptions.

Enumerator:

apiee_internal internal stuff
apiee_evaluator evaluator related
apiee_io I/O error
apiee_delta delta related
apiee_search_graph search graph related
apiee_communication_data communication data related
apiee_inference_engine for inference engines

8.2.4 Function Documentation

8.2.4.1 template<class _TH > std::string coco::coco::convert_to_str (const _TH & *_h*) [inline]

This function converts an object _h of class _TH into a std::string, if it is printable.

Definition at line 46 of file expression.h.

8.2.4.2 template<typename _TA , typename _TB > ostream& std::operator<< (ostream & *o,* const pair< _TA, _TB > & *a*)

This function defines the stream output operator for pairs.

Definition at line 40 of file print_tuple.h.

8.2.4.3 template<typename _Ve , typename _TC , typename _TA > ostream& std::operator<< (ostream & *o,* const set< _Ve, _TC, _TA > & *a*)

This function defines the stream output operator for standard sets.

Definition at line 40 of file print_set.h.

8.2.4.4 template<typename _TK , typename _Ve , typename _TC , typename _TA > ostream& std::operator<< (ostream & *o,* const map< _TK, _Ve, _TC, _TA > & *a*)

This function defines the stream output operator for standard maps.

Definition at line 42 of file print_map.h.

8.2.4.5 template<typename _Ve , typename _TA > ostream& std::operator<< (ostream & *o,* const vector< _Ve, _TA > & *a*)

This function defines the stream output operator for standard vectors.

Definition at line 42 of file print_seq.h.

8.2.4.6 template<typename _TA , typename _TB , typename _TC > ostream& std::operator<< (ostream & *o,* const triple< _TA, _TB, _TC > & *a*)

This function defines the stream output operator for triples.

Definition at line 48 of file print_tuple.h.

8.2.4.7 template<typename _Ve , typename _TC , typename _TA > ostream& std::operator<< (ostream & *o,* const multiset< _Ve, _TC, _TA > & *a*)

This function defines the stream output operator for standard multisets.

Definition at line 56 of file print_set.h.

8.2.4.8 template<typename _TK , typename _Ve , typename _TC , typename _TA > ostream& std::operator<< (ostream & *o,* const multimap< _TK, _Ve, _TC, _TA > & *a*)

This function defines the stream output operator for standard multimaps.

Definition at line 58 of file print_map.h.

8.2.4.9 template<typename _Ve , typename _TA > ostream& std::operator<< (ostream & *o,* const list< _Ve, _TA > & *a*)

This function defines the stream output operator for standard lists.

Definition at line 58 of file print_seq.h.

8.2.4.10 template<typename _Ve , typename _TA > ostream& std::operator<< (ostream & *o,* const deque< _Ve, _TA > & *a*)

This function defines the stream output operator for standard double ended queues.

Definition at line 75 of file print_seq.h.

8.3 Models

Classes

- class coco::annotation

  Annotations for Models.
- class coco::expression_node

  The base class for a node in the expression DAGs.
- class coco::expression_print_visitor
- class coco::graphorder_visitor

  This visitor class is used for computing a graph order.
- class coco::model

  The model class (an attributed DAG of expression nodes, lowest class in the model hierarchy)
- class coco::model_iddata

  The model id-data class (the topmost in the model class hierarchy)
- class coco::model_gid

  Model Group Data Class (middle class in the model hierarchy)

Typedefs

- typedef model::walker coco::expression_walker

  Walker to the expression DAG.
- typedef model::const_walker coco::expression_const_walker

  Const walker to the expression DAG.
- typedef model::walker coco::coco::expression_walker

  Walker to the expression DAG.
- typedef model::const_walker coco::coco::expression_const_walker

  Const walker to the expression DAG.

Functions

- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order)

  Compute a graph order.
- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order, std::vector< unsigned int > &inv_order)

  Compute a graph order.

Variables

- const char * coco::expr_names [ ]

Operator types of standard expressions

These definitions define the standard operator types for the expression_node class. In the operator descriptions y_i is used for the value of the ith child of the node, while $x_i = c_i y_i$ stands for the value of the ith child of the node multiplied by the ith entry of the `coeffs` array.

8.3.1 Detailed Description

The classes in this section define the internal representation of models (optimization problems) in the COCONUT environment.

8.3.2 Define Documentation

8.3.2.1 #define EXPRINFO_ABS -14

The absolute value node is $|x_0 + q|$, where q is stored in `params.nd()`.

Definition at line 144 of file search_graph.cc.

8.3.2.2 #define EXPRINFO_ALLDIFF -48

This node returns 1 if all children are pairwise different. Here different means $|x_i - x_j| > \delta$ with δ in `params.nd()`.

Definition at line 314 of file search_graph.cc.

8.3.2.3 #define EXPRINFO_AND -43

The value is 1 if all $x_i \in \boldsymbol{x}_i$ where the $\boldsymbol{x}_i$ are stored in `params.i()`, and 0 otherwise.

Definition at line 291 of file search_graph.cc.

8.3.2.4 #define EXPRINFO_ARG -34

This node returns the argument of a complex number.

Definition at line 241 of file search_graph.cc.

8.3.2.5 #define EXPRINFO_ASQR -62

This is a virtual expression needed for the `dag_delta` class. Ghost nodes are exceptions to the rule that node numbers have to be unique throughout all models in a model group. The node number of a ghost node is the same as the node number of the node, of which it is a ghost.

Definition at line 379 of file search_graph.cc.

8.3.2.6 #define EXPRINFO_ATAN2 -26

The atan2 node has no parameters, and its definition is $\mathrm{atan2}(x_0, x_1) = \mathrm{atan}(x_0/x_1)$.

Definition at line 197 of file search_graph.cc.

8.3.2.7 #define EXPRINFO_BLACKBOX -64

This is a virtual expression needed for the `dag_delta` class. Ghost nodes are exceptions to the rule that node numbers have to be unique throughout all models in a model group. The node number of a ghost node is the same as the node number of the node, of which it is a ghost.

Definition at line 383 of file search_graph.cc.

8.3.2.8 #define EXPRINFO_CGFEM -61

This node computes information relevant for FEM computations with constant A.

Definition at line 377 of file search_graph.cc.

8.3.2.9 #define EXPRINFO_CMPROD -60

This node computes a matrix vector product with constant A.

Definition at line 373 of file search_graph.cc.

8.3.2.10 #define EXPRINFO_COND -56

This node computes the condition of a matrix.

Definition at line 359 of file search_graph.cc.

8.3.2.11 #define EXPRINFO_CONSTANT -1

This node represents a constant, whose value is contained in `params.nd()`.

Definition at line 80 of file search_graph.cc.

8.3.2.12 #define EXPRINFO_COS -19

The cosine node is $\cos(x_0 + q)$, where q is stored in `params.nd()`.

Definition at line 164 of file search_graph.cc.

8.3.2.13 #define EXPRINFO_COSH -21

The cosine node is $\cosh(x_0 + q)$, where q is stored in `params.nd()`.

Definition at line 172 of file search_graph.cc.

8.3.2.14 #define EXPRINFO_COUNT -47

The count node returns for how many i we have $x_i \in \boldsymbol{x}_i$, where $*$ the intervals $\boldsymbol{x}_i$ are stored in `params.i()`.

Definition at line 309 of file search_graph.cc.

8.3.2.15 #define EXPRINFO_CPLXCONJ -35

This node returns the complex conjugate of a complex number.

Definition at line 246 of file search_graph.cc.

8.3.2.16 #define EXPRINFO_D1FUNC -63

This is a virtual expression needed for the `dag_delta` class. Ghost nodes are exceptions to the rule that node numbers have to be unique throughout all models in a model group. The node number of a ghost node is the same as the node number of the node, of which it is a ghost.

Definition at line 381 of file search_graph.cc.

8.3.2.17 #define EXPRINFO_DET -55

This node computes the determinant of a matrix.

Definition at line 356 of file search_graph.cc.

8.3.2.18 #define EXPRINFO_DIV -25

The general division node is $a * y_0/y_1$ and a is stored in `params.nd()`.

Definition at line 192 of file search_graph.cc.

8.3.2.19 #define EXPRINFO_EXP -16

The exponential node is e^{x_0+q}, where q is stored in `params.nd()`.

Definition at line 152 of file search_graph.cc.

8.3.2.20 #define EXPRINFO_EXPECTATION -53

This node computes the expectation value of a function depending on stochastic nodes.

Definition at line 344 of file search_graph.cc.

8.3.2.21 #define EXPRINFO_FEM -59

This node computes information relevant for FEM computations.

Definition at line 368 of file search_graph.cc.

8.3.2.22 #define EXPRINFO_GAUSS -22

The gaussian function node is $e^{-(x_0-q_0)^2/q_1^2}$, where the two dimensional vector q is stored in `params.d()`.

Definition at line 177 of file search_graph.cc.

8.3.2.23 #define EXPRINFO_GHOST 0

This is a virtual expression needed for the `dag_delta` class. Ghost nodes are exceptions to the rule that node numbers have to be unique throughout all models in a model group. The node number of a ghost node is the same as the node number of the node, of which it is a ghost.

Definition at line 75 of file search_graph.cc.

8.3.2.24 #define EXPRINFO_HISTOGRAM -49

The histogram node counts how many children x_i are in which interval $\boldsymbol{x}_{2k}$. The numbers n_k are collected, and if for all k the value $n_k \in \boldsymbol{x}_{2k+1}$, the result is 1. Otherwise, it is 0.

Definition at line 320 of file search_graph.cc.

8.3.2.25 #define EXPRINFO_IF -42

We get the interval $\boldsymbol{x}$ from `params.ni()` and define the result n of the node as $n = \begin{cases} x_1 & \text{if } x_0 \in \boldsymbol{x} \\ x_2 & \text{otherwise.} \end{cases}$

Definition at line 287 of file search_graph.cc.

8.3.2.26 #define EXPRINFO_IM -33

This node returns the imaginary part of a complex number.

Definition at line 238 of file search_graph.cc.

8.3.2.27 #define EXPRINFO_IMPLIES -46

The value is 1 if the following is true: $x_0 \in \boldsymbol{x}_0 \implies x_1 \in \boldsymbol{x}_1$, where the $\boldsymbol{x}_i$ are stored in `params.i()`. Otherwise, the value is 0.

Definition at line 305 of file search_graph.cc.

8.3.2.28 #define EXPRINFO_IN -41

The point defined by $x = (x_i)$ is tested against the box $\boldsymbol{x}$ stored in `params.i()`. If $x \in \text{int}(\boldsymbol{x})$ the value is 1, if $x \in \partial\boldsymbol{x}$, the return value is 0, and if $x \notin \boldsymbol{x}$ the node's value is -1.

Definition at line 276 of file search_graph.cc.

8.3.2.29 #define EXPRINFO_INTEGRAL -54

This node computes the definite integral of a function depending on free nodes over the box stored in `params.i()`.

Definition at line 348 of file search_graph.cc.

8.3.2.30 #define EXPRINFO_INTPOWER -15

The integer power node is x_0^n, where the integer n is in `params.nn()`.

Definition at line 148 of file search_graph.cc.

8.3.2.31 #define EXPRINFO_INVERT -11

Inversion is defined as a/y_0 with a in `params.nd()`.

Definition at line 132 of file search_graph.cc.

8.3.2.32 #define EXPRINFO_IQUAD -29

This node is a quadratic form in **all variables**. The `params.m()` stores the enhanced matrix $(A|b)$ for the function $x^T Ax + b^T x$. A is assumed symmetric and sparse.

Definition at line 217 of file search_graph.cc.

8.3.2.33 #define EXPRINFO_LEVEL -50

The matrix A in `params.mi()` contains a set of boxes $A_{i:}$ contained within another. The result is the smallest row index j such that the vector $x = (x_i)$ is contained in $A_{j:}$.

Definition at line 326 of file search_graph.cc.

8.3.2.34 #define EXPRINFO_LIN -27

This node is a linear combination of **all variables**. In `params.nn()` the row number in the matrix of linear constraints is stored.

Definition at line 204 of file search_graph.cc.

8.3.2.35 #define EXPRINFO_LINSQR -31

This node is a quadratic form in **all variables**. The `params.m()` stores the enhanced matrix $(A|b)$ for the function $x^T Ax + b^T x$. A is assumed symmetric and sparse.

Definition at line 230 of file search_graph.cc.

8.3.2.36 #define EXPRINFO_LOG -17

The logarithm node is $\log(x_0 + q)$, where q is stored in `params.nd()`.

Definition at line 156 of file search_graph.cc.

8.3.2.37 #define EXPRINFO_LOOKUP -36

This node computes a function with a table lookup procedure. The table is stored in `params.m()`.

Definition at line 252 of file search_graph.cc.

8.3.2.38 #define EXPRINFO_MAX -6

The maximum node is defined as $\max(c, x_i \quad i = 0, \ldots, n)$ with c in `params.nd()`.

Definition at line 108 of file search_graph.cc.

8.3.2.39 #define EXPRINFO_MEAN -4

This is a sum node where it is guaranteed that all coefficients are positive, and their sum is \$1\$. So this is a convex linear combination without constant term: $\sum_{i=0}^{n} x_i$.

Definition at line 100 of file search_graph.cc.

8.3.2.40 #define EXPRINFO_MIN -7

The minimum node is defined as $\min(c, x_i \quad i = 0, \ldots, n)$ with c in `params.nd()`.

Definition at line 112 of file search_graph.cc.

8.3.2.41 #define EXPRINFO_MONOME -8

The general monomial node is defined as $\prod_{i=0}^{n-1} x_i^{n_i}$, where the n_i are contained in the vector `params.n()`.

Definition at line 117 of file search_graph.cc.

8.3.2.42 #define EXPRINFO_MPROD -58

This node computes a matrix-vector product.

Definition at line 365 of file search_graph.cc.

8.3.2.43 #define EXPRINFO_NEIGHBOR -51

This returns 1 if x_0 and x_1 are neighbors, i.e., if (x_0, x_1) is in the list of allowed value pairs (v_{2k}, v_{2k+1}) where the vector v is stored in `params.n()`. The x_i and v_i are integers.

Definition at line 334 of file search_graph.cc.

8.3.2.44 #define EXPRINFO_NOGOOD -52

This returns 1 if $x = v$ with v in `params.n()`. Both $x = (x_i)$ and v are integer vectors.

Definition at line 338 of file search_graph.cc.

8.3.2.45 #define EXPRINFO_NORM -10

The norm node has the form $\|x\|_k$, where k is stored in `params.nd()`, and x is the vector built from the values of all children.

Definition at line 126 of file search_graph.cc.

8.3.2.46 #define EXPRINFO_NOT -45

The value is 0 if $x_0 \in \boldsymbol{x}$ and 1 otherwise. Here $\boldsymbol{x}$ is in `params.ni()`.

Definition at line 299 of file search_graph.cc.

8.3.2.47 #define EXPRINFO_NUMOFPREDEF -(EXPRINFO_UNDEFINED)

This is the number of standard operator types.

Definition at line 392 of file search_graph.cc.

8.3.2.48 #define EXPRINFO_OR -44

The value is 0 if all $x_i \notin \boldsymbol{x}_i$ where the $\boldsymbol{x}_i$ are stored in `params.i()`, and 1 otherwise.

Definition at line 295 of file search_graph.cc.

8.3.2.49 #define EXPRINFO_POLY -23

The polynomial node is $\sum_{i=0}^{n} \alpha_i x_0^i$, where the coefficients α_i are stored in `params.d()`.

Definition at line 182 of file search_graph.cc.

8.3.2.50 #define EXPRINFO_POW -24

The general power node is $(x_0 + p)^{x_1}$ with p in `params.nd()`.

Definition at line 188 of file search_graph.cc.

8.3.2.51 #define EXPRINFO_PROD -5

The product node has the form $c \prod_{i=0}^{n} y_i$, where c is in `params.nd()`.

Definition at line 104 of file search_graph.cc.

8.3.2.52 #define EXPRINFO_PSD -57

This node checks whether a matrix is positive semidefinite.

Definition at line 362 of file search_graph.cc.

8.3.2.53 #define EXPRINFO_PWCONSTLC -39

This node computes a piecewise constant left-continuous function from a table. The table is stored in `params.m()`.

Definition at line 264 of file search_graph.cc.

8.3.2.54 #define EXPRINFO_PWCONSTRC -40

This node computes a piecewise constant right-continuous function from a table. The table is stored in `params.m()`.

Definition at line 268 of file search_graph.cc.

8.3.2.55 #define EXPRINFO_PWLIN -37

This node computes a piecewise linear function from a table. The table is stored in `params.m()`.

Definition at line 256 of file search_graph.cc.

8.3.2.56 #define EXPRINFO_QUAD -28

This node is a quadratic form in **all variables**. The `params.m()` stores the enhanced matrix $(A|b)$ for the function $x^T Ax + b^T x$. A is assumed symmetric and sparse.

Definition at line 210 of file search_graph.cc.

8.3.2.57 #define EXPRINFO_RE -32

This node returns the real part of a complex number.

Definition at line 235 of file search_graph.cc.

8.3.2.58 #define EXPRINFO_SCPROD -9

The scalar product is defined as $\sum_{i=0}^{k-1} x_{2i}x_{2i+1}$ without parameters.

Definition at line 121 of file search_graph.cc.

8.3.2.59 #define EXPRINFO_SIN -18

The sine node is $\sin(x_0 + q)$, where q is stored in `params.nd()`.

Definition at line 160 of file search_graph.cc.

8.3.2.60 #define EXPRINFO_SINH -20

The sine node is $\sinh(x_0 + q)$, where q is stored in `params.nd()`.

Definition at line 168 of file search_graph.cc.

8.3.2.61 #define EXPRINFO_SPLINE -38

This node computes a cubic spline from a table. The table is stored in `params.m()`.

Definition at line 260 of file search_graph.cc.

8.3.2.62 #define EXPRINFO_SQROOT -13

The square root node is $\sqrt{x_0 + q}$, where q is stored in `params.nd()`.

Definition at line 140 of file search_graph.cc.

8.3.2.63 #define EXPRINFO_SQUARE -12

The square node is $(x_0 + q)^2$ where q is stored in `params.nd()`.

Definition at line 136 of file search_graph.cc.

8.3.2.64 #define EXPRINFO_SUM -3

This is a general linear combination of the form $\sum_{i=1}^{n} x_i + c$ where c is stored in `params.nd()`. Here x_i as in all operator types stands for $k_i y_i$, where y_i is the result of the ith child and k_i stands for `coeff[i]`.

Definition at line 95 of file search_graph.cc.

8.3.2.65 #define EXPRINFO_UNDEFINED -65

This is the artifical number for undefined nodes.

Definition at line 389 of file search_graph.cc.

8.3.2.66 #define EXPRINFO_VARIABLE -2

The variable number of this node is contained in `params.nn()`.

Definition at line 83 of file search_graph.cc.

8.3.2.67 #define EXPRINFO_WSUMSQR -30

This node is a quadratic form in **all variables**. The `params.m()` stores the enhanced matrix $(A|b)$ for the function $x^T Ax + b^T x$. A is assumed symmetric and sparse.

Definition at line 223 of file search_graph.cc.

8.3.3 Typedef Documentation

8.3.3.1 typedef model::const_walker coco::expression_const_walker

This type defines a const walker (generalized const pointer) to the expression DAG.

Definition at line 1235 of file model.h.

8.3.3.2 typedef model::const_walker coco::coco::expression_const_walker

This type defines a const walker (generalized const pointer) to the expression DAG.

Definition at line 1235 of file search_graph.cc.

8.3.3.3 typedef model::walker coco::coco::expression_walker

This type defines a walker (generalized pointer) to the expression DAG.

Definition at line 1230 of file search_graph.cc.

8.3.3.4 typedef model::walker coco::expression_walker

This type defines a walker (generalized pointer) to the expression DAG.

Definition at line 1230 of file model.h.

8.3.4 Function Documentation

8.3.4.1 void coco::graphorder (const model & *DAG,* std::vector< unsigned int > & *order*)

This function computes a node order in `order`, which is compatible with the DAG structure defined by `DAG`.

Definition at line 132 of file graphorder.cc.

8.3.4.2 void coco::graphorder (const model & *DAG,* std::vector< unsigned int > & *order,* std::vector< unsigned int > & *inv_order*)

This function computes a node order in `order`, which is compatible with the DAG structure defined by `DAG`, and an inverse order map.

Definition at line 137 of file graphorder.cc.

8.3.5 Variable Documentation

8.3.5.1 const char * coco::expr_names

This array of strings keeps the names of the various operator types in the .dag format.

Definition at line 37 of file expression.cc.

8.4 Search Graph

Classes

- class coco::work_node_comp_hook

  The work_node_comp_hook class (work node computation hook)
- class coco::diameter_comp_hook

  The log-volume computation hook (work node computation hook)
- class coco::inference_engine_comp_hook

  The inference engine meta computation hook (work node computation hook)
- class coco::logvol_comp_hook

  The log-volume computation hook (work node computation hook)
- class coco::memory_comp_hook

  The memory computation hook (work node computation hook)
- class coco::objbounds_comp_hook

  The objective-bounds computation hook (work node computation hook)
- class coco::pending_status_comp_hook

  The pending status computation hook (work node computation hook)
- class coco::pfstar_hook

  The pfstar computation hook (work node computation hook)
- class coco::coco::search_node

  Base type of the nodes in the search graph.
- class coco::coco::delta_node

  Class holding the delta nodes in the search graph.
- class coco::coco::full_node

  Class holding the full nodes in the search graph.
- class coco::coco::work_node

  Work node, which is passed to the inference engines.
- class coco::coco::work_node::constraint_iterator_base

  The base class for work_node::constraint_iterator and work_node::constraint_const_iterator.
- class coco::sum_deltas

  Pre-post visitor for summing up all the deltas during work node extraction.
- class coco::search_graph

  The search graph.
- class coco::vol_comp_hook

  The volume computation hook (work node computation hook)

Typedefs

- typedef uint32_t coco::search_node_id

  Type of the unique search node identifier.
- typedef uint32_t coco::coco::search_node_id

  Type of the unique search node identifier.
- typedef search_graph::const_walker coco::search_inspector

  The search inspector for graph analysis.
- typedef search_graph::walker coco::search_focus

  The search focus for work node selection.

Enumerations

- enum coco::coco::search_node_relation { coco::coco::snr_root, coco::coco::snr_reduction, coco::coco::snr_relaxation, coco::coco::snr_split, coco::coco::snr_glue, coco::coco::snr_worknode, coco::coco::snr_virtual }

  Enum specifying node relations in the search graph.
- enum coco::search_node_relation { coco::snr_root, coco::snr_reduction, coco::snr_relaxation, coco::snr_split, coco::snr_glue, coco::snr_worknode, coco::snr_virtual }

  Enum specifying node relations in the search graph.

Functions

- work_node coco::full_node_to_work_node (full_node &n_full, gptr< search_node > &ground)

  This function converts a full_node to a work_node.
- work_node full_node_to_work_node (full_node &n_full, gptr< search_node > &ground)

  This function converts a full_node to a work_node.

8.4.1 Detailed Description

The classes and types in this section are used to build the search graph structure used during the solution process.

8.4.2 Typedef Documentation

8.4.2.1 typedef search_graph::walker coco::search_focus

There are only few variables of the search_focus type which are used to select nodes in the search graph for analysis.

Definition at line 343 of file search_graph.h.

8.4.2.2 typedef search_graph::const_walker coco::search_inspector

Variables of the search_inspector type are used to analyze the search graph.

Definition at line 336 of file search_graph.h.

8.4.2.3 typedef uint32_t coco::coco::search_node_id

This is the type of the unique identifier generated for a work node inside a search graph.

Definition at line 44 of file coconut_types.h.

8.4.2.4 typedef uint32_t coco::coco::search_node_id

This is the type of the unique identifier generated for a work node inside a search graph.

Definition at line 45 of file search_graph.cc.

8.4.3 Enumeration Type Documentation

8.4.3.1 enum coco::coco::search_node_relation

This enum is used to specify the relation of a node to its parent(s) in the search graph.

Enumerator:

snr_root this is the root node of a search graph
snr_reduction this is a reduction of the parent node
snr_relaxation this is a relaxation of the parent node
snr_split this is one of a number of splits of the parent
snr_glue this is a glueing of a number of parent nodes
snr_worknode this is a **standalone** work-node
snr_virtual this is a virtual node of the search graph

Definition at line 62 of file search_graph.cc.

8.4.3.2 enum coco::search_node_relation

This enum is used to specify the relation of a node to its parent(s) in the search graph.

Enumerator:

snr_root this is the root node of a search graph
snr_reduction this is a reduction of the parent node
snr_relaxation this is a relaxation of the parent node
snr_split this is one of a number of splits of the parent
snr_glue this is a glueing of a number of parent nodes
snr_worknode this is a **standalone** work-node
snr_virtual this is a virtual node of the search graph

Definition at line 62 of file search_node.h.

8.4.4 Function Documentation

8.4.4.1 work_node coco::full_node_to_work_node (full_node & *n_full*, gptr< search_node > & *ground*) [inline]

This function converts the full_node `n_full` to a work_node. The parameter `ground` provides a reference to the ground of the search graph.

Definition at line 40 of file search_graph.cc.

8.4.4.2 work_node full_node_to_work_node (full_node & *n_full*, gptr< search_node > & *ground*) [inline]

This function converts the full_node `n_full` to a work_node. The parameter `ground` provides a reference to the ground of the search graph.

Definition at line 40 of file sum_deltas.h.

8.5 Deltas

Classes

- class coco::annotation_delta

  the delta class for annotation changes
- class coco::no_certificate

  The not-certified certificate.
- class coco::split_certificate

  The certificate for deltas formed by splits.
- class coco::compound_certificate

  The certificate for deltas formed by compressing bound_delta entries.
- class coco::rigorous_module_certificate

  The certificate for deltas computed by rigorous inference engines.
- class coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::certificate_base

  Base class for the certificates.
- class coco::delta_get_action

  Stored procedure class for computing the delta action specifier.
- class coco::delta

  The delta class (updates to work nodes)
- class coco::delta_base

  Base class for the deltas.
- class coco::undelta

  The undelta class (undo of updates to work nodes)
- class coco::undelta_base

  Base class for the undeltas.
- class coco::bound_undelta

  The bound undelta class for undoing changes to the node bounds in a model.
- class coco::bound_delta

  The bound delta class for changing the node bounds within a model.
- class coco::boxes_delta

  A delta class which adds new boxes to the search database.
- class coco::dag_undelta

  The DAG undelta class for undoing changes to the DAG of a model.
- class coco::dag_delta

  The DAG delta class for performing changes to the DAG of a model.
- class coco::infeasible_undelta

  The infeasible undelta class for undoing changes to the feasibility of a model.
- class coco::infeasible_delta

  The infeasible delta class for marking a model as infeasible.
- class coco::point_delta

  A delta class which adds new points to the search database.
- class coco::semantics_undelta

  The semantics undelta class for undoing changes to the node semantics in a model.
- class coco::semantics_delta

The semantics delta class for changing the node semantics within a model.

- class coco::split_undelta

  The split undelta class for removing proposed splits from a work_node.
- class coco::split_delta

  The split delta class for proposing useful splits.
- class coco::table_delta

  The base class for all deltas adding information to the search database.

Typedefs

- typedef vdbl::rowid coco::delta_id

  The class for delta ids.
- typedef vdbl::rowid coco::coco::delta_id

  The class for delta ids.

Functions

- std::ostream & coco::operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.
- std::ostream & coco::operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.
- std::ostream & coco::coco::operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.
- std::ostream & coco::coco::operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.

8.5.1 Detailed Description

The classes and types in this section define the deltas used for updating the internal representation of the models.

8.5.2 Typedef Documentation

8.5.2.1 typedef vdbl::rowid coco::coco::delta_id

The delta_id type is essentially a vdbl::rowid pointing to a row in the `deltas` table of the search database.

Definition at line 46 of file api_deltabase.h.

8.5.2.2 typedef vdbl::rowid coco::coco::delta_id

The delta_id type is essentially a vdbl::rowid pointing to a row in the `deltas` table of the search database.

Definition at line 46 of file search_graph.cc.

8.5.3 Function Documentation

8.5.3.1 std::ostream& coco::operator<< (std::ostream & *o,* const certificate & *t*) [inline]

Stream output operator for certificates, which calls the get_contents method of the certificate.

Definition at line 112 of file api_certbase.h.

8.5.3.2 std::ostream & coco::coco::operator<< (std::ostream & *o,* const certificate & *t*) [inline]

Stream output operator for certificates, which calls the get_contents method of the certificate.

Definition at line 112 of file search_graph.cc.

8.5.3.3 std::ostream & coco::coco::operator<< (std::ostream & *o,* const delta & *t*) [inline]

Stream output operator for deltas, which calls the get_action method of the delta.

Definition at line 137 of file search_graph.cc.

8.5.3.4 std::ostream& coco::operator<< (std::ostream & *o,* const delta & *t*) [inline]

Stream output operator for deltas, which calls the get_action method of the delta.

Definition at line 137 of file api_deltabase.h.

8.6 Evaluators

Classes

- class coco::bbfunc

  The bbfunc class (black box function)
- class coco::bbfunc_expr

  The bbfunc_expr class (black box function expression)
- class coco::d1func

  The d1func class (one dimensional function)
- class coco::d1func_expr

  The d1func_expr class (one dimensional function expression)
- class coco::dag_d1func

  The dag_d1func class (one dimensional function)
- struct coco::dd1f_interval_eval_type

  Visitor data for dd1f_interval_eval.
- class coco::dd1f_interval_eval

  Forward function range evaluation.
- struct coco::polsppt_ret_type

  Return type for polsppt_eval.
- struct coco::polsppt_eval_type

  Visitor data for polsppt_eval.
- class coco::polsppt_eval

  Forward function range evaluation.
- struct coco::defdom_ret_type

  Return type for defdom_eval.
- struct coco::defdom_eval_type

  Visitor data for defdom_eval.
- class coco::defdom_eval

  Forward function range evaluation.
- class coco::prep_d_eval

  Preparation Evaluator for derivatives.
- struct coco::func_d_eval_type

  Visitor data for func_d_eval.
- class coco::func_d_eval

  Forward function evaluation with preparation of derivative data.
- struct coco::der_eval_type

  Visitor data for der_eval.
- class coco::der_eval

  Backward gradient evaluation with prepared derivative data.
- class coco::variable_indicator

  Bitmap class used to indicate variable occurrence.
- class coco::_evaluator_base

  Base class of all evaluators.
- class coco::evaluator_base

  Base class of all (non-caching) evaluators.
- class coco::cached_evaluator_base

Base class of all caching evaluators.

- class coco::forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::backward_evaluator_base

  Base class of all (non-caching) backward evaluators.
- class coco::cached_forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::cached_backward_evaluator_base

  Base class of all caching backward evaluators.
- struct coco::func_eval_type

  Visitor data for func_eval.
- class coco::func_eval

  Forward function evaluation.
- class coco::hsf_func

  The hsf_func class (one dimensional function)
- class coco::prep_id_eval

  Preparation Evaluator for interval derivatives.
- struct coco::func_id_eval_type

  Visitor data for func_id_eval.
- class coco::func_id_eval

  Forward function range evaluation with preparation of interval derivative data.
- struct coco::ider_eval_type

  Visitor data for ider_eval.
- class coco::ider_eval

  Backward interval gradient evaluation with prepared interval derivative data.
- struct coco::iderf_ret_type

  Visitor data for iderf_eval return value.
- struct coco::iderf_eval_type

  Visitor data for iderf_eval.
- class coco::iderf_eval

  Forward function and derivative range evaluation.
- struct coco::interval_eval_type

  Visitor data for interval_eval.
- class coco::interval_eval

  Forward function range evaluation.
- struct coco::Islope_eval_type

  Visitor data for Islope_eval.
- class coco::Islope_eval

  Forward function range evaluation.
- struct coco::func_islp_return_type

  The return type of the func_islp_eval evaluator.
- class coco::prep_islp_eval

  Preparation Evaluator for first order slopes.
- struct coco::func_islp_eval_type

  Visitor data for func_id_eval.
- class coco::func_islp_eval

Forward function range evaluation with preparation of first order slope data.

- struct coco::islp_eval_type_INTERNAL

  Visitor data for islp_eval.
- class coco::islp_eval_INTERNAL

  Backward first order slope evaluation with prepared first order slope data.
- struct coco::xxxNumber_eval_type

  Visitor data for xxxNumber_eval.
- class coco::xxxNumber_eval

  Forward function range evaluation.
- class coco::xexp_func

  The xexp_func class (one dimensional function)

Enumerations

- enum coco::d1func_monotonicity_t { coco::d1fpmon_dec = -1, coco::d1fpmon_const = 0, coco::d1fpmon_inc = 1, coco::d1fpmon_unclear = 2, coco::d1fpmon_nonmon = -2 }

  The d1func_monotonicity_t enum.

Functions

- d1func_monotonicity_t coco::operator- (d1func_monotonicity_t x)

  The d1func_monotonicity_t unary minus.
- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts.
- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::_recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts (internal)
- template<class _Visitor , class _Walker >
  _Visitor::return_value coco::evaluate (_Visitor __v, _Walker __start)

  Evaluate an evaluator on a DAG.

8.6.1 Detailed Description

The classes and types in this section define the evaluators which can be used for gaining varios information from the models like evaluation of function and constraints, automatic differentiation,...

8.6.2 Enumeration Type Documentation

8.6.2.1 enum coco::d1func_monotonicity_t

The d1func_monotonicity_t enum encodes monotonicity information for a one-dimensional function.

Enumerator:

d1fpmon_dec

8.6.3 Function Documentation

8.6.3.1 template<class _Walker , class _Visitor > _Visitor::return_value coco::coco::_recursive_short_cut_walk (_Walker __w, _Visitor __f)

This **internal** function performs a recursive pre+post order walk starting at `__w`. At every node various methods of the visitor `__f` are called:

`vinit` is called before walking for every virtual node

`vcollect` is called after a child of a virtual node has finished

`vvalue` is called to compute the return value of a virtual node

`preorder` is called before the children are visited. The return value of this method determines the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

`collect` is called everytime a child has finished. The return value of this method determines the further graph walk:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip the specified number of children.

`postorder` is called after all children have been visited

`value` is called to compute the return value for this node

`short_cut_to` is called to provide the target of the short cut if a short cut is signalled by `preorder`.

This function does not check for hitting the virtual ground node.

Definition at line 1079 of file evaluator.h.

8.6.3.2 template<class _Visitor , class _Walker > _Visitor::return_value coco::coco::evaluate (_Visitor __v, _Walker __start)

This function evaluates the evaluator `__v` on the graph, calculating the result for the node pointed at by `__start`.

Definition at line 1127 of file evaluator.h.

8.6.3.3 d1func_monotonicity_t coco::operator- (d1func_monotonicity_t *x*) [inline]

This operator inverts monotonicity for a one-dimensional function.

Definition at line 62 of file d1func.h.

8.6.3.4 template<class _Walker , class _Visitor > _Visitor::return_value coco::coco::recursive_short_cut_walk (_Walker *__w*, _Visitor *__f*)

Perform a recursive pre+post order walk starting at __w. At every node various methods of the visitor __f are called:

vinitis called before walking for every virtual node

vcollectis called after a child of a virtual node has finished

vvalueis called to compute the return value of a virtual node

preorderis called before the children are visited. The return value of this method determines the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

collectis called everytime a child has finished. The return value of this method determines the further graph walk:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip the specified number of children.

postorderis called after all children have been visited

valueis called to compute the return value for this node

short_cut_tois called to provide the target of the short cut if a short cut is signalled by preorder.

Definition at line 989 of file evaluator.h.

8.7 Module Base Classes

Classes

- class coco::graph_analyzer

  Graph analyzer base class.
- class coco::ie_return_type

  The return class of all inference engines.
- class coco::statistic_info

  Base class for all inference engine statistics classes.
- class coco::inference_module_cache_autogen

  Inference module cache auto-generate method base class.
- class coco::inference_module_cache

  Inference module cache class.
- class coco::inference_engine

  Inference engine base class.
- class coco::initializer

  Initializer base class.
- class coco::management_module

  Management module base class.
- class coco::report_module

  Report module base class.
- class coco::coco::semantics

  Expression Semantics.

Defines

- #define new_cb_ref() _new_cb_ref((void∗)this)

Typedefs

- typedef unsigned int cb_ref_handle
- typedef ie_return_type coco::ga_return_type

  Graph analyzer return type.

Functions

- cb_ref_handle _new_cb_ref (void ∗dest)
- int delete_cb_ref (cb_ref_handle ref)
- void ∗ cb_ref (cb_ref_handle ref)
- bool coco::operator== (const convex_e &__c, const convex_e &__d)

  Equality comparison operator.
- bool coco::operator== (const convex_e &__c, const convex_info &__d)
- bool coco::operator== (const convex_info &__c, const convex_e &__d)
- bool coco::operator!= (const convex_e &__c, const convex_e &__d)

  Disequality comparison operator.
- bool coco::operator!= (const convex_e &__c, const convex_info &__d)

- bool coco::operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & coco::operator<< (std::ostream &o, const convex_e &__s)

  C++ stream output operator for convex_e.
- bool coco::coco::operator== (const convex_e &__c, const convex_e &__d)

  Equality comparison operator.
- bool coco::coco::operator== (const convex_e &__c, const convex_info &__d)
- bool coco::coco::operator== (const convex_info &__c, const convex_e &__d)
- bool coco::coco::operator!= (const convex_e &__c, const convex_e &__d)

  Disequality comparison operator.
- bool coco::coco::operator!= (const convex_e &__c, const convex_info &__d)
- bool coco::coco::operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & coco::coco::operator<< (std::ostream &o, const convex_e &__s)

  C++ stream output operator for convex_e.
- std::ostream & coco::coco::operator<< (std::ostream &o, const semantics &__s)

  C++ stream output operator for semantics.
- std::ostream & coco::operator<< (std::ostream &o, const termination_reason &__x)

  C++ stream output operator for the termination_reason.

8.7.1 Detailed Description

The classes and types in this section define the base classes for the five COCONUT module types inference engines, graph analyzers, management modules, initializers, and report modules.

8.7.2 Define Documentation

8.7.2.1 #define new_cb_ref( ) _new_cb_ref((void*)this)

This function returns a new cb_ref_handle which points to the inference engine object which calls this macro.

Definition at line 42 of file callback_ref.h.

8.7.3 Typedef Documentation

8.7.3.1 typedef unsigned int cb_ref_handle

This is the type of the handles handed out for backreference from C or Fortran code to C++ objects in wrapper headers for inference engines in C or Fortran.

Definition at line 36 of file callback_ref.h.

8.7.3.2 typedef ie_return_type coco::ga_return_type

This is the type which is returned by the analyze method of any graph_analyzer.

Definition at line 74 of file graph_analyzer.h.

8.7.4 Function Documentation

8.7.4.1 cb_ref_handle _new_cb_ref (void * *dest*)

This function returns a new cb_ref_handle which points to the `dest` parameter provided. This function should not be called directly. Rather the new_cb_ref macro should be used, which inserts the `this` pointer of the inference engine object into the `dest` parameter.

Definition at line 46 of file callback_ref.cc.

8.7.4.2 void* cb_ref (cb_ref_handle *ref*)

This function returns the pointer to the inference engine object corresponding to the cb_ref_handle `ref`. The pointer is of type `void*` and has to be cast to the appropriate C++ type.

Definition at line 65 of file callback_ref.cc.

8.7.4.3 int delete_cb_ref (cb_ref_handle *ref*)

This function deletes the cb_ref_handle `ref`. It returns 0 on success and <0 on failure.

Definition at line 53 of file callback_ref.cc.

8.7.4.4 bool coco::operator!= (const convex_e & *__c*, const convex_e & *__d*) [inline]

Disequality comparison operator. Note that only the convex_info part counts!

Definition at line 195 of file convex_info.h.

8.7.4.5 bool coco::coco::operator!= (const convex_e & *__c*, const convex_e & *__d*) [inline]

Disequality comparison operator. Note that only the convex_info part counts!

Definition at line 195 of file search_graph.cc.

8.7.4.6 bool coco::operator!= (const convex_e & *__c*, const convex_info & *__d*) [inline]

Disequality comparison operator with a convex_info.

Definition at line 203 of file convex_info.h.

8.7.4.7 bool coco::coco::operator!= (const convex_e & *__c*, const convex_info & *__d*) [inline]

Disequality comparison operator with a convex_info.

Definition at line 203 of file search_graph.cc.

8.7.4.8 bool coco::coco::operator!= (const convex_info & *__c*, const convex_e & *__d*) [inline]

Disequality comparison operator with a convex_info.

Definition at line 211 of file search_graph.cc.

8.7.4.9 bool coco::operator!= (const convex_info & __c, const convex_e & __d) [inline]

Disequality comparison operator with a convex_info.

Definition at line 211 of file convex_info.h.

8.7.4.10 std::ostream& coco::operator<< (std::ostream & o, const termination_reason & __x) [inline]

This operator writes a termination_reason (the message) to an ostream.

Definition at line 90 of file termreason.h.

8.7.4.11 std::ostream& coco::coco::operator<< (std::ostream & o, const convex_e & __s) [inline]

This operator writes a convex_e in .dag format to an ostream.

Definition at line 219 of file search_graph.cc.

8.7.4.12 std::ostream& coco::operator<< (std::ostream & o, const convex_e & __s) [inline]

This operator writes a convex_e in .dag format to an ostream.

Definition at line 219 of file convex_info.h.

8.7.4.13 std::ostream & coco::coco::operator<< (std::ostream & o, const semantics & __s)

This operator writes a semantics expression in .dag format to an ostream.

Definition at line 224 of file semantics.cc.

8.7.4.14 bool coco::operator== (const convex_e & __c, const convex_e & __d) [inline]

Equality comparison operator. Note that only the convex_info part counts!

Definition at line 171 of file convex_info.h.

8.7.4.15 bool coco::coco::operator== (const convex_e & __c, const convex_e & __d) [inline]

Equality comparison operator. Note that only the convex_info part counts!

Definition at line 171 of file search_graph.cc.

8.7.4.16 bool coco::operator== (const convex_e & __c, const convex_info & __d) [inline]

Equality comparison operator with a convex_info.

Definition at line 179 of file convex_info.h.

8.7.4.17 bool coco::coco::operator== (const convex_e & __c, const convex_info & __d) [inline]

Equality comparison operator with a convex_info.

Definition at line 179 of file search_graph.cc.

8.7.4.18 bool coco::operator== (const convex_info & __c, const convex_e & __d) [inline]

Equality comparison operator with a convex_info.

Definition at line 187 of file convex_info.h.

8.7.4.19 bool coco::coco::operator== (const convex_info & __c, const convex_e & __d) [inline]

Equality comparison operator with a convex_info.

Definition at line 187 of file search_graph.cc.

8.8 Database Interface

Classes

- class coco::dbt_row

  This type is used to hold one row in some table of the search database.
- class coco::point_check_feasibility

  Stored procedure checking the feasibility of a point.
- class coco::box_check_intersection

  Stored procedure checking whether a box intersects the work_node's box.
- class coco::coco::work_node_context

  The evaluation context when retrieving from the search database.
- class coco::search_graph_context

  An evaluation context when retrieving from the search database.

Functions

- vdbl::tableid coco::get_point_table (vdbl::database *ptr, vdbl::standard_table *&ptb, vdbl::userid)

  Get the point from the search database.

8.8.1 Detailed Description

The classes and types in this section provide the interface to the VDBL (Vienna DataBase Library).

8.8.2 Function Documentation

8.8.2.1 vdbl::tableid coco::get_point_table (vdbl::database * *ptr*, vdbl::standard_table *& *ptb*, vdbl::userid)

This function returns the tableid of and gets a pointer `ptb` to the "point" table of the search database `ptr`. If the point table does not yet exist, it is created. The point table has the following column structure: name type default sem x vector<double> N/A the coordinates L_mult vector<double> empty the multipliers f double +COCO_INF the objective value kappa double 1. the Kar.-John mult. best bool false best point in box verified bool false verified point feasible bool stored proc. feasible point optimal bool false local optimum global bool false from global box relaxation bool false from a relaxation class unsigned int 0 point class

8.9 Advanced Utilities

Classes

- struct coco::coconut_random_f
- class coco::wnc_hook_base

  Base class for the work node computation hooks.
- class coco::sparsity_visitor

  Preorder visitor which calculates sparsity structures.
- class coco::sparsity3_visitor

  Preorder visitor which calculates sparsity structures.

Defines

- #define coconut_random random
- #define coconut_seed(A) srandom(A)
- #define COCONUT_RAND_MAX RAND_MAX
- #define COCONUT_RRAND_MIN -1.e08
- #define COCONUT_RRAND_MAX +1.e08
- #define coconut_init_random() coconut_seed(INIT_SEED)
- #define COCONUT_RRAND_MIN_BETA 0.01
- #define COCONUT_RRAND_MIN_ALPHA 0.5
- #define COCONUT_RRAND_MAX_ALPHA 0.99

Typedefs

- typedef long int coco::rand_t
- typedef std::pair< unsigned int, unsigned int > coco::ipair

  Row-column index pair.
- typedef std::set< ipair > coco::splist

  Sparsity information.
- typedef std::triple< unsigned int, unsigned int, unsigned int > coco::itriple

  Row-column-depth index triple.
- typedef std::set< itriple > coco::stlist

  Sparsity information.

Functions

- double coco::d_random ()
- double coco::r_random (double l, double u, double beta=10.0, double alpha=0.9)
- double coco::r_random (const interval &_i, double beta=10.0, double alpha=0.9)
- interval coco::i_random (double l, double r, double beta=10.0, double alpha=0.9)
- interval coco::i_random (const interval &_i, double beta=10.0, double alpha=0.9)
- interval coco::i_random ()

  Sparsity calculation (Jacobian)

8.9.1 Detailed Description

The classes, types, and functions in this section provide additional utilities, which can be used to support the solution process.

8.9.2 Define Documentation

8.9.2.1 #define coconut_init_random( ) coconut_seed(INIT_SEED)

This function initializes the random number generator

Definition at line 85 of file coconut_random.h.

8.9.2.2 #define COCONUT_RAND_MAX RAND_MAX

This constant is the maximum number returned by coconut_random.

Definition at line 63 of file coconut_random.h.

8.9.2.3 #define coconut_random random

The function coconut_random returns a random integer number between 0 and COCONUT_RAND_MAX.

Definition at line 48 of file coconut_random.h.

8.9.2.4 #define COCONUT_RRAND_MAX +1.e08

This constant defines the maximal `double` number returned by r_random.

Definition at line 74 of file coconut_random.h.

8.9.2.5 #define COCONUT_RRAND_MAX_ALPHA 0.99

This constant defines the largest allowed value of the parameter `alpha` in r_random.

Definition at line 120 of file coconut_random.h.

8.9.2.6 #define COCONUT_RRAND_MIN -1.e08

This constant defines the minimal `double` number returned by r_random.

Definition at line 69 of file coconut_random.h.

8.9.2.7 #define COCONUT_RRAND_MIN_ALPHA 0.5

This constant defines the smallest allowed value of the parameter `alpha` in r_random.

Definition at line 115 of file coconut_random.h.

8.9.2.8 #define COCONUT_RRAND_MIN_BETA 0.01

This constant defines the smallest allowed value of the parameter `beta` in r_random.

Definition at line 110 of file coconut_random.h.

8.9.2.9 #define coconut_seed(*A*) srandom(A)

The function coconut_seed sets its `unsigned int` argument as the seed for a new sequence of pseudo-random numbers returned by coconut_random.

Definition at line 58 of file coconut_random.h.

8.9.3 Typedef Documentation

8.9.3.1 typedef std::pair<unsigned int, unsigned int> coco::ipair

This type holds a row-column index pair for a sparse matrix.

Definition at line 48 of file sparsity.cc.

8.9.3.2 typedef std::triple<unsigned int, unsigned int, unsigned int> coco::itriple

This type holds a row-column-depth index triple for a sparse 3-tensor.

Definition at line 48 of file sparsity3.cc.

8.9.3.3 typedef long int coco::rand_t

This is the type returned by the coconut_random function.

Definition at line 90 of file coconut_random.h.

8.9.3.4 typedef std::set<ipair> coco::splist

This type holds a list of row-column index pairs for a sparse matrix, the matrix' sparsity structure.

Definition at line 54 of file sparsity.cc.

8.9.3.5 typedef std::set<itriple> coco::stlist

This type holds a list of row-column-depth index triples for a sparse 3-tensor, the tensor's sparsity structure.

Definition at line 54 of file sparsity3.cc.

8.9.4 Function Documentation

8.9.4.1 double coco::d_random ( ) [inline]

The function d_random returns a random `double` number in [0,1[.

Definition at line 95 of file coconut_random.h.

8.9.4.2 void coco::get_leaves_vector (const search_graph & *__sgraph*, std::vector< si_ri_pair > & *v*, search_inspector * *sfoc*)

Definition at line 43 of file search_graph_funcs.cc.

8.9.4.3 interval coco::i_random (double *l*, double *r*, double *beta* = `10.0`, double *alpha* = `0.9`) [inline]

The function i_random returns a random `interval` subset of [l,r]. The role of the parameters `beta` and `alpha` is the same as in the workhorse function r_random(double,double,double,double).

Definition at line 219 of file coconut_random.h.

8.9.4.4 interval coco::i_random (const interval & *_i*, double *beta* = `10.0`, double *alpha* = `0.9`) [inline]

The function i_random returns a random `interval` subset of `_i`. The role of the parameters `beta` and `alpha` is the same as in the workhorse function r_random(double,double,double,double).

Definition at line 231 of file coconut_random.h.

8.9.4.5 interval coco::i_random ( ) [inline]

The function i_random returns a random `interval` subset of [0,1].

Definition at line 240 of file coconut_random.h.

8.9.4.6 double coco::r_random (double *l*, double *u*, double *beta* = `10.0`, double *alpha* = `0.9`) [inline]

The function r_random returns a random `double` number in the interval {[l,r]}. Actually, there are never numbers generated, which are outside the interval [COCONUT_RRAND_MIN,COCONUT_RRAND_MAX]. The numbers are generated along the graph of the function h(t) = (-alpha∗beta + t) / ((1/alpha-2)∗beta + t), if t > beta, = alpha∗t/beta, if t [-beta,beta], = (alpha∗beta + t) / ((1/alpha-2)∗beta - t), if t < -beta, where alpha is a positive parameter close to, but smaller than 1 (COCONUT_RRAND_MIN_ALPHA <= alpha <= COCONUT_RRAND_MAX_ALPHA < 1), and beta is a positive parameter (beta >= COCONUT_RRAND_MIN_BETA > 0). h is a smooth probability distribution function in [0,inf], and behaves similarly in [-inf,0] because of h(-t)=-h(t). The parameter `beta` specifies that in the interval [-beta,beta] the point is chosen from uniform distribution. Outside this interval, h(t)->1 from below when t->inf, and h(t)->-1

from above when t->-inf. The parameter `alpha` specifies how fast |h(t)|-1 decays while |t|->inf. Also, since h(beta) = alpha, alpha specifies that if a random point is generated in [-inf,inf] (or [0,inf] or [-inf,0], resp.), then it falls in [-beta,beta] with probability alpha .

Definition at line 168 of file coconut_random.h.

8.9.4.7 double coco::r_random (const interval & *_i*, double *beta* = `10.0`, double *alpha* = `0.9`) [inline]

The function r_random returns a random `double` number in the interval `_i`. Actually, there are never numbers generated, which are outside the interval [COCONUT_RRAND_MIN,COCONUT_RRAND_-MAX]. The role of the parameters `beta` and `alpha` is the same as in the workhorse function r_-random(double,double,double,double).

Definition at line 208 of file coconut_random.h.

8.9.4.8 void coco::sparsity (const model & *DAG*, unsigned int & *nnz_H*, unsigned int *& *H_ridx*, unsigned int *& *H_cidx*, bool *org_only*, bool *H_upper_only*, sp_indexing *indexing*, bool *var_one_based*)

This function computes the sparsity structure of the Hessian of the Lagrangean. Its parameters are:

- DAG: The expression DAG (input),
- nnz_H: The number of nonzero entries in the Hessian (output),
- H_ridx: The row index vector of the Hessian of the Lagrangean (output, the array is allocated using `new` by the function),
- H_cidx: The column index vector of the Hessianof the Lagrangean (output, the array is allocated using `new` by the function),
- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- H_upper_only: This bool specifies whether of the (symmetric!) Hessian only the row-column pairs above the diagonal shall be given (input),
- indexing: This enum specifies the requested indexing structure (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.9 void coco::sparsity (const model & *DAG*, std::vector< unsigned int > & *H_ridx*, std::vector< unsigned int > & *H_cidx*, std::vector< unsigned int > & *J_funidx*, std::vector< unsigned int > & *J_varidx*, bool *J_with_obj*, bool *J_obj_is_first*, bool *org_only*, bool *H_upper_only*, sp_indexing *indexing*, bool *fun_one_based*, bool *var_one_based*)

This function computes the sparsity structures of the Hessian of the Lagrangean and the Jacobian of the constraints. Its parameters are:

- DAG: The expression DAG (input),
- H_ridx: The row index vector of the Hessian of the Lagrangean (output),
- H_cidx: The column index vector of the Hessianof the Lagrangean (output),

- J_funidx: The function index vector of the Jacobian of the constraints (output),
- J_varidx: The variable index vector of the Jacobian of the constraints (output),
- J_with_obj: This bool determines whether the objective function is included in the Jacobian (input),
- J_obj_is_first: This bool determines whether the objective function is has the first function index (rather than the last) (input),
- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- H_upper_only: This bool specifies whether of the (symmetric!) Hessian only the row-column pairs above the diagonal shall be given (input),
- indexing: This enum specifies the requested indexing structure (input),
- fun_one_based: This boolean determines whether the function index in the Jacobian starts with 1 or with 0 (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.19 void coco::sparsity3 (const model & *DAG,* int & *nnz_H,* int *& *H_ridx,* int *& *H_cidx,* int & *nnz_J,* int *& *J_funidx,* int *& *J_varidx,* bool *J_with_obj,* bool *J_obj_is_first,* bool *org_only,* bool *H_upper_only,* sp_indexing *indexing,* bool *fun_one_based,* bool *var_one_based*)

This function computes the sparsity3 structures of the Hessian of the Lagrangean and the Jacobian of the constraints. Its parameters are:

- DAG: The expression DAG (input),
- nnz_H: The number of nonzero entries in the Hessian (output),
- H_ridx: The row index vector of the Hessian of the Lagrangean (output, the array is allocated using `new` by the function),
- H_cidx: The column index vector of the Hessianof the Lagrangean (output, the array is allocated using `new` by the function),
- nnz_J: The number of nonzero entries in the Jacobian (output),
- J_funidx: The function index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),
- J_varidx: The variable index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),
- J_with_obj: This bool determines whether the objective function is included in the Jacobian (input),
- J_obj_is_first: This bool determines whether the objective function is has the first function index (rather than the last) (input),

- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- H_upper_only: This bool specifies whether of the (symmetric!) Hessian only the row-column pairs above the diagonal shall be given (input),
- indexing: This enum specifies the requested indexing structure (input),
- fun_one_based: This boolean determines whether the function index in the Jacobian starts with 1 or with 0 (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.20 void coco::sparsity3 (const model & *DAG,* unsigned int & *nnz_H,* unsigned int *** & *H_ridx,* unsigned int *** & *H_cidx,* bool *org_only,* bool *H_upper_only,* sp_indexing *indexing,* bool *var_one_based*)

This function computes the sparsity3 structure of the Hessian of the Lagrangean. Its parameters are:

- DAG: The expression DAG (input),
- nnz_H: The number of nonzero entries in the Hessian (output),
- H_ridx: The row index vector of the Hessian of the Lagrangean (output, the array is allocated using `new` by the function),
- H_cidx: The column index vector of the Hessianof the Lagrangean (output, the array is allocated using `new` by the function),
- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- H_upper_only: This bool specifies whether of the (symmetric!) Hessian only the row-column pairs above the diagonal shall be given (input),
- indexing: This enum specifies the requested indexing structure (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.21 void coco::sparsity3 (const model & *DAG,* int & *nnz_H,* int *** & *H_ridx,* int *** & *H_cidx,* bool *org_only,* bool *H_upper_only,* sp_indexing *indexing,* bool *var_one_based*)

This function computes the sparsity3 structure of the Hessian of the Lagrangean. Its parameters are:

- DAG: The expression DAG (input),
- nnz_H: The number of nonzero entries in the Hessian (output),
- H_ridx: The row index vector of the Hessian of the Lagrangean (output, the array is allocated using `new` by the function),
- H_cidx: The column index vector of the Hessianof the Lagrangean (output, the array is allocated using `new` by the function),

- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- H_upper_only: This bool specifies whether of the (symmetric!) Hessian only the row-column pairs above the diagonal shall be given (input),
- indexing: This enum specifies the requested indexing structure (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.22 void coco::sparsity3 (const model & *DAG,* unsigned int & *nnz_J,* unsigned int *& *J_funidx,* unsigned int *& *J_varidx,* bool *J_with_obj,* bool *J_obj_is_first,* bool *org_only,* sp_indexing *indexing,* bool *fun_one_based,* bool *var_one_based*)

This function computes the sparsity3 structures of the Jacobian of the constraints. Its parameters are:

- DAG: The expression DAG (input),
- nnz_J: The number of nonzero entries in the Jacobian (output),
- J_funidx: The function index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),
- J_varidx: The variable index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),
- J_with_obj: This bool determines whether the objective function is included in the Jacobian (input),
- J_obj_is_first: This bool determines whether the objective function is has the first function index (rather than the last) (input),
- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- indexing: This enum specifies the requested indexing structure (input),
- fun_one_based: This boolean determines whether the function index in the Jacobian starts with 1 or with 0 (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

8.9.4.23 void coco::sparsity3 (const model & *DAG,* int & *nnz_J,* int *& *J_funidx,* int *& *J_varidx,* bool *J_with_obj,* bool *J_obj_is_first,* bool *org_only,* sp_indexing *indexing,* bool *fun_one_based,* bool *var_one_based*)

This function computes the sparsity3 structures of the Jacobian of the constraints. Its parameters are:

- DAG: The expression DAG (input),
- nnz_J: The number of nonzero entries in the Jacobian (output),
- J_funidx: The function index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),

- J_varidx: The variable index vector of the Jacobian of the constraints (output, the array is allocated using `new` by the function),
- J_with_obj: This bool determines whether the objective function is included in the Jacobian (input),
- J_obj_is_first: This bool determines whether the objective function is has the first function index (rather than the last) (input),
- org_only: This bool determines whether constraints and variables from the (symbolic!) KJ-conditions are left out (input),
- indexing: This enum specifies the requested indexing structure (input),
- fun_one_based: This boolean determines whether the function index in the Jacobian starts with 1 or with 0 (input),
- var_one_based: This boolean determines whether all indices depending on variables start with 1 or with 0 (input).

9 Namespace Documentation

9.1 coco Namespace Reference

the main namespace of the COCONUT API

Namespaces

- namespace coco
- namespace num

Classes

- struct analyticd_eval_type
- class analyticd_eval
- class annotation

  Annotations for Models.
- class annotation_undelta

  the undelta class for annotation changes
- class annotation_delta

  the delta class for annotation changes
- class no_certificate

  The not-certified certificate.
- class split_certificate

  The certificate for deltas formed by splits.
- class compound_certificate

  The certificate for deltas formed by compressing bound_delta entries.
- class rigorous_module_certificate

  The certificate for deltas computed by rigorous inference engines.
- class certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class certificate_base

  Base class for the certificates.
- class delta_get_action

  Stored procedure class for computing the delta action specifier.
- class delta

  The delta class (updates to work nodes)
- class delta_base

  Base class for the deltas.
- class undelta

  The undelta class (undo of updates to work nodes)
- class undelta_base

  Base class for the undeltas.
- class api_exception

  API exception class.
- class nyi_exception

Not Yet Implemented exception class.

- class basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class bbfunc

  The bbfunc class (black box function)
- class bbfunc_expr

  The bbfunc_expr class (black box function expression)
- struct b_interval_eval_type
- class b_interval_eval
- class bound_undelta

  The bound undelta class for undoing changes to the node bounds in a model.
- class bound_delta

  The bound delta class for changing the node bounds within a model.
- class boxes_delta

  A delta class which adds new boxes to the search database.
- struct cinterval_eval_type
- class cinterval_eval
- struct coconut_random_f
- class work_node_comp_hook

  The work_node_comp_hook class (work node computation hook)
- class wnc_hook_base

  Base class for the work node computation hooks.
- class control_data

  The class for communicating parameter information to COCONUT modules.
- class convex_e

  Convexity information.
- struct cmp_point_info_i
- struct cmp_point_info_s
- class d1func

  The d1func class (one dimensional function)
- class d1func_expr

  The d1func_expr class (one dimensional function expression)
- union double_to_uint64_u
- class testpoly_func
- class one_over_x_func
- class dag_undelta

  The DAG undelta class for undoing changes to the DAG of a model.
- class dag_delta

  The DAG delta class for performing changes to the DAG of a model.
- class dag_d1func

  The dag_d1func class (one dimensional function)
- class compare_intervals
- struct dd1f_interval_eval_type

  Visitor data for dd1f_interval_eval.
- class dd1f_interval_eval

  Forward function range evaluation.
- struct polsppt_ret_type

Return type for polsppt_eval.

- struct polsppt_eval_type

  Visitor data for polsppt_eval.
- class polsppt_eval

  Forward function range evaluation.
- class datamap

  The base class for communicating with COCONUT modules.
- class dbt_row

  This type is used to hold one row in some table of the search database.
- class dbccmps_gt
- class dbccmps_absgt
- class dbccmps_lt
- class dbccmps_abslt
- class dbccmps_true
- class dbccmps_false
- struct dbccmp_true
- struct dbccmp_false
- class point_check_feasibility

  Stored procedure checking the feasibility of a point.
- class box_check_intersection

  Stored procedure checking whether a box intersects the work_node's box.
- struct defdom_ret_type

  Return type for defdom_eval.
- struct defdom_problem_point
- struct defdom_eval_type

  Visitor data for defdom_eval.
- class defdom_eval

  Forward function range evaluation.
- class prep_d_eval

  Preparation Evaluator for derivatives.
- struct func_d_eval_type

  Visitor data for func_d_eval.
- class func_d_eval

  Forward function evaluation with preparation of derivative data.
- struct der_eval_type

  Visitor data for der_eval.
- class der_eval

  Backward gradient evaluation with prepared derivative data.
- struct dfunc_eval_rettype
- struct dfunc_eval_type
- class dfunc_eval
- class diameter_comp_hook

  The log-volume computation hook (work node computation hook)
- class diffI
- class diffNumber
- class variable_indicator

  Bitmap class used to indicate variable occurrence.
- class _evaluator_base

Base class of all evaluators.

- class evaluator_base

  Base class of all (non-caching) evaluators.
- class cached_evaluator_base

  Base class of all caching evaluators.
- class forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class backward_evaluator_base

  Base class of all (non-caching) backward evaluators.
- class cached_forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class cached_backward_evaluator_base

  Base class of all caching backward evaluators.
- class expression_node

  The base class for a node in the expression DAGs.
- class expression_print_visitor
- struct func_eval_type

  Visitor data for func_eval.
- class func_eval

  Forward function evaluation.
- class graph_analyzer_exception

  Graph analyzer exception class.
- class graph_analyzer

  Graph analyzer base class.
- class graphorder_visitor

  This visitor class is used for computing a graph order.
- struct hessPreparationEvaluatorType
- class hessPreparationEvaluator
- struct hessForwardEvaluatorReturnValue
- struct hessForwardEvaluatorType
- class hessForwardEvaluator
- struct hessBackwardEvaluatorType
- class hessBackwardEvaluator
- class hessNumber
- class hsf_func

  The hsf_func class (one dimensional function)
- class prep_id_eval

  Preparation Evaluator for interval derivatives.
- struct func_id_eval_type

  Visitor data for func_id_eval.
- class func_id_eval

  Forward function range evaluation with preparation of interval derivative data.
- struct ider_eval_type

  Visitor data for ider_eval.
- class ider_eval

  Backward interval gradient evaluation with prepared interval derivative data.
- struct iderf_ret_type

Visitor data for iderf_eval return value.

- struct iderf_eval_type

  Visitor data for iderf_eval.
- class iderf_eval

  Forward function and derivative range evaluation.
- class ie_return_type

  The return class of all inference engines.
- class statistic_info

  Base class for all inference engine statistics classes.
- struct ihessPreparationEvaluatorType
- class ihessPreparationEvaluator
- struct ihessForwardEvaluatorReturnValue
- struct ihessForwardEvaluatorType
- class ihessForwardEvaluator
- struct ihessBackwardEvaluatorType
- class ihessBackwardEvaluator
- class ihessNumber
- class inference_module_cache_autogen

  Inference module cache auto-generate method base class.
- class inference_module_cache

  Inference module cache class.
- struct infbound_eval_type
- class infbound_eval
- class infeasible_undelta

  The infeasible undelta class for undoing changes to the feasibility of a model.
- class infeasible_delta

  The infeasible delta class for marking a model as infeasible.
- class inference_engine_comp_hook

  The inference engine meta computation hook (work node computation hook)
- class inference_engine_exception

  Inference engine exception class.
- class inference_engine

  Inference engine base class.
- class info_contents

  The class for returning additional information from inference modules.
- class initializer_exception

  Initializer exception class.
- class initializer

  Initializer base class.
- struct interval_eval_type

  Visitor data for interval_eval.
- class interval_eval

  Forward function range evaluation.
- struct checking_my
- struct my_rounded_math
- struct interval_st

  Constructor-free interval.

- class interval

  Interval wrapper class.
- class interval_set
- struct Islope_eval_type

  Visitor data for Islope_eval.
- class Islope_eval

  Forward function range evaluation.
- struct prep_islp2_eval_type
- class prep_islp2_eval
- struct func_islp2_eval_ret_type
- struct func_islp2_eval_type
- class func_islp2_eval
- struct islp2_eval_type_INTERNAL
- class islp2_eval_INTERNAL
- struct func_islp_return_type

  The return type of the func_islp_eval evaluator.
- class prep_islp_eval

  Preparation Evaluator for first order slopes.
- struct func_islp_eval_type

  Visitor data for func_id_eval.
- class func_islp_eval

  Forward function range evaluation with preparation of first order slope data.
- struct islp_eval_type_INTERNAL

  Visitor data for islp_eval.
- class islp_eval_INTERNAL

  Backward first order slope evaluation with prepared first order slope data.
- struct ithirdderPreparationEvaluatorType
- class ithirdderPreparationEvaluator
- struct ithirdderForwardEvaluatorReturnValue
- struct ithirdderForwardEvaluatorType
- class ithirdderForwardEvaluator
- struct ithirdderBackwardEvaluatorType
- class ithirdderBackwardEvaluator
- class locopt_ret_record
- class logvol_comp_hook

  The log-volume computation hook (work node computation hook)
- class memory_comp_hook

  The memory computation hook (work node computation hook)
- class management_module_exception

  Management module exception class.
- class management_module

  Management module base class.
- class model

  The model class (an attributed DAG of expression nodes, lowest class in the model hierarchy)
- class model_iddata

  The model id-data class (the topmost in the model class hierarchy)
- class model_gid

  Model Group Data Class (middle class in the model hierarchy)

- class d1func_visitor_0
- class d1func_visitor_1
- struct xxxNumber_eval_type

  Visitor data for xxxNumber_eval.
- class xxxNumber_eval

  Forward function range evaluation.
- class objbounds_comp_hook

  The objective-bounds computation hook (work node computation hook)
- class pending_status_comp_hook

  The pending status computation hook (work node computation hook)
- class calc_pf_star

  Stored procedure calculating the pf∗ value of a box.
- class pfstar_hook

  The pfstar computation hook (work node computation hook)
- class point_delta

  A delta class which adds new points to the search database.
- class proj_rational
- class projective_interval
- class report_module_exception

  Report module exception class.
- class report_module

  Report module base class.
- class sum_deltas

  Pre-post visitor for summing up all the deltas during work node extraction.
- class __sg_anc_visitor
- class search_graph

  The search graph.
- class search_node

  Base type of the nodes in the search graph.
- class delta_node

  Class holding the delta nodes in the search graph.
- class full_node

  Class holding the full nodes in the search graph.
- class work_node

  Work node, which is passed to the inference engines.
- class semantics

  Expression Semantics.
- class semantics_undelta

  The semantics undelta class for undoing changes to the node semantics in a model.
- class semantics_delta

  The semantics delta class for changing the node semantics within a model.
- class search_graph_context

  An evaluation context when retrieving from the search database.
- class sparsity_visitor

  Preorder visitor which calculates sparsity structures.
- class sparsity3_visitor

  Preorder visitor which calculates sparsity structures.

- class split_undelta

  The split undelta class for removing proposed splits from a work_node.
- class split_delta

  The split delta class for proposing useful splits.
- class table_delta

  The base class for all deltas adding information to the search database.
- class termination_reason

  This class holds the reason of termination of inference and management modules.
- struct thirdderPreparationEvaluatorType
- class thirdderPreparationEvaluator
- struct thirdderForwardEvaluatorReturnValue
- struct thirdderForwardEvaluatorType
- class thirdderForwardEvaluator
- struct thirdderBackwardEvaluatorType
- class thirdderBackwardEvaluator
- class vol_comp_hook

  The volume computation hook (work node computation hook)
- class work_node_context

  The evaluation context when retrieving from the search database.
- class xexp_func

  The xexp_func class (one dimensional function)

Typedefs

- typedef basic_alltype additional_info_u

  type definition for backwards compatibility with earlier API versions
- typedef analyticd(∗ analyticd_evaluator)(const std::vector< analyticd > ∗__x, const variable_indicator &__v)
- typedef std::vector< std::pair < vdbl::tableid, vdbl::rowid > > trvec
- typedef vdbl::rowid delta_id

  The class for delta ids.
- typedef b_interval(∗ b_interval_evaluator)(const std::vector< b_interval > ∗__x, const variable_indicator &__v)
- typedef cinterval(∗ cinterval_evaluator)(const std::vector< cinterval > ∗__x, const variable_indicator &__v)
- typedef long int rand_t
- typedef enum coco::tristate_e tristate
- typedef uint32_t search_node_id

  Type of the unique search node identifier.
- typedef interval(∗ dd1f_interval_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)
- typedef polsppt_ret_type(∗ polsppt_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)
- typedef std::triple < d1func::d1func_point_t, diffI, int > polsppt_info
- typedef std::multimap < unsigned int, polsppt_info > polsppt_info_map
- typedef std::map< interval, polsppt_info_map, compare_intervals > polsppt_interval_map
- typedef std::multimap < unsigned int, polsppt_info_map::const_iterator > polsppt_map_map
- typedef std::multimap < unsigned int, defdom_problem_point > defdom_map

- typedef defdom_ret_type(∗ defdom_evaluator)(const std::vector< interval > ∗__x, defdom_map &__m, const variable_indicator &__v)
- typedef double(∗ func_evaluator)(const std::vector< double > ∗__x, const variable_indicator &__v)
- typedef interval rhs_t
- typedef std::vector< void ∗ > evaluator_v
- typedef ie_return_type ga_return_type

  Graph analyzer return type.
- typedef iderf_ret_type(∗ iderf_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)
- typedef infbound(∗ infbound_evaluator)(const std::vector< infbound > ∗__x, const variable_indicator &__v)
- typedef interval(∗ interval_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)
- typedef boost::numeric::interval_lib::policies < my_rounded_math< double > , checking_my< double >> my_policies
- typedef Islope(∗ Islope_evaluator)(const std::vector< Islope > ∗__x, const variable_indicator &__v)
- typedef std::map< int, locopt_ret_record > locopt_ret
- typedef model::walker expression_walker

  Walker to the expression DAG.
- typedef model::const_walker expression_const_walker

  Const walker to the expression DAG.
- typedef xxxNumber_t(∗ xxxNumber_evaluator)(const std::vector< xxxNumber_t > ∗__x, const variable_indicator &__v)
- typedef search_graph::const_walker search_inspector

  The search inspector for graph analysis.
- typedef search_graph::walker search_focus

  The search focus for work node selection.
- typedef std::pair< vdbl::rowid, search_node_id > si_ri_pair
- typedef std::pair< unsigned int, unsigned int > ipair

  Row-column index pair.
- typedef std::set< ipair > splist

  Sparsity information.
- typedef std::triple< unsigned int, unsigned int, unsigned int > itriple

  Row-column-depth index triple.
- typedef std::set< itriple > stlist

  Sparsity information.

- typedef bool(∗ prep_d_evaluator)()
- typedef double(∗ func_d_evaluator)(const std::vector< double > ∗__x, const variable_indicator &__v, std::vector< double > &__d_data)
- typedef std::vector< double > &(∗ der_evaluator)(const std::vector< double > &__d_dat, const variable_indicator &__v)

- typedef bool(∗ prep_id_evaluator)()
- typedef interval(∗ func_id_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v, std::vector< interval > &__id_data)
- typedef std::vector< interval > &(∗ ider_evaluator)(const std::vector< interval > &__d_dat, const variable_indicator &__v)

- typedef bool(∗ prep_islp_evaluator)()
- typedef func_islp_return_type(∗ func_islp_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v, std::vector< interval > &__islp_data)
- typedef std::vector< interval > &(∗ islp_evaluator)(const std::vector< interval > &__d_dat, const variable_indicator &__v)

Enumerations

- enum api_exception_type { apiee_internal = 1, apiee_evaluator = 2, apiee_io = 3, apiee_delta = 4, apiee_search_graph = 5, apiee_communication_data = 6, apiee_inference_engine = 7, apiee_graph_analyzer = 8, apiee_management_module = 9, apiee_initializer = 10, apiee_report_module = 11, apiee_oom = 12, apiee_nyi = 13, apiee_other = 14 }

  Enum for classifying api_exceptions.
- enum tristate_e { t_true = 1, t_false = -1, t_maybe = 0 }
- enum convex_info { c_convex = 1, c_linear = 0, c_concave = -1, c_maybe = 2, c_not = -2, c_constant = 3 }

  Convexity information enum.
- enum d1func_monotonicity_t { d1fpmon_dec = -1, d1fpmon_const = 0, d1fpmon_inc = 1, d1fpmon_unclear = 2, d1fpmon_nonmon = -2 }

  The d1func_monotonicity_t enum.
- enum dbc_method { dbc_cmp_eq = DB_COMPARE_CMP_EQ, dbc_cmp_ne = DB_COMPARE_CMP_NE, dbc_cmp_gt = DB_COMPARE_CMP_GT, dbc_cmp_ge = DB_COMPARE_CMP_GE, dbc_cmp_lt = DB_COMPARE_CMP_LT, dbc_cmp_le = DB_COMPARE_CMP_LE, dbc_cmp_in = DB_COMPARE_CMP_IN, dbc_cmp_abseq = DB_COMPARE_CMP_ABSEQ, dbc_cmp_absne = DB_COMPARE_CMP_ABSNE, dbc_cmp_absgt = DB_COMPARE_CMP_ABSGT, dbc_cmp_absge = DB_COMPARE_CMP_ABSGE, dbc_cmp_abslt = DB_COMPARE_CMP_ABSLT, dbc_cmp_absle = DB_COMPARE_CMP_ABSLE, dbc_cmp_absin = DB_COMPARE_CMP_ABSIN, dbc_sort_min = DB_COMPARE_SORT_MIN, dbc_sort_max = DB_COMPARE_SORT_MAX, dbc_sort_absmin = DB_COMPARE_SORT_ABSMIN, dbc_sort_absmax = DB_COMPARE_SORT_ABSMAX, dbc_sort_true = DB_COMPARE_SORT_TRUE, dbc_sort_false = DB_COMPARE_SORT_FALSE }
- enum e_expression_type { ex_bound = 1, ex_linear = 1<<1, ex_quadratic = 1<<2, ex_polynomial = 1<<3, ex_other = 1<<4, ex_kj = 1<<7, ex_org = 1<<8, ex_redundant = 1<<9, ex_notredundant = 1<<10, ex_active_lo = 1<<11, ex_inactive_lo = 1<<12, ex_active_hi = 1<<13, ex_inactive_hi = 1<<14, ex_active = ex_active_lo|ex_active_hi, ex_inactive = ex_inactive_lo|ex_inactive_hi, ex_integer = 1<<15, ex_exists = 1<<16, ex_forall = 1<<17, ex_free = 1<<18, ex_stochastic = 1<<19, ex_convex = 1<<20, ex_concave = 1<<21, ex_inequality = 1<<28, ex_equality = 1<<29, ex_leftbound = 1<<30, ex_rightbound = 1<<31, ex_atmlin = ex_bound|ex_linear, ex_atmquad = ex_atmlin|ex_quadratic, ex_atmpoly = ex_atmquad|ex_polynomial, ex_nonlin = ex_quadratic|ex_polynomial|ex_other, ex_nonbnd = ex_linear|ex_nonlin, ex_any = ex_atmlin|ex_nonlin, ex_bothbound = ex_leftbound|ex_rightbound }

- enum search_node_relation { snr_root, snr_reduction, snr_relaxation, snr_split, snr_glue, snr_worknode, snr_virtual }

  Enum specifying node relations in the search graph.
- enum type_annotation { v_exists = 0, v_forall = 1, v_free = 2, v_stochastic = 3 }

  Node type information enum.
- enum activity_descr { a_redundant = 1, a_active_lo = 2, a_active_lo_red = a_active_lo|a_redundant, a_active_hi = 4, a_active_hi_red = a_active_hi|a_redundant, a_active = a_active_lo|a_active_hi, a_active_red = a_active|a_redundant }

  Constraint activity information enum.
- enum sp_indexing { full_indexing = 0, row_wise_indexing = 1, column_wise_indexing = 2, full_indexing = 0, row_wise_indexing = 1, column_wise_indexing = 2 }
- enum sp_indexing { full_indexing = 0, row_wise_indexing = 1, column_wise_indexing = 2, full_indexing = 0, row_wise_indexing = 1, column_wise_indexing = 2 }

Functions

- std::ostream & operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.
- std::ostream & operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.
- interval flb (const interval &x1, const interval &x2, const interval &x3)
- interval asqr_find_f1min (const interval &c1, const interval &c3, const interval &x2)
- interval eval_asqr (const interval &x1, const interval &x2, const interval &x3)
- const basic_alltype & basic_alltype_empty ()
- std::ostream & operator<< (std::ostream &os, const basic_alltype &b)
- bool less_than (const basic_alltype &a, const basic_alltype &b)
- bool less_equal (const basic_alltype &a, const basic_alltype &b)
- double d_random ()
- double r_random_h_eval (double t, double b, double a)
- double r_random_hinv_eval (double x, double b, double a)
- double r_random (double l, double u, double beta=10.0, double alpha=0.9)
- double r_random (const interval &_i, double beta=10.0, double alpha=0.9)
- interval i_random (double l, double r, double beta=10.0, double alpha=0.9)
- interval i_random (const interval &_i, double beta=10.0, double alpha=0.9)
- interval i_random ()
- bool operator== (const convex_e &__c, const convex_e &__d)

  Equality comparison operator.
- bool operator== (const convex_e &__c, const convex_info &__d)
- bool operator== (const convex_info &__c, const convex_e &__d)
- bool operator!= (const convex_e &__c, const convex_e &__d)

  Disequality comparison operator.
- bool operator!= (const convex_e &__c, const convex_info &__d)
- bool operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & operator<< (std::ostream &o, const convex_e &__s)

  C++ stream output operator for convex_e.
- d1func_monotonicity_t operator- (d1func_monotonicity_t x)

  The d1func_monotonicity_t unary minus.

- interval _internal_imperfect_eval (const interval &x, unsigned int k, const expression_const_walker &result, const model *mod, const variable_indicator &vind, const std::map< unsigned int, d1func * > *p_infos)
- interval_set intersect_inv_hlp (d1func *d1help, const interval &xx, const interval_set &r, int order)

  Sparsity calculation (Jacobian)
- void sparsity3 (const model &DAG, std::vector< unsigned int > &H_ridx, std::vector< unsigned int > &H_cidx, std::vector< unsigned int > &J_funidx, std::vector< unsigned int > &J_varidx, bool J_with_obj, bool J_obj_is_first, bool org_only, bool H_upper_only, sp_indexing indexing, bool fun_one_based, bool var_one_based)

  Sparsity calculation (Hessian and Jacobian)
- void sparsity3 (const model &DAG, std::vector< unsigned int > &H_ridx, std::vector< unsigned int > &H_cidx, bool org_only, bool H_upper_only, sp_indexing indexing, bool var_one_based)

  Sparsity calculation (Hessian)
- void sparsity3 (const model &DAG, std::vector< unsigned int > &J_funidx, std::vector< unsigned int > &J_varidx, bool J_with_obj, bool J_obj_is_first, bool org_only, sp_indexing indexing, bool fun_one_based, bool var_one_based)

  Sparsity calculation (Jacobian)
- void set_translation_map (const std::map< std::string, std::string > &tr_msg_map)

  A datamap function for setting the message translation map.
- const std::string & get_translated_message (const std::string &msg)

  A datamap function for message translation.
- std::ostream & operator<< (std::ostream &o, const termination_reason &__x)

  C++ stream output operator for the termination_reason.
- std::string i2a (int x)

  converter int -> string
- std::string datetime (const struct tm *timeptr)

  local time as C++ string
- std::string localdatetime ()

  converter date & time into std::string
- std::string e2D (double d)

  Fortran real as C++ string.

9.1.1 Detailed Description

This is the main namespace holding all classes and functions of the COCONUT-Environment API.

9.1.2 Typedef Documentation

9.1.2.1 typedef analyticd(* coco::analyticd_evaluator)(const std::vector< analyticd > *__x, const variable_indicator &__v)

Definition at line 46 of file ade_evaluator.h.

9.1.2.2 typedef b_interval(* coco::b_interval_evaluator)(const std::vector< b_interval > *__x, const variable_indicator &__v)

Definition at line 46 of file bint_evaluator.h.

9.1.2.3 typedef cinterval(* coco::cinterval_evaluator)(const std::vector< cinterval > *__x, const variable_indicator &__v)

Definition at line 46 of file cint_evaluator.h.

9.1.2.4 typedef interval(∗ coco::dd1f_interval_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 48 of file dagd1func_ie.h.

9.1.2.5 typedef defdom_ret_type(∗ coco::defdom_evaluator)(const std::vector< interval > ∗__x, defdom_map &__m, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 78 of file defdom_evaluator.h.

9.1.2.6 typedef std::multimap<unsigned int,defdom_problem_point> coco::defdom_map

Definition at line 75 of file defdom_evaluator.h.

9.1.2.7 typedef std::vector<double>&(∗ coco::der_evaluator)(const std::vector< double > &__d_dat, const variable_indicator &__v)

Functions of these types need to be defined for all user defined nodes.

Definition at line 53 of file der_evaluator.h.

9.1.2.8 typedef std::vector<void∗> coco::evaluator_v

This type defines the type of the standard evaluators for user defined nodes.

Definition at line 462 of file expression.h.

9.1.2.9 typedef enum coco::fset_type coco::fset_type_t

9.1.2.10 typedef double(∗ coco::func_d_evaluator)(const std::vector< double > ∗__x, const variable_indicator &__v, std::vector< double > &__d_data)

Functions of these types need to be defined for all user defined nodes.

Definition at line 50 of file der_evaluator.h.

9.1.2.11 typedef double(∗ coco::coco::func_evaluator)(const std::vector< double > ∗__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 45 of file dfunc_evaluator.h.

9.1.2.12 typedef interval(∗ coco::func_id_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v, std::vector< interval > &__id_data)

Functions of these types need to be defined for all user defined nodes.

Definition at line 51 of file ider_evaluator.h.

9.1.2.13 typedef func_islp_return_type(∗ coco::func_islp_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v, std::vector< interval > &__islp_data)

Functions of these types need to be defined for all user defined nodes.

Definition at line 63 of file islp_evaluator.h.

9.1.2.14 typedef enum coco::func_type coco::func_type_t

9.1.2.15 typedef std::vector<interval>&(∗ coco::ider_evaluator)(const std::vector< interval > &__d_dat, const variable_indicator &__v)

Functions of these types need to be defined for all user defined nodes.

Definition at line 54 of file ider_evaluator.h.

9.1.2.16 typedef iderf_ret_type(∗ coco::iderf_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 56 of file iderf_evaluator.h.

9.1.2.17 typedef infbound(∗ coco::infbound_evaluator)(const std::vector< infbound > ∗__x, const variable_indicator &__v)

Definition at line 46 of file infb_evaluator.h.

9.1.2.18 typedef interval(∗ coco::interval_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 48 of file int_evaluator.h.

9.1.2.19 typedef Islope(∗ coco::Islope_evaluator)(const std::vector< Islope > ∗__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 46 of file Islope_evaluator.h.

9.1.2.20 typedef std::vector<interval>&(∗ coco::islp_evaluator)(const std::vector< interval > &__d_dat, const variable_indicator &__v)

Functions of these types need to be defined for all user defined nodes.

Definition at line 66 of file islp_evaluator.h.

9.1.2.21 typedef std::map<int,locopt_ret_record> coco::locopt_ret

Definition at line 63 of file locopt_ret.h.

9.1.2.22 typedef boost::numeric::interval_lib::policies< my_rounded_math<double>, checking_my<double>> coco::my_policies

Definition at line 100 of file interval_boost.h.

9.1.2.23 typedef polsppt_ret_type(* coco::polsppt_evaluator)(const std::vector< interval > *__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 57 of file dagd1func_pv.hpp.

9.1.2.24 typedef std::triple<d1func::d1func_point_t,diffI,int> coco::polsppt_info

Definition at line 60 of file dagd1func_pv.hpp.

9.1.2.25 typedef std::multimap<unsigned int, polsppt_info> coco::polsppt_info_map

Definition at line 62 of file dagd1func_pv.hpp.

9.1.2.26 typedef std::map<interval,polsppt_info_map,compare_intervals> coco::polsppt_interval_map

Definition at line 64 of file dagd1func_pv.hpp.

9.1.2.27 typedef std::multimap<unsigned int, polsppt_info_map::const_iterator> coco::polsppt_map_map

Definition at line 67 of file dagd1func_pv.hpp.

9.1.2.28 typedef bool(* coco::prep_d_evaluator)()

Functions of these types need to be defined for all user defined nodes.

Definition at line 49 of file der_evaluator.h.

9.1.2.29 typedef bool(* coco::prep_id_evaluator)()

Functions of these types need to be defined for all user defined nodes.

Definition at line 50 of file ider_evaluator.h.

9.1.2.30 typedef bool(* coco::prep_islp_evaluator)()

Functions of these types need to be defined for all user defined nodes.

Definition at line 62 of file islp_evaluator.h.

9.1.2.31 typedef interval coco::rhs_t

This type is the allowed type for constraint restrictions.

Definition at line 459 of file expression.h.

9.1.2.32 typedef std::pair<vdbl::rowid, search_node_id> coco::si_ri_pair

Definition at line 35 of file search_graph_funcs.h.

9.1.2.33 typedef enum coco::coco::tristate_e coco::coco::tristate

The tristate type is a boolean with the addition of a maybe value

9.1.2.34 typedef std::vector<std::pair<vdbl::tableid,vdbl::rowid> > coco::trvec

Definition at line 33 of file annotation_delta.cc.

9.1.2.35 typedef xxxNumber_t(* coco::xxxNumber_evaluator)(const std::vector< xxxNumber_t > *__x, const variable_indicator &__v)

Functions of this type need to be defined for all user defined nodes.

Definition at line 62 of file numfeval.h.

9.1.3 Enumeration Type Documentation

9.1.3.1 enum coco::activity_descr

This enum describes the activity state known about a constraint and whether it is redundant or not. The meaning of the enum entries is:

- `a_redundant`: The constraint is known to be redundant. There can be two reasons for that. It can be inactive on both sides, or it was constructed, knowing that it would be redundant (e.g. cuts).
- `a_active_lo`: The `work_node` may contain points, for which this constraint is active at the lower bound but no points, for which the constraint is active at the upper bound.
- `a_active_hi`: The `work_node` may contain points, for which this constraint is active at the upper bound but no points, for which the constraint is active at the lower bound.
- `a_active`: The `work_node` may contain points, for which this constraint is active at the upper bound and points, for which the constraint is active at the lower bound.
- ..._red: A combination with `_red` means that although the inactivity of the constraint could not be proved, it is still known to be redundant.

Enumerator:

a_redundant
a_active_lo
a_active_lo_red
a_active_hi
a_active_hi_red
a_active
a_active_red

Definition at line 81 of file semantics.h.

9.1.3.2 enum coco::convex_info

This enum is used to store information about the convexity of a node or an expression.

Enumerator:

c_convex The expression is convex and not linear

c_linear The expression is linear

c_concave The expression is concave and not linear

c_maybe The convexity type of the expression is unknown

c_not The expression is neither convex nor concave

c_constant The expression is constant

Definition at line 45 of file convex_info.h.

9.1.3.3 enum coco::dbc_method

Enumerator:

dbc_cmp_eq

dbc_cmp_ne

dbc_cmp_gt

dbc_cmp_ge

dbc_cmp_lt

dbc_cmp_le

dbc_cmp_in

dbc_cmp_abseq

dbc_cmp_absne

dbc_cmp_absgt

dbc_cmp_absge

dbc_cmp_abslt

dbc_cmp_absle

dbc_cmp_absin

dbc_sort_min

dbc_sort_max

dbc_sort_absmin

dbc_sort_absmax

dbc_sort_true

dbc_sort_false

Definition at line 64 of file dbcompare.h.

9.1.3.4 enum coco::e_expression_type

This enum is used for determining the type of the expression in the `is` method and similar methods and operators

Enumerator:

ex_bound a variable
ex_linear linear (but not a single variable)
ex_quadratic quadratic non-linear
ex_polynomial non-quadratic polynomial
ex_other non-polynomial non-linear
ex_kj only additional vars, constr. from KJ-conditions
ex_org original vars, constr. (ex_kj, ex_org both set = none set)
ex_redundant this constraint is known to be redundant
ex_notredundant this constraint is known to be not redundant
ex_active_lo this constraint is possible active at the lower bound
ex_inactive_lo this constraint is inactive at the lower bound
ex_active_hi this constraint is possible active at the upper bound
ex_inactive_hi this constraint is inactive at the upper bound
ex_active this constraint is possible active
ex_inactive this constraint is inactive
ex_integer this expression is an integer expression
ex_exists this variable has an exist-context
ex_forall this variable has a for-all-context
ex_free this variable is free
ex_stochastic this variable is a stochastic variable
ex_convex this expression is known to be convex
ex_concave this expression is known to be concave
ex_inequality this is an inequality constraint
ex_equality this is an equality constraint
ex_leftbound this is a constraint with lower bound
ex_rightbound this is a constraint with upper bound
ex_atmlin at most linear
ex_atmquad at most quadratic
ex_atmpoly at most polynomial
ex_nonlin non linear
ex_nonbnd not bounds
ex_any any
ex_bothbound this is a two-sided constraint

Definition at line 402 of file expression.h.

9.1.3.5 enum coco::fset_type

Enumerator:

fset_unbd
fset_box
fset_lin
fset_iquad
fset_equad
fset_ipoly
fset_epoly
fset_inonpoly
fset_enonpoly

Definition at line 39 of file structure_defs.h.

9.1.3.6 enum coco::func_type

Enumerator:

func_const
func_lin
func_quad
func_poly
func_nonpoly

Definition at line 36 of file structure_defs.h.

9.1.3.7 enum coco::sp_indexing

Available indexing methods for storing the nonzero positions of sparse matrices full_indexing: the row and column index vectors have the same length and the vectors specify pairs of row and column indices;

row_wise_indexing: the column vector contains the column indices of the nonzeros row-by-row. The number of nonzeros in row i (i=0..r.size()-2) is given by r[i+1]-r[i]; if this number is nonzero, then r[i] contains the index of the column vector, where the non-zero column indices for this row start. Zero rows in the bottom of the matrix does not appear in r; that is, the index i=r.size()-1 is the last nonzero row of the matrix, and r[i] contains the index of the column vector, where the non-zero column indices for this row start.

column_wise_indexing: this is the same as row_wise_indexing, with the roles of the row and column index vectors interchanged.

Enumerator:

full_indexing
row_wise_indexing
column_wise_indexing
full_indexing
row_wise_indexing
column_wise_indexing

Definition at line 54 of file sparsity.h.

9.1.3.8 enum coco::sp_indexing

Available indexing methods for storing the nonzero positions of sparse 3-tensors full_indexing: the row, column, and depth index vectors have the same length and the vectors specify triples of row, column, and depth indices;

row_wise_indexing: the column vector contains the column indices of the nonzeros row-by-row. The number of nonzeros in row i (i=0..r.size()-2) is given by r[i+1]-r[i]; if this number is nonzero, then r[i] contains the index of the column vector, where the non-zero column indices for this row start. Zero rows in the bottom of the matrix does not appear in r; that is, the index i=r.size()-1 is the last nonzero row of the matrix, and r[i] contains the index of the column vector, where the non-zero column indices for this row start.

column_wise_indexing: this is the same as row_wise_indexing, with the roles of the row and column index vectors interchanged.

Enumerator:

full_indexing

row_wise_indexing

column_wise_indexing

full_indexing

row_wise_indexing

column_wise_indexing

Definition at line 55 of file sparsity3.h.

9.1.3.9 enum coco::tristate_e

The tristate type is a boolean with the addition of a maybe value

Enumerator:

t_true

t_false

t_maybe

Definition at line 36 of file coconut_types.h.

9.1.3.10 enum coco::type_annotation

This enum is used to store information about the type of a node or an expression.

Enumerator:

v_exists The expression/variable is interpreted in a exists context.

v_forall The expression/variable is interpreted in a forall context.

v_free This is valid for variables only, and it defines a free variable.

v_stochastic This expression is stochastic.

Definition at line 46 of file semantics.h.

9.1.4 Function Documentation

9.1.4.1 std::ostream& coco::__wr_interval (std::ostream & *o,* const interval & *__i*) [inline]

This is an internal routine for writing an interval in the .dag format ("-I" for −COCO_INF and "I" for COCO_INF).

Definition at line 344 of file expression.hpp.

9.1.4.2 void coco::_internal_graphorder (const model & *DAG,* std::vector< unsigned int > & *order,* std::vector< unsigned int > * *inv_order*) [inline]

Definition at line 95 of file graphorder.cc.

9.1.4.3 interval coco::_internal_imperfect_eval (const interval & *x,* unsigned int *k,* const expression_const_walker & *result,* const model * *mod,* const variable_indicator & *vind,* const std::map< unsigned int, d1func * > * *p_infos*) [inline]

Definition at line 204 of file dagd1func.cc.

9.1.4.4 hessNumber coco::abs (const hessNumber & *a*)

Definition at line 115 of file hessNumber.cc.

9.1.4.5 proj_rational coco::abs (const proj_rational & *r*) [inline]

Definition at line 120 of file prointerval.h.

9.1.4.6 ihessNumber coco::abs (const ihessNumber & *a*)

Definition at line 130 of file ihessNumber.cc.

9.1.4.7 diffNumber coco::abs (const diffNumber & *a*)

Definition at line 145 of file diffNumber.cc.

9.1.4.8 interval coco::abs (const interval & *x*)

Returns an interval enclosure of the absolute value of the interval x.

9.1.4.9 diffI coco::abs (const diffI & *a*)

Definition at line 684 of file diffI.cc.

9.1.4.10 interval_set coco::abs (const interval_set & *a*)

Definition at line 847 of file interval_set.cc.

9.1.4.11 template<class I > projective_interval<I> coco::abs (const projective_interval< I > & *x*)

Definition at line 879 of file prointerval.hpp.

9.1.4.12 double coco::absmin (const interval & __i) [inline]

This function returns the element of __i with smallest absolute value.

Definition at line 784 of file interval_boost.h.

9.1.4.13 interval coco::acos (const interval & x)

Returns an interval enclosure of the inverse cosine of the interval x.

9.1.4.14 template<class I > projective_interval<I> coco::acos (const projective_interval< I > & x)

Definition at line 870 of file prointerval.hpp.

9.1.4.15 interval_set coco::acos (const interval_set & a)

Definition at line 919 of file interval_set.cc.

9.1.4.16 interval coco::acosh (const interval & x)

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

9.1.4.17 template<class I > projective_interval<I> coco::acosh (const projective_interval< I > & x)

Definition at line 887 of file prointerval.hpp.

9.1.4.18 interval_set coco::acosh (const interval_set & a)

Definition at line 1015 of file interval_set.cc.

9.1.4.19 interval coco::acot (const interval & x)

Returns an interval enclosure of the inverse cotangent of the interval x.

9.1.4.20 template<class I > projective_interval<I> coco::acot (const projective_interval< I > & x)

Definition at line 896 of file prointerval.hpp.

9.1.4.21 interval_set coco::acot (const interval_set & a)

Definition at line 931 of file interval_set.cc.

9.1.4.22 interval coco::acoth (const interval & x)

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

9.1.4.23 template<class I > projective_interval<I> coco::acoth (const projective_interval< I > & x)

Definition at line 905 of file prointerval.hpp.

9.1.4.24 interval_set coco::acoth (const interval_set & a)

Definition at line 1027 of file interval_set.cc.

9.1.4.25 interval coco::asin (const interval & *x*)

Returns an interval enclosure of the inverse sine of the interval x.

9.1.4.26 interval_set coco::asin (const interval_set & *a*)

Definition at line 907 of file interval_set.cc.

9.1.4.27 template<class I > projective_interval<I> coco::asin (const projective_interval< I > & *x*)

Definition at line 914 of file prointerval.hpp.

9.1.4.28 interval coco::asinh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

9.1.4.29 template<class I > projective_interval<I> coco::asinh (const projective_interval< I > & *x*)

Definition at line 923 of file prointerval.hpp.

9.1.4.30 interval_set coco::asinh (const interval_set & *a*)

Definition at line 1003 of file interval_set.cc.

9.1.4.31 interval coco::asqr_find_f1min (const interval & *c1,* const interval & *c3,* const interval & *x2*) [inline]

Here we find a guaranteed enclosure for the minimum of f1(p2) = (c3-p2+c1)^2 + 4∗c1∗p2 = p2^2 + 2∗p2∗(c1-c3) + c3^2 + c1^2 + 2∗c1∗c3, with p2 x2, where c1 and c3 are constant point intervals.

Definition at line 51 of file asqr.h.

9.1.4.32 hessNumber coco::atan (const hessNumber & *a*)

Definition at line 230 of file hessNumber.cc.

9.1.4.33 ihessNumber coco::atan (const ihessNumber & *a*)

Definition at line 283 of file ihessNumber.cc.

9.1.4.34 diffNumber coco::atan (const diffNumber & *a*)

Definition at line 398 of file diffNumber.cc.

9.1.4.35 interval coco::atan (const interval & *x*)

Returns an interval enclosure of the inverse tangent of the interval x.

9.1.4.36 diffI coco::atan (const diffI & *a*)

Definition at line 890 of file diffI.cc.

9.1.4.37 template<class I > projective_interval<I> coco::atan (const projective_interval< I > & *x*)

Definition at line 932 of file prointerval.hpp.

9.1.4.38 interval_set coco::atan (const interval_set & *a*)

Definition at line 943 of file interval_set.cc.

9.1.4.39 hessNumber coco::atan2 (const hessNumber & *a,* const hessNumber & *b*)

Definition at line 213 of file hessNumber.cc.

9.1.4.40 ihessNumber coco::atan2 (const ihessNumber & *a,* const ihessNumber & *b*)

Definition at line 266 of file ihessNumber.cc.

9.1.4.41 diffNumber coco::atan2 (const diffNumber & *a,* const diffNumber & *b*)

Definition at line 381 of file diffNumber.cc.

9.1.4.42 interval coco::atan2 (const interval & *y,* const interval & *x*) [inline]

This function computes the atan2 function $\mathrm{atan}(y/x)$ for intervals.

Definition at line 777 of file interval_boost.h.

9.1.4.43 diffI coco::atan2 (const diffI & *a,* const diffI & *b*)

Definition at line 867 of file diffI.cc.

9.1.4.44 interval_set coco::atan2 (const interval_set & *a,* const interval_set & *b*)

Definition at line 1066 of file interval_set.cc.

9.1.4.45 template<class I > projective_interval<I> coco::atan2 (const projective_interval< I > & *x,* const projective_interval< I > & *y*)

Definition at line 1151 of file prointerval.hpp.

9.1.4.46 interval coco::atanh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

9.1.4.47 template<class I > projective_interval<I> coco::atanh (const projective_interval< I > & *x*)

Definition at line 941 of file prointerval.hpp.

9.1.4.48 interval_set coco::atanh (const interval_set & *a*)

Definition at line 1039 of file interval_set.cc.

9.1.4.49 const basic_alltype & coco::coco::basic_alltype_empty ( )

Definition at line 44 of file basic_alltype.cc.

9.1.4.50 interval coco::cancel (const interval & *a*, const interval & *b*)

9.1.4.51 hessNumber coco::cos (const hessNumber & *a*)

Definition at line 92 of file hessNumber.cc.

9.1.4.52 ihessNumber coco::cos (const ihessNumber & *a*)

Definition at line 107 of file ihessNumber.cc.

9.1.4.53 diffNumber coco::cos (const diffNumber & *a*)

Definition at line 111 of file diffNumber.cc.

9.1.4.54 diffI coco::cos (const diffI & *a*)

Definition at line 629 of file diffI.cc.

9.1.4.55 interval coco::cos (const interval & *x*)

Returns an interval enclosure of the cosine of the interval x.

9.1.4.56 interval_set coco::cos (const interval_set & *a*)

Definition at line 871 of file interval_set.cc.

9.1.4.57 template<class I > projective_interval<I> coco::cos (const projective_interval< I > & *x*)

Definition at line 950 of file prointerval.hpp.

9.1.4.58 hessNumber coco::cosh (const hessNumber & *a*)

Definition at line 201 of file hessNumber.cc.

9.1.4.59 ihessNumber coco::cosh (const ihessNumber & *a*)

Definition at line 254 of file ihessNumber.cc.

9.1.4.60 diffNumber coco::cosh (const diffNumber & *a*)

Definition at line 366 of file diffNumber.cc.

9.1.4.61 interval coco::cosh (const interval & *x*)

Returns an interval enclosure of the hyperbolic cosine of the interval x.

9.1.4.62 diffI coco::cosh (const diffI & *a*)

Definition at line 846 of file diffI.cc.

9.1.4.63 template<class I > projective_interval<I> coco::cosh (const projective_interval< I > & *x*)

Definition at line 959 of file prointerval.hpp.

9.1.4.64 interval_set coco::cosh (const interval_set & *a*)

Definition at line 967 of file interval_set.cc.

9.1.4.65 interval coco::cot (const interval & *x*)

Returns an interval enclosure of the cotangent of the interval x.

9.1.4.66 interval_set coco::cot (const interval_set & *a*)

Definition at line 883 of file interval_set.cc.

9.1.4.67 template<class I > projective_interval<I> coco::cot (const projective_interval< I > & *x*)

Definition at line 968 of file prointerval.hpp.

9.1.4.68 interval coco::coth (const interval & *x*)

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

9.1.4.69 template<class I > projective_interval<I> coco::coth (const projective_interval< I > & *x*)

Definition at line 977 of file prointerval.hpp.

9.1.4.70 interval_set coco::coth (const interval_set & *a*)

Definition at line 979 of file interval_set.cc.

9.1.4.71 std::string coco::datetime (const struct tm * *timeptr*)

This function returns the local time as C++ string.

Definition at line 46 of file writer_utils.cc.

9.1.4.72 template<typename _TR > _TR coco::dbccmps_abs (const _TR & *x*)

Definition at line 118 of file dbcompare.hpp.

9.1.4.73 double coco::diam (const interval &)

diam(a) == a.diam()

9.1.4.74 double coco::dist (const interval & *x*, const interval & *y*)

Same as x.dist(y)

9.1.4.75 interval_set coco::divide (const interval & *a*, double *b*) [inline]

Definition at line 449 of file interval_set.h.

9.1.4.76 interval_set coco::divide (double *a*, const interval & *b*) [inline]

Definition at line 453 of file interval_set.h.

9.1.4.77 interval_set coco::divide (const interval & *a,* const interval & *b*)

Definition at line 660 of file interval_set.cc.

9.1.4.78 interval coco::division_part1 (const interval & *x,* const interval & *y,* bool & *b*)

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

9.1.4.79 template<class I > projective_interval<I> coco::division_part1 (const projective_interval< I > & *x,* const projective_interval< I > & *y,* bool & *b*)

Definition at line 1161 of file prointerval.hpp.

9.1.4.80 interval coco::division_part2 (const interval & *x,* const interval & *y,* bool *b* = `true`)

9.1.4.81 template<class I > projective_interval<I> coco::division_part2 (const projective_interval< I > & *x,* const projective_interval< I > & *y,* bool *b*)

Definition at line 1171 of file prointerval.hpp.

9.1.4.82 double coco::downward_divides (const double & *a,* const double & *b*)

This function divides `a` by `b`, rounding downwards.

9.1.4.83 double coco::downward_minus (const double & *a,* const double & *b*)

This function subtracts `b` from `a`, rounding downwards.

9.1.4.84 double coco::downward_multiplies (const double & *a,* const double & *b*)

This function multiplies `a` by `b`, rounding downwards.

9.1.4.85 double coco::downward_plus (const double & *a,* const double & *b*)

This function adds `a` and `b`, rounding downwards.

9.1.4.86 std::string coco::e2D (double *d*)

This function converts a double number to a double precision Fortran representation in a C++ string.

Definition at line 78 of file writer_utils.cc.

9.1.4.87 bool coco::eval (const vdbl::rowid & *rid,* const std::string & *colname,* dbc_method *tp,* vdbl::view * *iv,* const basic_alltype & *cmpval*)

Definition at line 312 of file dbcompare.cc.

9.1.4.88 interval coco::eval_asqr (const interval & *x1,* const interval & *x2,* const interval & *x3*) [inline]

Evaluate the optimal range for an ASQR node.

Definition at line 68 of file asqr.h.

9.1.4.89 template<typename _TR > bool coco::eval_in (const vdbl::rowid & *rid,* const std::string & *colname,* dbc_method *tp,* vdbl::view * *iv,* _TR , const basic_alltype & *l*)

Definition at line 39 of file dbcompare.cc.

9.1.4.90 template<> bool coco::eval_in< interval > (const vdbl::rowid & *rid,* const std::string & *colname,* dbc_method *tp,* vdbl::view * *iv,* interval , const basic_alltype & *l*)

Definition at line 86 of file dbcompare.cc.

9.1.4.91 template<> bool coco::eval_in< std::string > (const vdbl::rowid & *rid,* const std::string & *colname,* dbc_method *tp,* vdbl::view * *iv,* std::string , const basic_alltype & *l*)

Definition at line 106 of file dbcompare.cc.

Definition at line 239 of file dbcompare.hpp.

9.1.4.114 template<typename _TR , typename _AT > std::vector<std::pair<vdbl::rowid,_AT> >::iterator coco::filter_u (typename std::vector< std::pair< vdbl::rowid, _AT > > & *rid,* typename std::vector< std::pair< vdbl::rowid, _AT > >::iterator *rid_b,* const std::string & *colname,* dbc_method *tp,* vdbl::view * *iv,* unsigned int *n,* _TR)

Definition at line 326 of file dbcompare.hpp.

9.1.4.115 interval coco::flb (const interval & *x1,* const interval & *x2,* const interval & *x3*) [inline]

Evaluate f(x1,x2,x3) = (x3-x2+x1)^2 + 4*x1*x2 with interval arguments. This is actually used with point intervals to get proper lower and upper bounds at the extremal points.

Definition at line 40 of file asqr.h.

9.1.4.116 double coco::gainfactor (const interval & *_old,* const interval & *_new*) [inline]

The call `gainfactor(o,n)` computes a safeguarded quotient of the widths of @ o and @ n under the assumption that `n` is a subset of `o`.

Definition at line 799 of file interval_boost.h.

9.1.4.117 interval coco::gauss (const interval & *x*) [inline]

This function computes the gaussian function e^{-x^2} for intervals.

Definition at line 770 of file interval_boost.h.

9.1.4.118 bool coco::get_children_vector (const search_graph & *__sgraph,* const search_node_id & *pid,* std::vector< si_ri_pair > & *v,* search_inspector * *sfoc*)

Definition at line 59 of file search_graph_funcs.cc.

9.1.4.119 std::string coco::get_diff_class (int *i*)

Definition at line 37 of file diff_info.cc.

9.1.4.120 void coco::get_ids (const std::vector< si_ri_pair > & *riv,* std::vector< search_node_id > & *v*)

Definition at line 34 of file search_graph_funcs.cc.

9.1.4.121 termination_reason coco::get_locopt_termr_from_rval (const locopt_ret & *ret_info,* const std::string & *iename,* const int *srval*)

Definition at line 49 of file locopt_ret.cc.

9.1.4.122 double coco::get_locopt_weight_from_rval (const locopt_ret & *ret_info,* const std::string & *iename,* const int *srval*)

Definition at line 34 of file locopt_ret.cc.

9.1.4.123 tableid coco::get_point_table (database * *ptr,* standard_table *& *ptb,* userid *_uid*)

Definition at line 41 of file dbtables.cc.

9.1.4.124 void coco::hess_star_color1 (const unsigned int *n,* const vmtl::sparse_matrix< int > & *H,* std::vector< std::vector< unsigned int > > & *parts,* std::vector< vmtl::sparse_vector< unsigned int > > & *provides*)

Definition at line 35 of file hess_color.cc.

9.1.4.125 interval coco::hull (const interval & *__x,* const interval & *__y*) [inline]

Definition at line 1006 of file interval_filib.h.

9.1.4.126 interval coco::hulldiff (const interval & *__x,* const interval & *__y*) [inline]

Definition at line 1012 of file interval_filib.h.

9.1.4.127 std::string coco::i2a (int *x*)

This function converts integers to a C++ string.

Definition at line 37 of file writer_utils.cc.

9.1.4.128 interval_set coco::imax (const interval_set & *a,* const interval_set & *b*)

Definition at line 700 of file interval_set.cc.

9.1.4.129 interval coco::imax (const interval & *x,* const interval & *y*)

Returns an interval enclosure of the maximum of two intervals x and y.

9.1.4.130 template<class I > projective_interval<I> coco::imax (const projective_interval< I > & *x,* const projective_interval< I > & *y*)

Definition at line 1133 of file prointerval.hpp.

9.1.4.131 interval_set coco::imin (const interval_set & *a*, const interval_set & *b*)

Definition at line 685 of file interval_set.cc.

9.1.4.132 interval coco::imin (const interval & *x*, const interval & *y*)

Returns an interval enclosure of the minimum of two intervals x and y.

9.1.4.133 template<class I > projective_interval<I> coco::imin (const projective_interval< I > & *x*, const projective_interval< I > & *y*)

Definition at line 1142 of file prointerval.hpp.

9.1.4.134 interval coco::intersect (const interval & *__x*, const interval & *__y*) [inline]

Definition at line 1000 of file interval_filib.h.

9.1.4.135 interval_set coco::intersect_inv_hlp (d1func * *d1help*, const interval & *xx*, const interval_set & *r*, int *order*) [inline]

Definition at line 176 of file dagd1func_bp.cc.

9.1.4.136 interval coco::ipow (const interval & *x*, int *n*) [inline]

This function computes the integer power operation x^n for intervals.

Definition at line 763 of file interval_boost.h.

9.1.4.137 bool coco::less_equal (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

Definition at line 557 of file basic_alltype.cc.

9.1.4.138 bool coco::less_than (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

Definition at line 555 of file basic_alltype.cc.

9.1.4.139 bool coco::lexicographic_le (const interval & *a*, const interval & *b*) [inline]

This comparison operator returns the "lexicographically less than or equal to interval relation", i.e. it is true iff `lexicographic_le(T, X) == T.inf() < X.inf() || (T.inf() == X.inf() && T.sup() <= X.sup())` .

Definition at line 696 of file interval_filib.h.

9.1.4.140 bool coco::lexicographic_lt (const interval & *a*, const interval & *b*) [inline]

This comparison operator returns the "lexicographically less than interval relation", i.e. it is true iff `lexicographic_lt(T, X) == T.inf() < X.inf() || (T.inf() == X.inf() && T.sup() < X.sup())` .

Definition at line 688 of file interval_filib.h.

9.1.4.141 template<typename _AT > void coco::list_from_view (typename std::vector< std::pair< vdbl::rowid, _AT > > & *riv,* vdbl::view * *iv,* const std::map< int, std::triple< std::string, dbc_method, basic_alltype > > & *cols,* const std::vector< int > & *sort,* unsigned int *n* = 1)

Definition at line 441 of file dbcompare.hpp.

9.1.4.142 std::string coco::localdatetime ( )

This function converts a date/time structure to a C++ string.

Definition at line 68 of file writer_utils.cc.

9.1.4.143 hessNumber coco::log (const hessNumber & *a*)

Definition at line 179 of file hessNumber.cc.

9.1.4.144 ihessNumber coco::log (const ihessNumber & *a*)

Definition at line 232 of file ihessNumber.cc.

9.1.4.145 diffNumber coco::log (const diffNumber & *a*)

Definition at line 338 of file diffNumber.cc.

9.1.4.146 interval coco::log (const interval & *x*)

Returns an interval enclosure of the natural logarithm of the interval x.

9.1.4.147 interval_set coco::log (const interval_set & *a*)

Definition at line 799 of file interval_set.cc.

9.1.4.148 diffI coco::log (const diffI & *a*)

Definition at line 806 of file diffI.cc.

9.1.4.149 template<class I > projective_interval<I> coco::log (const projective_interval< I > & *x*)

Definition at line 1022 of file prointerval.hpp.

9.1.4.150 interval coco::log10 (const interval & *x*)

Returns an interval enclosure of the logarithm (base 10) of the interval x.

9.1.4.151 interval_set coco::log10 (const interval_set & *a*)

Definition at line 811 of file interval_set.cc.

9.1.4.222 interval_set coco::operator+ (double *a*, const interval_set & *b*) [inline]

Definition at line 361 of file interval_set.h.

9.1.4.223 diffI coco::operator+ (const diffI & *a*, const diffI & *b*)

Definition at line 162 of file diffI.cc.

9.1.4.224 diffI coco::operator+ (const double & *a*, const diffI & *b*)

Definition at line 181 of file diffI.cc.

9.1.4.225 diffI coco::operator+ (const diffI & *a*, const double & *b*)

Definition at line 195 of file diffI.cc.

9.1.4.226 diffI coco::operator+ (const interval & *a*, const diffI & *b*)

Definition at line 209 of file diffI.cc.

9.1.4.227 diffI coco::operator+ (const diffI & *a*, const interval & *b*)

Definition at line 223 of file diffI.cc.

9.1.4.228 work_node coco::operator+ (const work_node & *_w*, const delta_id & *_i*) [inline]

This function adds the delta with delta_id `_i` to work_node `_w` and returns a new work_node having the delta applied.

Definition at line 298 of file search_node.hpp.

9.1.4.229 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node coco::operator+ (const work_node & _w, const _Ctr< delta_id, _Al > & _d) [inline]

This function adds all the deltas whose delta_ids are in the linear container _d to work_node _w and returns a new work_node having all these deltas applied.

Definition at line 325 of file search_node.hpp.

9.1.4.230 interval coco::operator+ (const interval & *a*, const interval & *b*)

This operator computes a+b as interval.

9.1.4.231 interval coco::operator+ (const interval & *a*, double *b*)

9.1.4.232 interval coco::operator+ (double *b*, const interval & *a*)

9.1.4.233 template<class I > projective_interval<I> coco::operator+ (const projective_interval< I > & *a*, const projective_interval< I > & *b*)

Definition at line 702 of file prointerval.hpp.

9.1.4.234 template<class I > projective_interval<I> coco::operator+ (const projective_interval< I > & *a*, double *b*)

Definition at line 722 of file prointerval.hpp.

9.1.4.235 template<class I > projective_interval<I> coco::operator+ (double *b*, const projective_interval< I > & *a*)

Definition at line 741 of file prointerval.hpp.

9.1.4.236 work_node& coco::operator+= (work_node & _w, const delta_id & _i) [inline]

This function adds the delta with delta_id _i to work_node _w changing it in that process. The function returns _w.

Definition at line 311 of file search_node.hpp.

9.1.4.237 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node& coco::operator+= (work_node & _w, const _Ctr< delta_id, _Al > & _d) [inline]

This function adds the deltas whose delta_ids are in the linear container _d to work_node _w changing it in that process. The function returns _w.

Definition at line 341 of file search_node.hpp.

9.1.4.238 work_node coco::operator- (const work_node & _w, const delta_id & _d)

This function removes the delta with delta_id _i from work_node _w and returns a new work_node having the delta unapplied.

Definition at line 39 of file search_node.cc.

9.1.4.239 diffNumber coco::operator- (const diffNumber & *a,* const diffNumber & *b*) [inline]

Definition at line 213 of file diffNumber.h.

9.1.4.240 diffNumber coco::operator- (const double & *a,* const diffNumber & *b*) [inline]

Definition at line 226 of file diffNumber.h.

9.1.4.367 template<class I > projective_interval<I> coco::sinh (const projective_interval< I > & *x*)

Definition at line 1088 of file prointerval.hpp.

9.1.4.368 void coco::sparsity (const model & *DAG*, int & *nnz_H*, int *& *H_ridx*, int *& *H_cidx*, int & *nnz_J*, int *& *J_funidx*, int *& *J_varidx*, bool *J_with_obj*, bool *J_obj_is_first*, bool *org_only*, bool *H_upper_only*, sp_indexing *indexing*, bool *fun_one_based*, bool *var_one_based*)

Definition at line 712 of file sparsity.cc.

9.1.4.369 void coco::sparsity (const model & *DAG*, unsigned int & *nnz_H*, unsigned int *& *H_ridx*, unsigned int *& *H_cidx*, bool *org_only*, bool *H_upper_only*, sp_indexing *indexing*, bool *fun_one_based*, bool *var_one_based*)

Definition at line 725 of file sparsity.cc.

9.1.4.370 void coco::sparsity (const model & *DAG*, int & *nnz_J*, int *& *J_funidx*, int *& *J_varidx*, bool *J_with_obj*, bool *J_obj_is_first*, bool *org_only*, sp_indexing *indexing*, bool *fun_one_based*, bool *var_one_based*)

Definition at line 780 of file sparsity.cc.

9.1.4.371 ihessNumber coco::sqr (const ihessNumber & *a*)

Definition at line 294 of file ihessNumber.cc.

9.1.4.372 interval coco::sqr (const interval & *x*)

Returns an interval enclosure of x^2.

9.1.4.373 interval_set coco::sqr (const interval_set & *a*)

Definition at line 727 of file interval_set.cc.

9.1.4.374 diffI coco::sqr (const diffI & *a*)

Definition at line 911 of file diffI.cc.

9.1.4.375 template<class I > projective_interval<I> coco::sqr (const projective_interval< I > & *x*)

Definition at line 1097 of file prointerval.hpp.

9.1.4.376 hessNumber coco::sqrt (const hessNumber & *a*)

Definition at line 104 of file hessNumber.cc.

9.1.4.377 ihessNumber coco::sqrt (const ihessNumber & *a*)

Definition at line 119 of file ihessNumber.cc.

9.1.4.378 diffNumber coco::sqrt (const diffNumber & *a*)

Definition at line 126 of file diffNumber.cc.

9.1.4.379 diffI coco::sqrt (const diffI & *a*)

Definition at line 656 of file diffI.cc.

9.1.4.380 interval coco::sqrt (const interval & *x*)

Returns an interval enclosure of the square root of the interval x.

9.1.4.381 interval_set coco::sqrt (const interval_set & *a*)

Definition at line 739 of file interval_set.cc.

9.1.4.382 template<class I > projective_interval<I> coco::sqrt (const projective_interval< I > & *x*)

Definition at line 1106 of file prointerval.hpp.

9.1.4.383 hessNumber coco::square (const hessNumber & *a*)

Definition at line 242 of file hessNumber.cc.

9.1.4.384 diffNumber coco::square (const diffNumber & *a*)

Definition at line 414 of file diffNumber.cc.

9.1.4.385 std::vector<std::vector<void *> > coco::standard_evaluators (NUM_EVALUATORS)

This variables contains pointers to all standard evaluation routines for user defined nodes.

9.1.4.386 interval coco::tan (const interval & *x*)

Returns an interval enclosure of the tangent of the interval x.

9.1.4.387 interval_set coco::tan (const interval_set & *a*)

Definition at line 895 of file interval_set.cc.

9.1.4.388 template<class I > projective_interval<I> coco::tan (const projective_interval< I > & *x*)

Definition at line 1115 of file prointerval.hpp.

9.1.4.389 interval coco::tanh (const interval & *x*)

Returns an interval enclosure of the hyperbolic tangent of the interval x.

9.1.4.390 interval_set coco::tanh (const interval_set & *a*)

Definition at line 991 of file interval_set.cc.

9.1.4.391 template<class I > projective_interval<I> coco::tanh (const projective_interval< I > & *x*)

Definition at line 1124 of file prointerval.hpp.

9.1.4.392 double coco::upward_divides (const double & *a*, const double & *b*)

This function divides `a` by `b`, rounding upwards.

9.1.4.393 double coco::upward_minus (const double & *a*, const double & *b*)

This function subtracts `b` from `a`, rounding upwards.

9.1.4.394 double coco::upward_multiplies (const double & *a*, const double & *b*)

This function multiplies `a` by `b`, rounding upwards.

9.1.4.395 double coco::upward_plus (const double & *a*, const double & *b*)

This function adds `a` and `b`, rounding upwards.

9.1.4.396 double coco::volume (const interval_set & *a*)

Definition at line 657 of file interval_set.cc.

9.1.4.397 double coco::width (const interval &)

9.1.4.398 double coco::width (const interval_set & *a*)

Definition at line 656 of file interval_set.cc.

9.1.5 Variable Documentation

9.1.5.1 const char* coco::correxpr_names[ ] = {"log10", "asin", "acos", "atan", "tan", "<=", "<", ">=", ">", "==", "!="}

Definition at line 662 of file model.cc.

9.1.5.2 std::vector<std::vector<void *> > coco::standard_evaluators

9.1.5.3 const int coco::STANDARD_MAXDEG_DIFFINTERVAL = 4

Definition at line 12 of file diffI.h.

9.1.5.4 const int coco::STANDARD_MAXDEG_DIFFNUMBER = 4

Definition at line 12 of file diffNumber.h.

9.2 coco::coco Namespace Reference

Namespaces

- namespace coco
- namespace num

Classes

- struct checking_my
- struct my_rounded_math
- struct interval_st
- class interval
- class api_exception

  API exception class.
- class nyi_exception

  Not Yet Implemented exception class.
- class basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class certificate

  The certificate class (certifies deltas for rigorous mode operation)

- class certificate_base

  Base class for the certificates.
- class delta

  The delta class (updates to work nodes)
- class delta_base

  Base class for the deltas.
- class undelta

  The undelta class (undo of updates to work nodes)
- class undelta_base

  Base class for the undeltas.
- class convex_e

  Convexity information.
- class semantics

  Expression Semantics.
- class variable_indicator

  Bitmap class used to indicate variable occurrence.
- class _evaluator_base

  Base class of all evaluators.
- class evaluator_base

  Base class of all (non-caching) evaluators.
- class cached_evaluator_base

  Base class of all caching evaluators.
- class forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class backward_evaluator_base

  Base class of all (non-caching) backward evaluators.
- class cached_forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class cached_backward_evaluator_base

  Base class of all caching backward evaluators.
- class expression_node

  The base class for a node in the expression DAGs.
- class annotation

  Annotations for Models.
- class model

  The model class (an attributed DAG of expression nodes, lowest class in the model hierarchy)
- class model_iddata

  The model id-data class (the topmost in the model class hierarchy)
- class model_gid

  Model Group Data Class (middle class in the model hierarchy)
- class datamap

  The base class for communicating with COCONUT modules.
- class inference_module_cache_autogen

  Inference module cache auto-generate method base class.
- class inference_module_cache

  Inference module cache class.

- class search_node

  Base type of the nodes in the search graph.
- class delta_node

  Class holding the delta nodes in the search graph.
- class full_node

  Class holding the full nodes in the search graph.
- class work_node

  Work node, which is passed to the inference engines.
- class dbt_row

  This type is used to hold one row in some table of the search database.
- class work_node_context

  The evaluation context when retrieving from the search database.
- class point_check_feasibility

  Stored procedure checking the feasibility of a point.
- class box_check_intersection

  Stored procedure checking whether a box intersects the work_node's box.
- class delta_get_action

  Stored procedure class for computing the delta action specifier.

Typedefs

- typedef boost::numeric::interval_lib::policies < my_rounded_math< double > , checking_my< double >> my_policies
- typedef vdbl::rowid delta_id

  The class for delta ids.
- typedef enum coco::coco::tristate_e tristate
- typedef uint32_t search_node_id

  Type of the unique search node identifier.
- typedef interval rhs_t
- typedef std::vector< void * > evaluator_v
- typedef model::walker expression_walker

  Walker to the expression DAG.
- typedef model::const_walker expression_const_walker

  Const walker to the expression DAG.

  Fortran real as C++ string.
- const basic_alltype & basic_alltype_empty ()
- std::ostream & operator<< (std::ostream &os, const basic_alltype &b)
- bool less_than (const basic_alltype &a, const basic_alltype &b)
- bool less_equal (const basic_alltype &a, const basic_alltype &b)
- std::ostream & operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.
- std::ostream & operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.
- bool operator== (const convex_e &__c, const convex_e &__d)

  Equality comparison operator.
- bool operator== (const convex_e &__c, const convex_info &__d)
- bool operator== (const convex_info &__c, const convex_e &__d)
- bool operator!= (const convex_e &__c, const convex_e &__d)

  Disequality comparison operator.

- bool operator!= (const convex_e &__c, const convex_info &__d)
- bool operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & operator<< (std::ostream &o, const convex_e &__s)

  C++ stream output operator for convex_e.
- std::ostream & operator<< (std::ostream &o, const semantics &__s)

  C++ stream output operator for semantics.

- bool operator== (const interval &a, const interval &b)

- bool operator!= (const interval &a, const interval &b)

- bool operator< (const interval &a, const interval &b)

- interval operator+ (const interval &a, const interval &b)

- interval operator- (const interval &a, const interval &b)

- interval operator* (const interval &a, const interval &b)

- interval operator/ (const interval &a, const interval &b)

- interval division_part1 (const interval &x, const interval &y, bool &b)

9.2.1 Typedef Documentation

9.2.1.1 typedef std::vector<void*> coco::coco::evaluator_v

This type defines the type of the standard evaluators for user defined nodes.

Definition at line 462 of file search_graph.cc.

9.2.1.2 typedef boost::numeric::interval_lib::policies< my_rounded_math<double>, checking_my<double>> coco::coco::my_policies

Definition at line 101 of file expression.h.

9.2.1.3 typedef interval coco::coco::rhs_t

This type is the allowed type for constraint restrictions.

Definition at line 459 of file search_graph.cc.

9.2.1.4 typedef enum coco::coco::tristate_e coco::coco::tristate

The tristate type is a boolean with the addition of a maybe value

9.2.2 Enumeration Type Documentation

9.2.2.1 enum coco::coco::activity_descr

This enum describes the activity state known about a constraint and whether it is redundant or not. The meaning of the enum entries is:

- `a_redundant`: The constraint is known to be redundant. There can be two reasons for that. It can be inactive on both sides, or it was constructed, knowing that it would be redundant (e.g. cuts).
- `a_active_lo`: The `work_node` may contain points, for which this constraint is active at the lower bound but no points, for which the constraint is active at the upper bound.
- `a_active_hi`: The `work_node` may contain points, for which this constraint is active at the upper bound but no points, for which the constraint is active at the lower bound.
- `a_active`: The `work_node` may contain points, for which this constraint is active at the upper bound and points, for which the constraint is active at the lower bound.
- ..._red: A combination with `_red` means that although the inactivity of the constraint could not be proved, it is still known to be redundant.

Enumerator:

a_redundant

a_active_lo

a_active_lo_red

a_active_hi

a_active_hi_red

a_active

a_active_red

Definition at line 81 of file search_graph.cc.

9.2.2.2 enum coco::coco::convex_info

This enum is used to store information about the convexity of a node or an expression.

Enumerator:

c_convex The expression is convex and not linear

c_linear The expression is linear

c_concave The expression is concave and not linear

c_maybe The convexity type of the expression is unknown

c_not The expression is neither convex nor concave

c_constant The expression is constant

Definition at line 45 of file search_graph.cc.

9.2.2.3 enum coco::coco::e_expression_type

This enum is used for determining the type of the expression in the `is` method and similar methods and operators

Enumerator:

ex_bound a variable

ex_linear linear (but not a single variable)

ex_quadratic quadratic non-linear

ex_polynomial non-quadratic polynomial

ex_other non-polynomial non-linear

ex_kj only additional vars, constr. from KJ-conditions

ex_org original vars, constr. (ex_kj, ex_org both set = none set)

ex_redundant this constraint is known to be redundant

ex_notredundant this constraint is known to be not redundant

ex_active_lo this constraint is possible active at the lower bound

ex_inactive_lo this constraint is inactive at the lower bound

ex_active_hi this constraint is possible active at the upper bound

ex_inactive_hi this constraint is inactive at the upper bound

ex_active this constraint is possible active

ex_inactive this constraint is inactive

ex_integer this expression is an integer expression

ex_exists this variable has an exist-context

ex_forall this variable has a for-all-context

ex_free this variable is free

ex_stochastic this variable is a stochastic variable

ex_convex this expression is known to be convex

ex_concave this expression is known to be concave

ex_inequality this is an inequality constraint

ex_equality this is an equality constraint

ex_leftbound this is a constraint with lower bound

ex_rightbound this is a constraint with upper bound

ex_atmlin at most linear

ex_atmquad at most quadratic

ex_atmpoly at most polynomial

ex_nonlin non linear
ex_nonbnd not bounds
ex_any any
ex_bothbound this is a two-sided constraint

Definition at line 402 of file search_graph.cc.

9.2.2.4 enum coco::coco::tristate_e

The tristate type is a boolean with the addition of a maybe value

Enumerator:

t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe

Definition at line 37 of file search_graph.cc.

9.2.2.5 enum coco::coco::tristate_e

The tristate type is a boolean with the addition of a maybe value

Enumerator:

t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe

Definition at line 37 of file search_graph.cc.

9.2.2.6 enum coco::coco::tristate_e

The tristate type is a boolean with the addition of a maybe value

Enumerator:

t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe

Definition at line 37 of file search_graph.cc.

9.2.2.7 enum coco::coco::tristate_e

The tristate type is a boolean with the addition of a maybe value

Enumerator:

t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe
t_true
t_false
t_maybe

Definition at line 37 of file search_graph.cc.

9.2.2.8 enum coco::coco::type_annotation

This enum is used to store information about the type of a node or an expression.

Enumerator:

v_exists The expression/variable is interpreted in a exists context.
v_forall The expression/variable is interpreted in a forall context.
v_free This is valid for variables only, and it defines a free variable.
v_stochastic This expression is stochastic.

Definition at line 46 of file search_graph.cc.

9.2.3 Function Documentation

9.2.3.1 interval coco::coco::abs (const interval & *x*)

Returns an interval enclosure of the absolute value of the interval x.

9.2.3.2 double coco::coco::absmin (const interval & *__i*) [inline]

This function returns the element of `__i` with smallest absolute value.

Definition at line 785 of file expression.h.

9.2.3.3 interval coco::coco::acos (const interval & *x*)

Returns an interval enclosure of the inverse cosine of the interval x.

9.2.3.4 interval coco::coco::acosh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

9.2.3.5 interval coco::coco::acot (const interval & *x*)

Returns an interval enclosure of the inverse cotangent of the interval x.

9.2.3.6 interval coco::coco::acoth (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

9.2.3.7 interval coco::coco::asin (const interval & *x*)

Returns an interval enclosure of the inverse sine of the interval x.

9.2.3.8 interval coco::coco::asinh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

9.2.3.9 interval coco::coco::atan (const interval & *x*)

Returns an interval enclosure of the inverse tangent of the interval x.

9.2.3.10 interval coco::coco::atan2 (const interval & *y*, const interval & *x*) [inline]

This function computes the atan2 function $\mathrm{atan}(y/x)$ for intervals.

Definition at line 778 of file expression.h.

9.2.3.11 interval coco::coco::atanh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

9.2.3.12 const basic_alltype& coco::coco::basic_alltype_empty ( )

Definition at line 44 of file basic_alltype.cc.

9.2.3.13 interval coco::coco::cancel (const interval & *a*, const interval & *b*)

9.2.3.14 interval coco::coco::cos (const interval & *x*)

Returns an interval enclosure of the cosine of the interval x.

9.2.3.15 interval coco::coco::cosh (const interval & *x*)

Returns an interval enclosure of the hyperbolic cosine of the interval x.

9.2.3.16 interval coco::coco::cot (const interval & *x*)

Returns an interval enclosure of the cotangent of the interval x.

9.2.3.17 interval coco::coco::coth (const interval & *x*)

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

9.2.3.18 std::string coco::coco::datetime (const struct tm * *timeptr*)

This function returns the local time as C++ string.

Definition at line 46 of file writer_utils.cc.

9.2.3.19 double coco::coco::diam (const interval &)

diam(a) == a.diam()

9.2.3.20 double coco::coco::dist (const interval & *x*, const interval & *y*)

Same as x.dist(y)

9.2.3.21 interval coco::coco::division_part1 (const interval & *x*, const interval & *y*, bool & *b*)

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`;

a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

9.2.3.22 interval coco::coco::division_part2 (const interval & *x*, const interval & *y*, bool *b* = `true`)

9.2.3.23 std::string coco::coco::e2D (double *d*)

This function converts a double number to a double precision Fortran representation in a C++ string.

Definition at line 78 of file writer_utils.cc.

9.2.3.24 interval coco::coco::exp (const interval & *x*)

Returns an interval enclosure of the exponential of the interval x.

9.2.3.25 interval coco::coco::exp10 (const interval & *x*)

Returns an interval enclosure of the exponential (base 10) of the interval x.

9.2.3.26 interval coco::coco::exp2 (const interval & *x*)

Returns an interval enclosure of the exponential (base 2) of the interval x.

9.2.3.27 interval coco::coco::expm1 (const interval & *x*)

Returns an interval enclosure of exp(x)-1

9.2.3.28 double coco::coco::gainfactor (const interval & *_old*, const interval & *_new*) `[inline]`

The call `gainfactor(o,n)` computes a safeguarded quotient of the widths of @ o and @ n under the assumption that `n` is a subset of `o`.

Definition at line 800 of file expression.h.

9.2.3.29 interval coco::coco::gauss (const interval & *x*) `[inline]`

This function computes the gaussian function e^{-x^2} for intervals.

Definition at line 771 of file expression.h.

9.2.3.30 std::string coco::coco::i2a (int *x*)

This function converts integers to a C++ string.

Definition at line 37 of file writer_utils.cc.

9.2.3.31 interval coco::coco::imax (const interval & *x*, const interval & *y*)

Returns an interval enclosure of the maximum of two intervals x and y.

9.2.3.32 interval coco::coco::imin (const interval & *x*, const interval & *y*)

Returns an interval enclosure of the minimum of two intervals x and y.

9.2.3.33 interval coco::coco::ipow (const interval & *x*, int *n*) [inline]

This function computes the integer power operation x^n for intervals.

Definition at line 764 of file expression.h.

9.2.3.34 bool coco::coco::less_equal (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

9.2.3.35 bool coco::coco::less_than (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

9.2.3.36 std::string coco::coco::localdatetime ( )

This function converts a date/time structure to a C++ string.

Definition at line 68 of file writer_utils.cc.

9.2.3.37 interval coco::coco::log (const interval & *x*)

Returns an interval enclosure of the natural logarithm of the interval x.

9.2.3.38 interval coco::coco::log10 (const interval & *x*)

Returns an interval enclosure of the logarithm (base 10) of the interval x.

9.2.3.39 interval coco::coco::log1p (const interval & *x*)

Returns an interval enclosure of log(1+x).

9.2.3.40 interval coco::coco::log2 (const interval & *x*)

Returns an interval enclosure of the logarithm (base 2) of the interval x.

9.2.3.41 double coco::coco::mag (const interval &)

mag(a) == a.mag()

9.2.3.42 double coco::coco::mid (const interval &)

mid(a) == a.mid()

9.2.3.43 double coco::coco::mig (const interval &)

mig(a) == a.mig()

9.2.3.44 template<class _TC > bool coco::coco::operator!= (const interval & *__i*, const _TC & *__d*) [inline]

Definition at line 823 of file expression.h.

9.2.3.45 bool coco::coco::operator!= (const interval & __i, const interval & __d) [inline]

Comparison operator (not equal)

Definition at line 519 of file expression.h.

9.2.3.46 bool coco::coco::operator!= (const interval & a, double b) [inline]

Definition at line 521 of file expression.h.

9.2.3.47 interval coco::coco::operator∗ (const interval & a, const interval & b)

This operator computes a∗b as interval.

9.2.3.48 interval coco::coco::operator∗ (const interval & a, double b)

9.2.3.49 interval coco::coco::operator∗ (double b, const interval & a)

9.2.3.50 interval coco::coco::operator+ (const interval & a, const interval & b)

This operator computes a+b as interval.

9.2.3.51 interval coco::coco::operator+ (const interval & a, double b)

9.2.3.52 interval coco::coco::operator+ (double b, const interval & a)

9.2.3.53 interval coco::coco::operator- (const interval & a, const interval & b)

This operator computes a-b as interval.

9.2.3.54 interval coco::coco::operator- (const interval & a, double b)

9.2.3.55 interval coco::coco::operator- (double b, const interval & a)

9.2.3.56 interval coco::coco::operator/ (const interval & a, const interval & b)

This operator computes a/b as interval.

9.2.3.57 interval coco::coco::operator/ (const interval & a, double b)

9.2.3.58 interval coco::coco::operator/ (double b, const interval & a)

9.2.3.59 bool coco::coco::operator< (const interval & a, const interval & b) [inline]

This comparison operator returns the "surely less than interval relation", i.e. it is true iff `T < X == T.sup() < X.inf()`.

This comparison operator returns the "sure less than interval relation", i.e. it is true iff `T.sgt(X) == T.inf() > X.inf() && T.sup() > X.sup()`.

Definition at line 523 of file expression.h.

9.2.3.60 bool coco::coco::operator< (const interval & *a*, double *b*) [inline]

Definition at line 524 of file expression.h.

9.2.3.61 bool coco::coco::operator< (double *a*, const interval & *b*) [inline]

Definition at line 525 of file expression.h.

9.2.3.62 std::ostream & coco::coco::operator<< (std::ostream & *s*, const interval & *a*) [inline]

Definition at line 1070 of file interval_filib.h.

9.2.3.63 std::ostream & coco::coco::operator<< (std::ostream & *os*, const basic_alltype & *b*)

9.2.3.64 template<class _TC > bool coco::coco::operator== (const interval & *__i*, const _TC & *__d*) [inline]

Definition at line 815 of file expression.h.

9.2.3.65 bool coco::coco::operator== (const interval & *__i*, const interval & *__d*) [inline]

friends

Comparison operator (equal)

Definition at line 515 of file expression.h.

9.2.3.66 bool coco::coco::operator== (const interval & *a*, double *b*) [inline]

Definition at line 517 of file expression.h.

9.2.3.67 interval coco::coco::pow (const interval & *x*, const interval & *y*)

Returns an interval enclosure of x^y = exp(y∗log(x)).

9.2.3.68 interval coco::coco::power (const interval & *x*, int *n*)

Returns an interval enclosure of x^n.

9.2.3.69 double coco::coco::rad (const interval &)

rad(a) == a.rad()

9.2.3.70 double coco::coco::relDiam (const interval &)

relDiam(a) == a.relDiam()

9.2.3.71 interval coco::coco::round_to_integer (const interval & *x*)

This function rounds the interval inward to integer borders.

9.2.3.72 double coco::coco::safeguarded_mid (const interval & __i) [inline]

This function computes the safeguarded midpoint of __i.

Definition at line 493 of file expression.h.

9.2.3.73 interval coco::coco::sin (const interval & x)

Returns an interval enclosure of the sine of the interval x.

9.2.3.74 interval coco::coco::sinh (const interval & x)

Returns an interval enclosure of the hyperbolic sine of the interval x.

9.2.3.75 interval coco::coco::sqr (const interval & x)

Returns an interval enclosure of x^2.

9.2.3.76 interval coco::coco::sqrt (const interval & x)

Returns an interval enclosure of the square root of the interval x.

9.2.3.77 interval coco::coco::tan (const interval & x)

Returns an interval enclosure of the tangent of the interval x.

9.2.3.78 interval coco::coco::tanh (const interval & x)

Returns an interval enclosure of the hyperbolic tangent of the interval x.

9.2.3.79 double coco::coco::width (const interval &)

9.3 coco::coco::coco Namespace Reference

Classes

- struct checking_my
- struct my_rounded_math
- struct interval_st
- class interval
- class api_exception

  API exception class.
- class nyi_exception

  Not Yet Implemented exception class.
- class basic_alltype

  The basic alltype which can hold any of a number of basic types.

Typedefs

- typedef boost::numeric::interval_lib::policies < my_rounded_math< double > , checking_my< double >> my_policies

Enumerations

- enum api_exception_type { apiee_internal = 1, apiee_evaluator = 2, apiee_io = 3, apiee_delta = 4, apiee_search_graph = 5, apiee_communication_data = 6, apiee_inference_engine = 7, apiee_graph_analyzer = 8, apiee_management_module = 9, apiee_initializer = 10, apiee_report_module = 11, apiee_oom = 12, apiee_nyi = 13, apiee_other = 14 }

9.3.1 Typedef Documentation

9.3.1.1 typedef boost::numeric::interval_lib::policies< my_rounded_math<double>, checking_my<double>> coco::coco::coco::my_policies

Definition at line 101 of file search_graph.cc.

9.3.2 Function Documentation

9.3.2.1 interval coco::coco::coco::abs (const interval & *x*)

Returns an interval enclosure of the absolute value of the interval x.

9.3.2.2 double coco::coco::coco::absmin (const interval & *__i*) [inline]

Definition at line 785 of file search_graph.cc.

9.3.2.3 interval coco::coco::coco::acos (const interval & *x*)

Returns an interval enclosure of the inverse cosine of the interval x.

9.3.2.4 interval coco::coco::coco::acosh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

9.3.2.5 interval coco::coco::coco::acot (const interval & *x*)

Returns an interval enclosure of the inverse cotangent of the interval x.

9.3.2.6 interval coco::coco::coco::acoth (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

9.3.2.7 interval coco::coco::coco::asin (const interval & *x*)

Returns an interval enclosure of the inverse sine of the interval x.

9.3.2.8 interval coco::coco::coco::asinh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

9.3.2.9 interval coco::coco::coco::atan (const interval & *x*)

Returns an interval enclosure of the inverse tangent of the interval x.

9.3.2.10 interval coco::coco::coco::atan2 (const interval & *y*, const interval & *x*) [inline]

Definition at line 778 of file search_graph.cc.

9.3.2.11 interval coco::coco::coco::atanh (const interval & *x*)

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

9.3.2.12 const basic_alltype& coco::coco::coco::basic_alltype_empty ( )

Definition at line 44 of file basic_alltype.cc.

9.3.2.13 interval coco::coco::coco::cancel (const interval & *a*, const interval & *b*)

9.3.2.14 interval coco::coco::coco::cos (const interval & *x*)

Returns an interval enclosure of the cosine of the interval x.

9.3.2.15 interval coco::coco::coco::cosh (const interval & *x*)

Returns an interval enclosure of the hyperbolic cosine of the interval x.

9.3.2.16 interval coco::coco::coco::cot (const interval & *x*)

Returns an interval enclosure of the cotangent of the interval x.

9.3.2.17 interval coco::coco::coco::coth (const interval & *x*)

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

9.3.2.18 std::string coco::coco::coco::datetime (const struct tm * *timeptr*)

This function returns the local time as C++ string.

Definition at line 46 of file writer_utils.cc.

9.3.2.19 double coco::coco::coco::diam (const interval &)

diam(a) == a.diam()

9.3.2.20 double coco::coco::coco::dist (const interval & *x*, const interval & *y*)

Same as x.dist(y)

9.3.2.21 interval coco::coco::coco::division_part1 (const interval & *x*, const interval & *y*, bool & *b*)

9.3.2.22 interval coco::coco::coco::division_part2 (const interval & *x*, const interval & *y*, bool *b* = `true`)

9.3.2.23 std::string coco::coco::coco::e2D (double *d*)

This function converts a double number to a double precision Fortran representation in a C++ string.

Definition at line 78 of file writer_utils.cc.

9.3.2.24 interval coco::coco::coco::exp (const interval & *x*)

Returns an interval enclosure of the exponential of the interval x.

9.3.2.25 interval coco::coco::coco::exp10 (const interval & *x*)

Returns an interval enclosure of the exponential (base 10) of the interval x.

9.3.2.26 interval coco::coco::coco::exp2 (const interval & *x*)

Returns an interval enclosure of the exponential (base 2) of the interval x.

9.3.2.27 interval coco::coco::coco::expm1 (const interval & *x*)

Returns an interval enclosure of exp(x)-1

9.3.2.28 double coco::coco::coco::gainfactor (const interval & *_old*, const interval & *_new*) [inline]

Definition at line 800 of file search_graph.cc.

9.3.2.29 interval coco::coco::coco::gauss (const interval & *x*) [inline]

Definition at line 771 of file search_graph.cc.

9.3.2.30 std::string coco::coco::coco::i2a (int *x*)

This function converts integers to a C++ string.

Definition at line 37 of file writer_utils.cc.

9.3.2.31 interval coco::coco::coco::imax (const interval & *x*, const interval & *y*)

Returns an interval enclosure of the maximum of two intervals x and y.

9.3.2.32 interval coco::coco::coco::imin (const interval & *x*, const interval & *y*)

Returns an interval enclosure of the minimum of two intervals x and y.

9.3.2.33 interval coco::coco::coco::ipow (const interval & *x*, int *n*) [inline]

Definition at line 764 of file search_graph.cc.

9.3.2.34 bool coco::coco::coco::less_equal (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

9.3.2.35 bool coco::coco::coco::less_than (const basic_alltype & *a*, const basic_alltype & *b*)

Total order comparison operator

9.3.2.36 std::string coco::coco::coco::localdatetime ( )

This function converts a date/time structure to a C++ string.

Definition at line 68 of file writer_utils.cc.

9.3.2.37 interval coco::coco::coco::log (const interval & *x*)

Returns an interval enclosure of the natural logarithm of the interval x.

9.3.2.38 interval coco::coco::coco::log10 (const interval & *x*)

Returns an interval enclosure of the logarithm (base 10) of the interval x.

9.3.2.39 interval coco::coco::coco::log1p (const interval & *x*)

Returns an interval enclosure of log(1+x).

9.3.2.40 interval coco::coco::coco::log2 (const interval & *x*)

Returns an interval enclosure of the logarithm (base 2) of the interval x.

9.3.2.41 double coco::coco::coco::mag (const interval &)

mag(a) == a.mag()

9.3.2.42 double coco::coco::coco::mid (const interval &)

mid(a) == a.mid()

9.3.2.43 double coco::coco::coco::mig (const interval &)

mig(a) == a.mig()

9.3.2.44 template<class _TC > bool coco::coco::coco::operator!= (const interval & *__i*, const _TC & *__d*) [inline]

Definition at line 823 of file search_graph.cc.

9.3.2.45 bool coco::coco::coco::operator!= (const interval & *a*, const interval & *b*) [inline]

Definition at line 519 of file search_graph.cc.

9.3.2.46 bool coco::coco::coco::operator!= (const interval & *a*, double *b*) [inline]

Definition at line 521 of file search_graph.cc.

9.3.2.47 interval coco::coco::coco::operator* (const interval & *a*, const interval & *b*)

9.3.2.48 interval coco::coco::coco::operator* (const interval & *a*, double *b*)

9.3.2.49 interval coco::coco::coco::operator* (double *b*, const interval & *a*)

9.3.2.57 interval coco::coco::coco::operator/ (const interval & *a*, double *b*)

9.3.2.58 interval coco::coco::coco::operator/ (double *b*, const interval & *a*)

9.3.2.59 bool coco::coco::coco::operator< (const interval & *a*, const interval & *b*) [inline]

Definition at line 523 of file search_graph.cc.

9.3.2.60 bool coco::coco::coco::operator< (const interval & *a*, double *b*) [inline]

Definition at line 524 of file search_graph.cc.

9.3.2.61 bool coco::coco::coco::operator< (double *a*, const interval & *b*) [inline]

Definition at line 525 of file search_graph.cc.

9.3.2.62 std::ostream & coco::coco::coco::operator<< (std::ostream & *s*, const interval & *a*)

9.3.2.63 std::ostream& coco::coco::coco::operator<< (std::ostream & *os*, const basic_alltype & *b*)

9.3.2.64 template<class _TC > bool coco::coco::coco::operator== (const interval & *__i*, const _TC & *__d*) [inline]

Definition at line 815 of file search_graph.cc.

9.3.2.65 bool coco::coco::coco::operator== (const interval & *a*, const interval & *b*) [inline]

Definition at line 515 of file search_graph.cc.

9.3.2.66 bool coco::coco::coco::operator== (const interval & *a*, double *b*) [inline]

Definition at line 517 of file search_graph.cc.

9.3.2.67 interval coco::coco::coco::pow (const interval & *x*, const interval & *y*)

Returns an interval enclosure of x^y = exp(y∗log(x)).

9.3.2.68 interval coco::coco::coco::power (const interval & *x*, int *n*)

Returns an interval enclosure of x^n.

9.3.2.69 double coco::coco::coco::rad (const interval &)

rad(a) == a.rad()

9.3.2.70 double coco::coco::coco::relDiam (const interval &)

relDiam(a) == a.relDiam()

9.3.2.71 interval coco::coco::coco::round_to_integer (const interval & *x*)

This function rounds the interval inward to integer borders.

9.3.2.72 double coco::coco::coco::safeguarded_mid (const interval & *__i*) [inline]

Definition at line 493 of file search_graph.cc.

9.3.2.73 interval coco::coco::coco::sin (const interval & *x*)

Returns an interval enclosure of the sine of the interval x.

9.3.2.74 interval coco::coco::coco::sinh (const interval & *x*)

Returns an interval enclosure of the hyperbolic sine of the interval x.

9.3.2.75 interval coco::coco::coco::sqr (const interval & *x*)

Returns an interval enclosure of x^2.

9.3.2.76 interval coco::coco::coco::sqrt (const interval & *x*)

Returns an interval enclosure of the square root of the interval x.

9.3.2.77 interval coco::coco::coco::tan (const interval & *x*)

Returns an interval enclosure of the tangent of the interval x.

9.3.2.78 interval coco::coco::coco::tanh (const interval & *x*)

Returns an interval enclosure of the hyperbolic tangent of the interval x.

9.3.2.79 double coco::coco::coco::width (const interval &)

- template<typename _RandomAccessIterator , typename _RandomAccessIteratorp , typename _Compare >
  void sort_pair_heap (_RandomAccessIterator __first, _RandomAccessIterator __last, _RandomAccessIteratorp __firstp, _RandomAccessIteratorp __lastp, _Compare __comp)
- template<class _T1 , class _T2 , class _T3 >
  bool operator== (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Two triples of the same type are equal iff their members are equal.
- template<class _T1 , class _T2 , class _T3 >
  bool operator< (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  This is lexicographic ordering of triples.
- template<class _T1 , class _T2 , class _T3 >
  bool operator!= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator==` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool operator> (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool operator<= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool operator>= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  triple< _T1, _T2, _T3 > make_triple (const _T1 &__x, const _T2 &__y, const _T3 &__z)

  A convenience wrapper for creating a triple from three objects.

9.8.1 Detailed Description

This is the standard namespace of the C++ library.

9.8.2 Enumeration Type Documentation

9.8.2.1 anonymous enum

Enumerator:

_M_p_chunk_size

Definition at line 62 of file stlp_addalgo.h.

9.8.2.2 anonymous enum

Enumerator:

_M_p_threshold

Definition at line 63 of file stlp_addalgo.h.

9.8.3 Function Documentation

9.8.3.1 template<typename _RandomAccessIterator , typename _Distance , typename _Tp , typename _RandomAccessIteratorp , typename _Distancep , typename _Tpp > void std::__adjust_pair_heap (_RandomAccessIterator *__first*, _Distance *__holeIndex*, _Distance *__len*, _Tp *__value*, _RandomAccessIteratorp *__firstp*, _Distancep *__holeIndexp*, _Distancep *__lenp*, _Tpp *__valuep*)

Definition at line 155 of file stlp_pairheap.h.

9.8.3.2 template<typename _RandomAccessIterator , typename _Distance , typename _Tp , typename _RandomAccessIteratorp , typename _Distancep , typename _Tpp , typename _Compare > void std::__adjust_pair_heap (_RandomAccessIterator *__first*, _Distance *__holeIndex*, _Distance *__len*, _Tp *__value*, _RandomAccessIteratorp *__firstp*, _Distancep *__holeIndexp*, _Distancep *__lenp*, _Tpp *__valuep*, _Compare *__comp*)

Definition at line 230 of file stlp_pairheap.h.

9.8.3.3 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Distance > void std::__chunk_insertion_p_sort (_RandomAccessIter *__first*, _RandomAccessIter *__last*, _RandomAccessIterp *__firstp*, _RandomAccessIterp *__lastp*, _Distance *__chunk_size*)

Definition at line 1178 of file stlp_addalgo.h.

9.8.3.4 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Distance , typename _Compare > void std::__chunk_insertion_p_sort (_RandomAccessIter *__first*, _RandomAccessIter *__last*, _RandomAccessIterp *__firstp*, _RandomAccessIterp *__lastp*, _Distance *__chunk_size*, _Compare *__comp*)

Definition at line 1194 of file stlp_addalgo.h.

9.8.3.5 template<typename _RandomAccessIter , typename _RandomAccessIterp > void std::__final_insertion_p_sort (_RandomAccessIter *__first*, _RandomAccessIter *__last*, _RandomAccessIterp *__firstp*, _RandomAccessIterp *__lastp*)

Definition at line 296 of file stlp_addalgo.h.

9.8.3.6 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > void std::__final_insertion_p_sort (_RandomAccessIter *__first*, _RandomAccessIter *__last*, _RandomAccessIterp *__firstp*, _RandomAccessIterp *__lastp*, _Compare *__comp*)

Definition at line 318 of file stlp_addalgo.h.

9.8.3.7 template<typename _RandomAccessIter , typename _RandomAccessIterp > void std::__inplace_stable_p_sort (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp)

Definition at line 1069 of file stlp_addalgo.h.

9.8.3.8 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > void std::__inplace_stable_p_sort (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Compare __comp)

Definition at line 1094 of file stlp_addalgo.h.

9.8.3.9 template<typename _RandomAccessIter , typename _RandomAccessIterp > void std::__insertion_p_sort (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp)

Definition at line 193 of file stlp_addalgo.h.

9.8.3.10 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > void std::__insertion_p_sort (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Compare __comp)

Definition at line 223 of file stlp_addalgo.h.

9.8.3.11 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Size > void std::__intro_p_sort_loop (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Size __depth_limit)

Definition at line 340 of file stlp_addalgo.h.

9.8.3.12 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Size , typename _Compare > void std::__intro_p_sort_loop (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Size __depth_limit, _Compare __comp)

Definition at line 372 of file stlp_addalgo.h.

9.8.3.13 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Size > void std::__introsort_p_loop (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Size __depth_limit)

This is a helper function for the pair_sort routine.

Definition at line 403 of file stlp_addalgo.h.

9.8.3.14 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Size , typename _Compare > void std::__introsort_p_loop (_RandomAccessIter __first, _RandomAccessIter __last, _RandomAccessIterp __firstp, _RandomAccessIterp __lastp, _Size __depth_limit, _Compare __comp)

Definition at line 435 of file stlp_addalgo.h.

9.8.3.49 template<typename _InputIter1 , typename _InputIter2 , typename _OutputIter , typename _InputIter1p , typename _InputIter2p , typename _OutputIterp > pair<_OutputIter,_OutputIterp> std::pair_merge (_InputIter1 *__first1,* _InputIter1 *__last1,* _InputIter2 *__first2,* _InputIter2 *__last2,* _OutputIter *__result,* _InputIter1p *__first1p,* _InputIter1p *__last1p,* _InputIter2p *__first2p,* _InputIter2p *__last2p,* _OutputIterp *__resultp*)

Parameters

first1	An iterator.
first2	Another iterator.
last1	Another iterator.
last2	Another iterator.
result	An iterator pointing to the end of the merged range.

Returns

An iterator pointing to the first element "not less than" *val*.

Merges the ranges [first1,last1) and [first2,last2) into the sorted range [result, result + (last1-first1) + (last2-first2)). Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

Definition at line 841 of file stlp_addalgo.h.

9.8.3.50 template<typename _InputIter1 , typename _InputIter2 , typename _OutputIter , typename _InputIter1p , typename _InputIter2p , typename _OutputIterp , typename _Compare > pair<_OutputIter,_OutputIterp> std::pair_merge (_InputIter1 *__first1,* _InputIter1 *__last1,* _InputIter2 *__first2,* _InputIter2 *__last2,* _OutputIter *__result,* _InputIter1p *__first1p,* _InputIter1p *__last1p,* _InputIter2p *__first2p,* _InputIter2p *__last2p,* _OutputIterp *__resultp,* _Compare *__comp*)

Parameters

first1	An iterator.
first2	Another iterator.
last1	Another iterator.
last2	Another iterator.
result	An iterator pointing to the end of the merged range.
comp	A functor to use for comparisons.

Returns

An iterator pointing to the first element "not less than" *val*.

Merges the ranges [first1,last1) and [first2,last2) into the sorted range [result, result + (last1-first1) + (last2-first2)). Both input ranges must be sorted, and the output range must not overlap with either of the input ranges. The sort is *stable*, that is, for equivalent elements in the two ranges, elements from the first range will always come before elements from the second.

The comparison function should have the same effects on ordering as the function used for the initial sort.

Definition at line 914 of file stlp_addalgo.h.

9.8.3.51 template<typename _RandomAccessIter , typename _RandomAccessIterp > bool std::pair_sort (_RandomAccessIter *__first,* _RandomAccessIter *__last,* _RandomAccessIterp *__firstp,* _RandomAccessIterp *__lastp*) [inline]

Parameters

first	An iterator.
last	Another iterator.
firstp	Yet Another iterator.
lastp	Yet Another Another iterator.

Returns

true if the two ranges had the same length (i.e. sorting worked)

Sorts the elements in the range [first,last) in ascending order, such that ∗(i+1)<∗i is false for each iterator `i` in the range [first,last-1).

The relative ordering of equivalent elements is not preserved, use `stable_pair_sort()` if this is needed.

The order of the elements in the range [firstp, lastp) is changed in parallel to the changes made in the range [first, last). So elements in the two sequences which had the same index before the pair_sort will have the same index after the pair_sort.

Definition at line 482 of file stlp_addalgo.h.

9.8.3.52 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > bool std::pair_sort (_RandomAccessIter *__first,* _RandomAccessIter *__last,* _RandomAccessIterp *__firstp,* _RandomAccessIterp *__lastp,* _Compare *__comp*) [inline]

Parameters

first	An iterator.
last	Another iterator.
firstp	Yet Another iterator.
lastp	Yet Another Another iterator.
comp	A comparison functor.

Returns

true if the two ranges had the same length (i.e. sorting worked)

Sorts the elements in the range [first,last) in ascending order, such that `comp`(∗(i+1),∗i) is false for every iterator `i` in the range [first,last-1).

The relative ordering of equivalent elements is not preserved, use `stable_pair_sort()` if this is needed.

The order of the elements in the range [firstp, lastp) is changed in parallel to the changes made in the range [first, last). So elements in the two sequences which had the same index before the pair_sort will have the same index after the pair_sort.

Definition at line 530 of file stlp_addalgo.h.

9.8.3.53 template<typename _RandomAccessIter , typename _RandomAccessIterp > bool std::partial_pair_sort (_RandomAccessIter *__first,* _RandomAccessIter *__middle,* _RandomAccessIter *__last,* _RandomAccessIterp *__firstp,* _RandomAccessIterp *__lastp*)

Parameters

first	An iterator.
middle	Another iterator.
last	Another iterator.
firstp	Yet Another iterator.
lastp	Yet Another Another iterator.

Returns

true if the two ranges had the same length (i.e. sorting worked)

Sorts the smallest (middle-first) elements in the range [first,last) and moves them to the range [first,middle). The order of the remaining elements in the range [middle,last) is undefined. After the sort if `i` and are iterators in the range [first,middle) such that precedes and is an iterator in the range [middle,last) then `*j<*i` and `*k<*i` are both false.

The order of the elements in the range [firstp, lastp) is changed in parallel to the changes made in the range [first, last). So elements in the two sequences which had the same index before the sort will have the same index after the sort.

Definition at line 1456 of file stlp_addalgo.h.

9.8.3.54 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > bool std::partial_pair_sort (_RandomAccessIter *__first*, _RandomAccessIter *__middle*, _RandomAccessIter *__last*, _RandomAccessIterp *__firstp*, _RandomAccessIterp *__lastp*, _Compare *__comp*)

Parameters

first	An iterator.
middle	Another iterator.
last	Another iterator.
firstp	Yet Another iterator.
lastp	Yet Another Another iterator.

Returns

true if the two ranges had the same length (i.e. sorting worked)

Sorts the smallest (middle-first) elements in the range [first,last) and moves them to the range [first,middle). The order of the remaining elements in the range [middle,last) is undefined. After the sort if `i` and are iterators in the range [first,middle) such that precedes and is an iterator in the range [middle,last) then `*j<*i` and `*k<*i` are both false.

The order of the elements in the range [firstp, lastp) is changed in parallel to the changes made in the range [first, last). So elements in the two sequences which had the same index before the sort will have the same index after the sort.

Definition at line 1514 of file stlp_addalgo.h.

9.8.3.55 template<typename _RandomAccessIter , typename _RandomAccessIterp , typename _Compare > bool std::partial_sort (_RandomAccessIter *__first*, _RandomAccessIter *__middle*, _RandomAccessIter *__last*, _RandomAccessIter *__firstp*, _RandomAccessIter *__lastp*, _Compare *__comp*)

Parameters

first	An iterator.
middle	Another iterator.
last	Another iterator.

firstp	Yet Another iterator.
lastp	Yet Another Another iterator.
comp	A comparison functor.

Returns

true if the two ranges had the same length (i.e. sorting worked)

Sorts the smallest (middle-first) elements in the range [first,last) and moves them to the range [first,middle). The order of the remaining elements in the range [middle,last) is undefined. After the sort if `i` and are iterators in the range [first,middle) such that precedes and is an iterator in the range [middle,last) then `*comp`(j,*i) and `comp(*k,*i)` are both false.

The order of the elements in the range [firstp, lastp) is changed in parallel to the changes made in the range [first, last). So elements in the two sequences which had the same index before the sort will have the same index after the sort.

10 Class Documentation

10.1 coco::dag_delta::__check_nodes Class Reference

Public Member Functions

- __check_nodes (const std::vector< walker > &__nr)
- bool operator() (const walker &_w) const

10.1.1 Detailed Description

This function class is used as a predicate for partitioning the vector of constraints in added constraints and original constraints using `stable_partition`.

10.1.2 Constructor & Destructor Documentation

10.1.2.1 coco::dag_delta::__check_nodes::__check_nodes (const std::vector< walker > & *__nr*) [inline]

Definition at line 287 of file dag_delta.h.

10.1.3 Member Function Documentation

10.1.3.1 bool coco::dag_delta::__check_nodes::operator() (const walker & *_w*) const [inline]

Definition at line 289 of file dag_delta.h.

The documentation for this class was generated from the following file:

- dag_delta.h

10.2 coco::dag_undelta::__check_walkers Class Reference

Public Member Functions

- __check_walkers (const std::vector< walker > &__nr)
- bool operator() (const walker &_w) const

10.2.1 Detailed Description

This function class is used as a predicate for partitioning the vector of constraints in added constraints and original constraints using `stable_partition`.

10.2.2 Constructor & Destructor Documentation

10.2.2.1 coco::dag_undelta::__check_walkers::__check_walkers (const std::vector< walker > & *__nr*) [inline]

Definition at line 89 of file dag_delta.h.

10.2.3 Member Function Documentation

10.2.3.1 bool coco::dag_undelta::__check_walkers::operator() (const walker & *_w*) const [inline]

Definition at line 91 of file dag_delta.h.

The documentation for this class was generated from the following file:

- dag_delta.h

10.3 coco::dag_delta::__docompare_nodes Struct Reference

Public Member Functions

- bool operator() (const expression_walker &_a, unsigned int _b) const
- bool operator() (unsigned int _a, const expression_walker &_b) const
- bool operator() (const expression_walker &_a, const expression_walker &_b) const

10.3.1 Detailed Description

Compare a node with an `unsigned int` (node number) for sorting certain node vectors.

10.3.2 Member Function Documentation

10.3.2.1 bool coco::dag_delta::__docompare_nodes::operator() (const expression_walker & *_a*, unsigned int *_b*) const [inline]

Definition at line 270 of file dag_delta.h.

10.3.2.2 bool coco::dag_delta::__docompare_nodes::operator() (unsigned int *_a*, const expression_walker & *_b*) const [inline]

Definition at line 272 of file dag_delta.h.

10.3.2.3 bool coco::dag_delta::__docompare_nodes::operator() (const expression_walker & _a, const expression_walker & _b) const [inline]

Definition at line 274 of file dag_delta.h.

The documentation for this struct was generated from the following file:

- dag_delta.h

10.4 coco::model::__docompare_nodes Struct Reference

`#include <model.hpp>`

Public Member Functions

- bool operator() (const model::walker &_a, unsigned int _b) const
- bool operator() (unsigned int _a, const model::walker &_b) const
- bool operator() (const model::walker &_a, const model::walker &_b) const

10.4.1 Detailed Description

This function class is used to compare nodes for sorting and binary search.

10.4.2 Member Function Documentation

10.4.2.1 bool coco::model::__docompare_nodes::operator() (const model::walker & _a, unsigned int _b) const [inline]

Definition at line 1836 of file model.hpp.

10.4.2.2 bool coco::model::__docompare_nodes::operator() (unsigned int _a, const model::walker & _b) const [inline]

Definition at line 1838 of file model.hpp.

10.4.2.3 bool coco::model::__docompare_nodes::operator() (const model::walker & _a, const model::walker & _b) const [inline]

Definition at line 1840 of file model.hpp.

The documentation for this struct was generated from the following file:

- model.hpp

10.5 coco::model::__docompare_variables Struct Reference

`#include <model.hpp>`

Public Member Functions

- bool operator() (const model::walker &_a, unsigned int _b) const
- bool operator() (unsigned int _a, const model::walker &_b) const
- bool operator() (const model::walker &_a, const model::walker &_b) const

10.5.1 Detailed Description

This function class is used to compare variables for sorting and binary search.

10.5.2 Member Function Documentation

10.5.2.1 bool coco::model::__docompare_variables::operator() (const model::walker & _a, unsigned int _b) const [inline]

Definition at line 1848 of file model.hpp.

10.5.2.2 bool coco::model::__docompare_variables::operator() (unsigned int _a, const model::walker & _b) const [inline]

Definition at line 1850 of file model.hpp.

10.5.2.3 bool coco::model::__docompare_variables::operator() (const model::walker & _a, const model::walker & _b) const [inline]

Definition at line 1852 of file model.hpp.

The documentation for this struct was generated from the following file:

- model.hpp

10.6 coco::__sg_anc_visitor Class Reference

Public Member Functions

- __sg_anc_visitor (std::set< search_node_id > &anc)

10.7 coco::_evaluator_base Class Reference

Base class of all evaluators.

`#include <evaluator.h>`

Public Types

- typedef _Tp data_type
- typedef _NData node_data_type
- typedef _Result return_value
- typedef _Walker const_walker

Public Member Functions

- _evaluator_base ()
- _evaluator_base (const _Tp &__x)
- _evaluator_base (const _Self &__x)
- virtual ~_evaluator_base ()
- virtual return_value vvalue ()
- virtual return_value value ()
- virtual int vcollect (const return_value &__cresult)
- virtual int collect (const node_data_type &__data, const return_value &__cresult)
- virtual void postorder (const node_data_type &__data)

Protected Attributes

- _Tp eval_data

10.7.1 Detailed Description

This class is the base class of all evaluators. Basically, it is a visitor to expression_node nodes in a DAG.

10.7.2 Member Typedef Documentation

10.7.2.1 typedef _Walker coco::_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Definition at line 312 of file evaluator.h.

10.7.2.2 typedef _Tp coco::_evaluator_base::data_type

The data_type specifies the type of the internal data of the evaluator.

Definition at line 305 of file evaluator.h.

10.7.2.3 typedef _NData coco::_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Definition at line 307 of file evaluator.h.

10.7.2.4 typedef _Result coco::_evaluator_base::return_value

This type is the result type of the evaluator.

Definition at line 310 of file evaluator.h.

10.7.3 Constructor & Destructor Documentation

10.7.3.1 coco::_evaluator_base::_evaluator_base ( ) [inline]

Standard Constructor

Definition at line 320 of file evaluator.h.

10.7.3.2 coco::_evaluator_base::_evaluator_base (const _Tp & __x) [inline]

Constructor, which initializes the internal data

Definition at line 322 of file evaluator.h.

10.7.3.3 coco::_evaluator_base::_evaluator_base (const _Self & __x) [inline]

Standard Copy Constructor

Definition at line 324 of file evaluator.h.

10.7.3.4 virtual coco::_evaluator_base::~_evaluator_base ( ) [inline, virtual]

Standard Destructor

Definition at line 327 of file evaluator.h.

10.7.4 Member Function Documentation

10.7.4.1 virtual int coco::_evaluator_base::collect (const node_data_type & __data, const return_value & __cresult) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-
:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 359 of file evaluator.h.

10.7.4.2 virtual void coco::_evaluator_base::postorder (const node_data_type & *__data*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 364 of file evaluator.h.

10.7.4.3 virtual return_value coco::_evaluator_base::value ( ) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 336 of file evaluator.h.

10.7.4.4 virtual int coco::_evaluator_base::vcollect (const return_value & *__cresult*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 348 of file evaluator.h.

10.7.4.5 virtual return_value coco::_evaluator_base::vvalue ( ) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 332 of file evaluator.h.

10.7.5 Member Data Documentation

10.7.5.1 _Tp coco::_evaluator_base::eval_data [protected]

The internal data of the evaluator

Definition at line 316 of file evaluator.h.

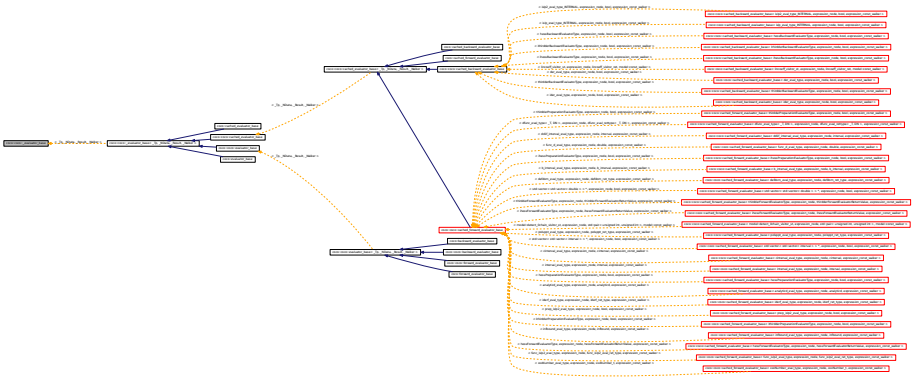
The documentation for this class was generated from the following file:

- evaluator.h

10.8 coco::coco::_evaluator_base Class Reference

Base class of all evaluators.

Inheritance diagram for coco::coco::_evaluator_base:



Public Types

- typedef _Tp data_type
- typedef _NData node_data_type
- typedef _Result return_value
- typedef _Walker const_walker

Public Member Functions

- _evaluator_base ()
- _evaluator_base (const _Tp &__x)
- _evaluator_base (const _Self &__x)
- virtual ~_evaluator_base ()
- virtual return_value vvalue ()
- virtual return_value value ()
- virtual int vcollect (const return_value &__cresult)
- virtual int collect (const node_data_type &__data, const return_value &__cresult)

Protected Attributes

- _Tp eval_data

10.8.1 Detailed Description

This class is the base class of all evaluators. Basically, it is a visitor to expression_node nodes in a DAG.

10.8.2 Member Typedef Documentation

10.8.2.1 typedef _Walker coco::coco::_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented in coco::coco::cached_evaluator_base, coco::cached_evaluator_base, coco::coco::evaluator_base, and coco::evaluator_base.

Definition at line 313 of file search_graph.cc.

10.8.2.2 typedef _Tp coco::coco::_evaluator_base::data_type

The data_type specifies the type of the internal data of the evaluator.

Definition at line 306 of file search_graph.cc.

10.8.2.3 typedef _NData coco::coco::_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented in coco::coco::cached_evaluator_base, coco::cached_evaluator_base, coco::coco::evaluator_base, and coco::evaluator_base.

Definition at line 308 of file search_graph.cc.

10.8.2.4 typedef _Result coco::coco::_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented in coco::coco::cached_evaluator_base, coco::cached_evaluator_base, coco::coco::evaluator_base, and coco::evaluator_base.

Definition at line 311 of file search_graph.cc.

10.8.3 Constructor & Destructor Documentation

10.8.3.1 coco::coco::_evaluator_base::_evaluator_base ( ) [inline]

Standard Constructor

Definition at line 321 of file search_graph.cc.

10.8.3.2 coco::coco::_evaluator_base::_evaluator_base (const _Tp & __x) [inline]

Constructor, which initializes the internal data

Definition at line 323 of file search_graph.cc.

10.8.3.3 coco::coco::_evaluator_base::_evaluator_base (const _Self & __x) [inline]

Standard Copy Constructor

Definition at line 325 of file search_graph.cc.

10.8.3.4 virtual coco::coco::_evaluator_base::~_evaluator_base ( ) [inline, virtual]

Standard Destructor

Definition at line 328 of file search_graph.cc.

10.8.4 Member Function Documentation

10.8.4.1 virtual int coco::coco::_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__cresult*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 360 of file search_graph.cc.

10.8.4.2 virtual void coco::coco::_evaluator_base::postorder (const node_data_type & *__data*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 365 of file search_graph.cc.

10.8.4.3 virtual return_value coco::coco::_evaluator_base::value ( ) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 337 of file search_graph.cc.

10.8.4.4 virtual int coco::coco::_evaluator_base::vcollect (const return_value & *__cresult*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 349 of file search_graph.cc.

10.8.4.5 virtual return_value coco::coco::_evaluator_base::vvalue ( ) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 333 of file search_graph.cc.

10.8.5 Member Data Documentation

10.8.5.1 _Tp coco::coco::_evaluator_base::eval_data [protected]

The internal data of the evaluator

Definition at line 317 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.9 coco::analyticd_eval Class Reference

`#include <ade_evaluator.h>`

Inheritance diagram for coco::analyticd_eval:

Collaboration diagram for coco::analyticd_eval:

Public Types

10.9.1 Member Typedef Documentation

10.9.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.9.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.9.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.9.2 Constructor & Destructor Documentation

10.9.2.1 coco::analyticd_eval::analyticd_eval (const std::vector< analyticd > & __x, const variable_indicator & __v, const model & __m, std::vector< analyticd > * __c) [inline]

Definition at line 116 of file ade_evaluator.h.

10.9.2.2 coco::analyticd_eval::analyticd_eval (const analyticd_eval & __v) [inline]

Definition at line 128 of file ade_evaluator.h.

10.9.2.3 coco::analyticd_eval::~analyticd_eval ( ) [inline]

Definition at line 130 of file ade_evaluator.h.

10.9.3 Member Function Documentation

10.9.3.1 void coco::analyticd_eval::calculate (const expression_node & __data) [inline]

Definition at line 193 of file ade_evaluator.h.

10.9.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.9.3.3 analyticd coco::analyticd_eval::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< analyticd_eval_type, expression_node, analyticd, expression_const_walker >.

Definition at line 707 of file ade_evaluator.h.

10.9.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.9.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.9.3.6 void coco::analyticd_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< analyticd_eval_type, expression_node, analyticd, expression_const_walker >.

Definition at line 135 of file ade_evaluator.h.

10.9.3.7 int coco::analyticd_eval::initialize (const expression_node & *__data*) [inline]

Definition at line 137 of file ade_evaluator.h.

10.9.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.9.3.9 bool coco::analyticd_eval::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< analyticd_eval_type, expression_node, analyticd, expression_const_walker >.

Definition at line 70 of file ade_evaluator.h.

10.9.3.10 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.9.3.11 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.9.3.12 void coco::analyticd_eval::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 205 of file ade_evaluator.h.

10.9.3.13 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.9.3.14 expression_const_walker coco::analyticd_eval::short_cut_to (const expression_node & __data) [inline]

Definition at line 132 of file ade_evaluator.h.

10.9.3.15 int coco::analyticd_eval::update (const analyticd & __rval) [inline]

Definition at line 221 of file ade_evaluator.h.

10.9.3.16 int coco::analyticd_eval::update (const expression_node & __data, const analyticd & __rval) [inline]

Definition at line 227 of file ade_evaluator.h.

10.9.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.9.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.9.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.9.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.9.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.9.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

Protected Attributes

- std::string _action

10.13.1 Detailed Description

The annotation_delta class describes the apply information for changes to the annotation structure in the work_node.

10.13.2 Constructor & Destructor Documentation

10.13.2.1 coco::annotation_delta::annotation_delta (const std::string & *_act*) [inline]

standard constructor: `_act` describes the action specifier of the delta

Definition at line 107 of file annotation_delta.h.

10.13.2.2 coco::annotation_delta::annotation_delta (const std::string & _act, const std::vector< annotation > & __a, const std::vector< annotation > & __r) [inline]

constructor: _act describes the action specifier of the delta, the annotations ___a are added, the annotations ___r removed.

Definition at line 112 of file annotation_delta.h.

10.13.2.3 coco::annotation_delta::annotation_delta (const std::string & _act, const annotation & _ad) [inline]

constructor: _act describes the action specifier of the delta, the annotation _ad is added, nothing is removed.

Definition at line 120 of file annotation_delta.h.

10.13.2.4 coco::annotation_delta::annotation_delta (const std::string & _act, bool _dummy, const annotation & _rm) [inline]

constructor: _act describes the action specifier of the delta, the annotation _rm is removed, nothing is added. The parameter _dummy is ignored.

Definition at line 127 of file annotation_delta.h.

10.13.2.5 coco::annotation_delta::annotation_delta (const annotation_delta & __d) [inline]

standard copy constructor

Definition at line 131 of file annotation_delta.h.

10.13.2.6 coco::annotation_delta::annotation_delta (const char * _act, const std::vector< annotation > & __a, const std::vector< annotation > & __r) [inline]

constructor: _act describes the action specifier of the delta, the annotations ___a are added, the annotations ___r removed.

Definition at line 142 of file annotation_delta.h.

10.13.2.7 coco::annotation_delta::annotation_delta (const char * _act, const annotation & _ad) [inline]

constructor: _act describes the action specifier of the delta, the annotation _ad is added, nothing is removed.

Definition at line 150 of file annotation_delta.h.

10.13.2.8 coco::annotation_delta::annotation_delta (const char * _act, bool _dummy, const annotation & _rm) [inline]

constructor: _act describes the action specifier of the delta, the annotation _rm is removed, nothing is added. The parameter _dummy is ignored.

Definition at line 157 of file annotation_delta.h.

10.13.3 Member Function Documentation

10.13.3.1 bool coco::annotation_delta::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_did*, size_t & *delta_size*) const [virtual]

apply operation: apply the delta with identity _did to work_node _x and construct in _u the undelta information.

Definition at line 35 of file annotation_delta.cc.

10.13.3.2 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.13.3.3 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.13.3.4 bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.13.3.5 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.13.3.6 virtual void coco::coco::delta_base::convert (work_node & *_x*, delta_base *& *_d*) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.13.3.7 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.13.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.13.3.9 virtual void coco::annotation_delta::destroy_copy (delta_base * __d) const [inline, virtual]

clone destructor

Definition at line 164 of file annotation_delta.h.

10.13.3.10 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.13.3.11 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.13.3.12 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.13.3.13 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.13.3.14 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.13.3.15 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.13.3.16 virtual annotation_delta* coco::annotation_delta::new_copy ( ) const [inline, virtual]

clone operation

Reimplemented from coco::coco::delta_base.

Definition at line 161 of file annotation_delta.h.

10.13.3.17 bool coco::annotation_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 177 of file annotation_delta.h.

10.13.3.18 bool coco::annotation_delta::operator!= (const annotation_delta & *_c*) const [inline]

Definition at line 184 of file annotation_delta.h.

10.13.3.19 bool coco::annotation_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Definition at line 174 of file annotation_delta.h.

10.13.3.20 bool coco::annotation_delta::operator== (const annotation_delta & *_c*) const [inline]

Comparison operators

Definition at line 182 of file annotation_delta.h.

10.13.3.21 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.13.3.22 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.13.3.23 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.13.4 Member Data Documentation

10.13.4.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

10.13.4.2 std::vector<annotation> coco::annotation_delta::add

the annotations to be added to the work_node

Definition at line 99 of file annotation_delta.h.

10.13.4.3 std::vector<annotation> coco::annotation_delta::rm

the annotations to be removed from the work_node

Definition at line 101 of file annotation_delta.h.

The documentation for this class was generated from the following files:

- annotation_delta.h
- annotation_delta.cc

10.14 coco::annotation_undelta Class Reference

the undelta class for annotation changes

- std::vector< annotation > removed_ann

Friends

- class annotation_delta

10.14.1 Detailed Description

The annotation_undelta class describes the unapply information for changes to the annotation structure in the work_node.

10.14.2 Constructor & Destructor Documentation

10.14.2.1 coco::annotation_undelta::annotation_undelta (const std::vector< annotation > & __a, const std::vector< annotation > & __r) [inline]

constructor explicitly specifying the lists ___a of added annotations and ___r of removed annotations

Definition at line 51 of file annotation_delta.h.

10.14.2.2 coco::annotation_undelta::annotation_undelta (const std::vector< annotation > & __a) [inline]

constructor explicitly specifying the lists ___a of added annotations, keeping the removed annotations empty

Definition at line 58 of file annotation_delta.h.

10.14.2.3 coco::annotation_undelta::annotation_undelta (const annotation & __a) [inline]

constructor for a single added annotation

Definition at line 63 of file annotation_delta.h.

10.14.2.4 coco::annotation_undelta::annotation_undelta (const annotation_undelta & __d) [inline]

standard copy constructor

Definition at line 68 of file annotation_delta.h.

10.14.3 Member Function Documentation

10.14.3.1 void coco::annotation_undelta::destroy_copy (undelta_base * __d) const [inline]

clone destructor

Definition at line 80 of file annotation_delta.h.

10.14.3.2 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.14.3.3 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.14.3.4 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.14.3.5 annotation_undelta* coco::annotation_undelta::new_copy ( ) const [inline, virtual]

cloning operation

Reimplemented from coco::coco::undelta_base.

Definition at line 78 of file annotation_delta.h.

10.14.3.6 bool coco::annotation_undelta::unapply (work_node & _x, const delta_id & _did) const [virtual]

unapply operation: undoing the delta with identity _did from work_node _x

Reimplemented from coco::coco::undelta_base.

Definition at line 63 of file annotation_delta.cc.

10.14.3.7 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.14.3.8 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.14.3.9 bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [inline, virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

Definition at line 94 of file api_delta.h.

10.14.4 Friends And Related Function Documentation

10.14.4.1 friend class annotation_delta [friend]

Definition at line 86 of file annotation_delta.h.

10.14.5 Member Data Documentation

10.14.5.1 std::vector<annotation> coco::annotation_undelta::added_ann

these are the annotations added by the corresponding annotation_delta

Definition at line 44 of file annotation_delta.h.

10.14.5.2 std::vector<annotation> coco::annotation_undelta::removed_ann

these are the annotations removed by the corresponding annotation_delta

Definition at line 46 of file annotation_delta.h.

The documentation for this class was generated from the following files:

- annotation_delta.h

10.15 coco::api_exception Class Reference

API exception class.

`#include <api_exception.h>`

Public Member Functions

- api_exception (api_exception_type a, char const *m)
- api_exception (api_exception_type a, const std::string &m)
- virtual ~api_exception () throw ()
- virtual char const * what () const throw ()
- virtual api_exception_type type () const throw ()
- virtual const char * type_str () const throw ()
- virtual std::string message () const throw ()

10.15.1 Detailed Description

This is the base class for all exceptions which are thrown by the API and the various modules of the COCONUT environment. Every properly coded COCONUT module should only throw this exception or some of its subclasses.

10.15.2 Constructor & Destructor Documentation

10.15.2.1 coco::api_exception::api_exception (api_exception_type *a*, char const * *m*) [inline]

Constructor, setting the type to `a` and the message to `m`

Definition at line 79 of file api_exception.h.

10.15.2.2 coco::api_exception::api_exception (api_exception_type *a*, const std::string & *m*) [inline]

Constructor, setting the type to `a` and the message to `m`

Definition at line 82 of file api_exception.h.

10.15.2.3 virtual coco::api_exception::~api_exception ( ) throw () [inline, virtual]

Standard Destructor

Definition at line 86 of file api_exception.h.

10.15.3 Member Function Documentation

10.15.3.1 virtual std::string coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file api_exception.h.

10.15.3.2 virtual api_exception_type coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file api_exception.h.

10.15.3.3 virtual const char* coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

10.15.3.4 virtual char const* coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file api_exception.h.

The documentation for this class was generated from the following file:

- api_exception.h

10.16 coco::coco::coco::api_exception Class Reference

API exception class.

Standard Destructor

Definition at line 86 of file search_graph.cc.

10.17.3 Member Function Documentation

10.17.3.1 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file expression.h.

10.17.3.2 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.17.3.3 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.17.3.4 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.17.3.5 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.17.3.6 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file expression.h.

10.17.3.7 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.17.3.8 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.17.3.9 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.17.3.10 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.17.3.11 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

10.17.3.12 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

10.17.3.13 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

10.17.3.14 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

10.17.3.15 const char * coco::api_exception::type_str ( ) const throw () [virtual]

This method returns the exception type as C-string.

Definition at line 57 of file api_exception.cc.

10.17.3.16 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.17.3.17 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.17.3.18 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file expression.h.

10.17.3.19 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.17.3.20 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.18.1 Member Typedef Documentation

10.18.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.18.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.18.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.18.2 Constructor & Destructor Documentation

10.18.2.1 coco::b_interval_eval::b_interval_eval (const std::vector< b_interval > & __x, const variable_indicator & __v, const model & __m, std::vector< b_interval > * __c) [inline]

Definition at line 116 of file bint_evaluator.h.

10.18.2.2 coco::b_interval_eval::b_interval_eval (const b_interval_eval & __v) [inline]

Definition at line 128 of file bint_evaluator.h.

10.18.2.3 coco::b_interval_eval::~b_interval_eval ( ) [inline]

Definition at line 130 of file bint_evaluator.h.

10.18.3 Member Function Documentation

10.18.3.1 void coco::b_interval_eval::calculate (const expression_node & __data) [inline]

Definition at line 193 of file bint_evaluator.h.

10.18.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.18.3.3 b_interval coco::b_interval_eval::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< b_interval_eval_type, expression_node, b_interval, expression_const_walker >.

Definition at line 707 of file bint_evaluator.h.

10.18.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.18.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.18.3.6 void coco::b_interval_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< b_interval_eval_type, expression_node, b_interval, expression_const_walker >.

Definition at line 135 of file bint_evaluator.h.

10.18.3.7 int coco::b_interval_eval::initialize (const expression_node & *__data*) [inline]

Definition at line 137 of file bint_evaluator.h.

10.18.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.18.3.9 bool coco::b_interval_eval::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< b_interval_eval_type, expression_node, b_interval, expression_const_walker >.

Definition at line 70 of file bint_evaluator.h.

10.18.3.10 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.18.3.11 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.18.3.12 void coco::b_interval_eval::retrieve_from_cache (const expression_node & *__data*) [inline]

Definition at line 205 of file bint_evaluator.h.

10.18.3.13 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.18.3.14 expression_const_walker coco::b_interval_eval::short_cut_to (const expression_node & *__data*) [inline]

Definition at line 132 of file bint_evaluator.h.

10.18.3.15 int coco::b_interval_eval::update (const b_interval & *__rval*) [inline]

Definition at line 221 of file bint_evaluator.h.

10.18.3.16 int coco::b_interval_eval::update (const expression_node & *__data*, const b_interval & *__rval*) [inline]

Definition at line 227 of file bint_evaluator.h.

10.18.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.18.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.18.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 763 of file search_graph.cc.

10.18.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.18.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.18.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.20.1 Detailed Description

This class is the base class of all non-caching backward evaluators. Basically, it is a visitor to expression_-node nodes in a DAG, based on evaluator_base.

10.20.2 Member Typedef Documentation

10.20.2.1 typedef _Base::const_walker coco::backward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 601 of file evaluator.h.

10.20.2.2 typedef _Base::node_data_type coco::backward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 597 of file evaluator.h.

10.20.2.3 typedef _Base::return_value coco::backward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 599 of file evaluator.h.

10.20.3 Constructor & Destructor Documentation

10.20.3.1 coco::backward_evaluator_base::backward_evaluator_base ( ) [inline]

Standard Constructor

Definition at line 606 of file evaluator.h.

10.20.3.2 coco::backward_evaluator_base::backward_evaluator_base (const _Tp & __x) [inline]

Constructor

Definition at line 608 of file evaluator.h.

10.20.3.3 coco::backward_evaluator_base::backward_evaluator_base (const _Self & __x) [inline]

Standard Copy Constructor

Definition at line 610 of file evaluator.h.

10.20.3.4 virtual coco::backward_evaluator_base::~backward_evaluator_base ( ) [inline, virtual]

Standard Destructor

Definition at line 612 of file evaluator.h.

10.20.4 Member Function Documentation

10.20.4.1 virtual int coco::backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 669 of file evaluator.h.

10.20.4.2 virtual return_value coco::backward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Definition at line 700 of file evaluator.h.

10.20.4.3 virtual void coco::backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 673 of file evaluator.h.

10.20.4.4 int coco::backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 628 of file evaluator.h.

10.20.4.5 virtual void coco::backward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 654 of file evaluator.h.

10.20.4.6 virtual void coco::backward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 658 of file evaluator.h.

10.20.4.7 void coco::backward_evaluator_base::postorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 623 of file evaluator.h.

10.20.4.8 virtual int coco::coco::evaluator_base::preorder (const node_data_type & *__data*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 402 of file search_graph.cc.

10.20.4.9 int coco::backward_evaluator_base::preorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It is translated into calls to initialize and calculate.

Definition at line 618 of file evaluator.h.

10.20.4.10 virtual const_walker coco::coco::evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the const_walker returned is the target of the short-cut.

Definition at line 406 of file search_graph.cc.

10.20.4.11 virtual int coco::backward_evaluator_base::update (const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The

return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 684 of file evaluator.h.

10.20.4.12 virtual int coco::backward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 695 of file evaluator.h.

10.20.4.13 return_value coco::backward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 640 of file evaluator.h.

10.20.4.14 int coco::backward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 634 of file evaluator.h.

10.20.4.15 void coco::backward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 649 of file evaluator.h.

10.20.4.16 return_value coco::backward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 645 of file evaluator.h.

The documentation for this class was generated from the following file:

- evaluator.h

10.21.1 Detailed Description

This class is the base class of all non-caching backward evaluators. Basically, it is a visitor to expression_-node nodes in a DAG, based on evaluator_base.

10.21.2 Member Typedef Documentation

10.21.2.1 typedef _Base::const_walker coco::coco::backward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 602 of file search_graph.cc.

10.21.2.2 typedef _Base::node_data_type coco::coco::backward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 598 of file search_graph.cc.

10.21.2.3 typedef _Base::return_value coco::coco::backward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 600 of file search_graph.cc.

10.21.3 Constructor & Destructor Documentation

10.21.3.1 coco::coco::backward_evaluator_base::backward_evaluator_base ( ) [inline]

Standard Constructor

Definition at line 607 of file search_graph.cc.

10.21.3.2 coco::coco::backward_evaluator_base::backward_evaluator_base (const _Tp & __x) [inline]

Constructor

Definition at line 609 of file search_graph.cc.

10.21.3.3 coco::coco::backward_evaluator_base::backward_evaluator_base (const _Self & __x) [inline]

Standard Copy Constructor

Definition at line 611 of file search_graph.cc.

10.21.3.4 virtual coco::coco::backward_evaluator_base::~backward_evaluator_base ( ) [inline, virtual]

Standard Destructor

Definition at line 613 of file search_graph.cc.

10.21.4 Member Function Documentation

10.21.4.1 virtual int coco::coco::backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 670 of file search_graph.cc.

10.21.4.2 virtual return_value coco::coco::backward_evaluator_base::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Definition at line 701 of file search_graph.cc.

10.21.4.3 virtual void coco::coco::backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 674 of file search_graph.cc.

10.21.4.4 int coco::coco::backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 629 of file search_graph.cc.

10.21.4.5 virtual void coco::coco::backward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 655 of file search_graph.cc.

10.21.4.6 virtual void coco::coco::backward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 659 of file search_graph.cc.

10.21.4.7 void coco::coco::backward_evaluator_base::postorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 624 of file search_graph.cc.

10.21.4.8 virtual int coco::coco::evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 402 of file search_graph.cc.

10.21.4.9 int coco::coco::backward_evaluator_base::preorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It is translated into calls to initialize and calculate.

Definition at line 619 of file search_graph.cc.

10.21.4.10 virtual const_walker coco::coco::evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 406 of file search_graph.cc.

10.21.4.11 virtual int coco::coco::backward_evaluator_base::update (const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 685 of file search_graph.cc.

10.21.4.12 virtual int coco::coco::backward_evaluator_base::update (const node_data_type & *__data,* const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 696 of file search_graph.cc.

10.21.4.13 return_value coco::coco::backward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 641 of file search_graph.cc.

10.21.4.14 int coco::coco::backward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 635 of file search_graph.cc.

10.21.4.15 void coco::coco::backward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 650 of file search_graph.cc.

10.21.4.16 return_value coco::coco::backward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 646 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.22 coco::coco::coco::basic_alltype Class Reference

The basic alltype which can hold any of a number of basic types.

10.22.1 Detailed Description

This class is the base of the data handling in the API. It can hold values of different types: bool, int, unsigned int, double, interval, string, Number, vector<bool>, vector<int>, vector<unsigned int>, vector<double>, vector<interval>, vector<string>, vector<Number>, sparse_vector<bool>, sparse_vector<int>, sparse_vector<unsigned int>, sparse_vector<double>, sparse_vector<interval>, sparse_vector<string>, sparse_vector<Number>, dense_matrix<double>, dense_matrix<int>, dense_matrix<interval>, dense_matrix<string>, dense_matrix<Number>, sparse_matrix<double>, sparse_matrix<int>, sparse_matrix<interval>, sparse_matrix<string>, sparse_matrix<Number>. All of these types can be stored and retrieved conveniently.

10.22.2 Constructor & Destructor Documentation

10.22.2.1 coco::coco::coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file search_graph.cc.

10.22.2.2 coco::coco::coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool ___x

Definition at line 482 of file search_graph.cc.

10.22.2.3 coco::coco::coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int ___x

Definition at line 485 of file search_graph.cc.

10.22.2.4 coco::coco::coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int ___x

Definition at line 488 of file search_graph.cc.

10.22.2.5 coco::coco::coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double ___x

Definition at line 491 of file search_graph.cc.

10.22.2.6 coco::coco::coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval ___x

Definition at line 494 of file search_graph.cc.

10.22.2.7 coco::coco::coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file search_graph.cc.

10.22.2.8 coco::coco::coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file search_graph.cc.

10.22.2.9 coco::coco::coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file search_graph.cc.

10.22.2.10 coco::coco::coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number ___y

Definition at line 506 of file search_graph.cc.

10.22.2.11 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> __x

Definition at line 510 of file search_graph.cc.

10.22.2.12 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> __x

Definition at line 514 of file search_graph.cc.

10.22.2.13 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> __x

Definition at line 518 of file search_graph.cc.

10.22.2.14 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> __x

Definition at line 522 of file search_graph.cc.

10.22.2.15 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> __x

Definition at line 526 of file search_graph.cc.

10.22.2.16 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> __x

Definition at line 530 of file search_graph.cc.

10.22.2.17 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> __x

Definition at line 534 of file search_graph.cc.

10.22.2.18 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file search_graph.cc.

10.22.2.19 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file search_graph.cc.

10.22.2.20 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file search_graph.cc.

10.22.2.21 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file search_graph.cc.

10.22.2.22 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file search_graph.cc.

10.22.2.23 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file search_graph.cc.

10.22.2.24 coco::coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file search_graph.cc.

10.22.2.25 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file search_graph.cc.

10.22.2.26 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file search_graph.cc.

10.22.2.27 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file search_graph.cc.

10.22.2.28 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file search_graph.cc.

10.22.2.29 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file search_graph.cc.

10.22.2.30 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file search_graph.cc.

10.22.2.31 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file search_graph.cc.

10.22.2.32 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file search_graph.cc.

10.22.2.33 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file search_graph.cc.

10.22.2.34 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file search_graph.cc.

10.22.2.35 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file search_graph.cc.

10.22.2.36 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file search_graph.cc.

10.22.2.37 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file search_graph.cc.

10.22.2.38 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file search_graph.cc.

10.22.2.39 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file search_graph.cc.

10.22.2.40 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> __x

Definition at line 630 of file search_graph.cc.

10.22.2.41 coco::coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> __x

Definition at line 634 of file search_graph.cc.

10.22.2.42 coco::coco::coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file search_graph.cc.

10.22.2.43 coco::coco::coco::basic_alltype::basic_alltype (const basic_alltype & *__a*) [inline]

Standard Copy Constructor

Definition at line 643 of file search_graph.cc.

10.22.3 Member Function Documentation

10.22.3.1 const std::vector<bool>& coco::coco::coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file search_graph.cc.

10.22.3.2 std::vector<bool>& coco::coco::coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file search_graph.cc.

10.22.3.3 const std::vector<std::string>& coco::coco::coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file search_graph.cc.

10.22.3.4 std::vector<std::string>& coco::coco::coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file search_graph.cc.

10.22.3.5 const vmtl::dense_matrix<std::string>& coco::coco::coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file search_graph.cc.

10.22.3.6 vmtl::dense_matrix<std::string>& coco::coco::coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file search_graph.cc.

10.22.3.7 basic_alltype& coco::coco::coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file search_graph.cc.

10.22.3.8 int coco::coco::coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file search_graph.cc.

10.22.3.9 const vmtl::sparse_matrix<std::string>& coco::coco::coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file search_graph.cc.

10.22.3.10 vmtl::sparse_matrix<std::string>& coco::coco::coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file search_graph.cc.

10.22.3.11 const std::vector<double>& coco::coco::coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file search_graph.cc.

10.22.3.12 std::vector<double>& coco::coco::coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file search_graph.cc.

10.22.3.13 const vmtl::dense_matrix<double>& coco::coco::coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file search_graph.cc.

10.22.3.14 vmtl::dense_matrix<double>& coco::coco::coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file search_graph.cc.

10.22.3.15 bool coco::coco::coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file search_graph.cc.

10.22.3.16 const std::vector<interval>& coco::coco::coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file search_graph.cc.

10.22.3.17 std::vector<interval>& coco::coco::coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file search_graph.cc.

10.22.3.18 const vmtl::dense_matrix<interval>& coco::coco::coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file search_graph.cc.

10.22.3.19 vmtl::dense_matrix<interval>& coco::coco::coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file search_graph.cc.

10.22.3.20 bool coco::coco::coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file search_graph.cc.

10.22.3.21 bool coco::coco::coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file search_graph.cc.

10.22.3.22 bool coco::coco::coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file search_graph.cc.

10.22.3.23 bool coco::coco::coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file search_graph.cc.

10.22.3.24 bool coco::coco::coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file search_graph.cc.

10.22.3.25 bool coco::coco::coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file search_graph.cc.

10.22.3.26 bool coco::coco::coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file search_graph.cc.

10.22.3.27 bool coco::coco::coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file search_graph.cc.

10.22.3.28 bool coco::coco::coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file search_graph.cc.

10.22.3.29 bool coco::coco::coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file search_graph.cc.

10.22.3.30 bool coco::coco::coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file search_graph.cc.

10.22.3.31 const vmtl::sparse_matrix<interval>& coco::coco::coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file search_graph.cc.

10.22.3.32 vmtl::sparse_matrix<interval>& coco::coco::coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file search_graph.cc.

10.22.3.33 bool coco::coco::coco::basic_alltype::less_equal (const basic_alltype & *b*) const

Total order comparison operator

10.22.3.34 bool coco::coco::coco::basic_alltype::less_than (const basic_alltype & *b*) const

Total order comparison operator

10.22.3.35 const std::vector<int>& coco::coco::coco::basic_alltype::n ( ) const [inline]

retrieve a vector<int> from the basic_alltype

Definition at line 1089 of file search_graph.cc.

10.22.3.36 std::vector<int>& coco::coco::coco::basic_alltype::n ( ) [inline]

retrieve a vector<int> from the basic_alltype

Definition at line 1361 of file search_graph.cc.

10.22.3.37 bool coco::coco::coco::basic_alltype::nb ( ) const [inline]

retrieve a bool from the basic_alltype

Definition at line 1049 of file search_graph.cc.

10.22.3.38 bool& coco::coco::coco::basic_alltype::nb ( ) [inline]

retrieve a bool from the basic_alltype

Definition at line 1321 of file search_graph.cc.

10.22.3.39 double coco::coco::coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file search_graph.cc.

10.22.3.40 double& coco::coco::coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file search_graph.cc.

10.22.3.41 const vmtl::dense_matrix<int>& coco::coco::coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file search_graph.cc.

10.22.3.42 vmtl::dense_matrix<int>& coco::coco::coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file search_graph.cc.

10.22.3.43 interval coco::coco::coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file search_graph.cc.

10.22.3.44 interval_st& coco::coco::coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file search_graph.cc.

10.22.3.45 int coco::coco::coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file search_graph.cc.

10.22.3.46 int& coco::coco::coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file search_graph.cc.

10.22.3.47 const vmtl::sparse_matrix<int>& coco::coco::coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file search_graph.cc.

10.22.3.48 vmtl::sparse_matrix<int>& coco::coco::coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file search_graph.cc.

10.22.3.49 unsigned int coco::coco::coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file search_graph.cc.

10.22.3.50 unsigned int& coco::coco::coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file search_graph.cc.

10.22.3.51 bool coco::coco::coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

10.22.3.52 basic_alltype& coco::coco::coco::basic_alltype::operator= (bool *__x*) [inline]

Assignment Operator, assigning the bool value __x

Definition at line 647 of file search_graph.cc.

10.22.3.53 basic_alltype& coco::coco::coco::basic_alltype::operator= (int *__x*) [inline]

Assignment Operator, assigning the int value __x

Definition at line 653 of file search_graph.cc.

10.22.3.54 basic_alltype& coco::coco::coco::basic_alltype::operator= (unsigned int *__x*) [inline]

Assignment Operator, assigning the unsigned int value __x

Definition at line 659 of file search_graph.cc.

10.22.3.55 basic_alltype& coco::coco::coco::basic_alltype::operator= (double __x) [inline]

Assignment Operator, assigning the double value __x

Definition at line 665 of file search_graph.cc.

10.22.3.56 basic_alltype& coco::coco::coco::basic_alltype::operator= (interval __x) [inline]

Assignment Operator, assigning the interval value __x

Definition at line 671 of file search_graph.cc.

10.22.3.57 basic_alltype& coco::coco::coco::basic_alltype::operator= (void * __x) [inline]

Assignment Operator, assigning the void* value __x

Definition at line 677 of file search_graph.cc.

10.22.3.58 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::string & __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 683 of file search_graph.cc.

10.22.3.59 basic_alltype& coco::coco::coco::basic_alltype::operator= (const char * __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 690 of file search_graph.cc.

10.22.3.60 basic_alltype& coco::coco::coco::basic_alltype::operator= (const num::Number & __x) [inline]

Assignment Operator, assigning the Number value __x

Definition at line 697 of file search_graph.cc.

10.22.3.61 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value __x

Definition at line 704 of file search_graph.cc.

10.22.3.62 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value __x

Definition at line 711 of file search_graph.cc.

10.22.3.63 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value __x

Definition at line 718 of file search_graph.cc.

10.22.3.64 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< double > & __x) [inline]

Assignment Operator, assigning the vector<double> value __x

Definition at line 725 of file search_graph.cc.

10.22.3.65 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< interval > & __x) [inline]

Assignment Operator, assigning the vector<interval> value __x

Definition at line 732 of file search_graph.cc.

10.22.3.66 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::string > & __x) [inline]

Assignment Operator, assigning the vector<string> value __x

Definition at line 739 of file search_graph.cc.

10.22.3.67 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< num::Number > & __x) [inline]

Assignment Operator, assigning the vector<Number> value __x

Definition at line 746 of file search_graph.cc.

10.22.3.68 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< bool > > & __x) [inline]

Assignment Operator, assigning the vector<vector<bool> > value __x

Definition at line 753 of file search_graph.cc.

10.22.3.69 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value __x

Definition at line 760 of file search_graph.cc.

10.22.3.70 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value __x

Definition at line 767 of file search_graph.cc.

10.22.3.71 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value __x

Definition at line 774 of file search_graph.cc.

10.22.3.72 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value __x

Definition at line 781 of file search_graph.cc.

10.22.3.73 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value __x

Definition at line 788 of file search_graph.cc.

10.22.3.74 basic_alltype& coco::coco::coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value __x

Definition at line 795 of file search_graph.cc.

10.22.3.75 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value __x

Definition at line 802 of file search_graph.cc.

10.22.3.76 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value __x

Definition at line 809 of file search_graph.cc.

10.22.3.77 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file search_graph.cc.

10.22.3.78 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file search_graph.cc.

10.22.3.79 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file search_graph.cc.

10.22.3.80 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file search_graph.cc.

10.22.3.81 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file search_graph.cc.

10.22.3.82 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file search_graph.cc.

10.22.3.83 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file search_graph.cc.

10.22.3.84 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file search_graph.cc.

10.22.3.85 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file search_graph.cc.

10.22.3.86 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file search_graph.cc.

10.22.3.87 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_matrix< double > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<double> value __x

Definition at line 886 of file search_graph.cc.

10.22.3.88 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_matrix< int > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<int> value ___x

Definition at line 893 of file search_graph.cc.

10.22.3.89 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_matrix< interval > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<interval> value ___x

Definition at line 900 of file search_graph.cc.

10.22.3.90 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<string> value ___x

Definition at line 907 of file search_graph.cc.

10.22.3.91 basic_alltype& coco::coco::coco::basic_alltype::operator= (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<Number> value ___x

Definition at line 914 of file search_graph.cc.

10.22.3.92 basic_alltype& coco::coco::coco::basic_alltype::operator= (const basic_alltype & __a) [inline]

Standard Assignment Operator

Definition at line 921 of file search_graph.cc.

10.22.3.93 bool coco::coco::coco::basic_alltype::operator== (const basic_alltype & b) const

Standard comparison operator

10.22.3.94 const void* coco::coco::coco::basic_alltype::p ( ) const [inline]

retrieve a void* from the basic_alltype

Definition at line 1076 of file search_graph.cc.

10.22.3.95 void*& coco::coco::coco::basic_alltype::p ( ) [inline]

retrieve a void* reference from the basic_alltype

Definition at line 1348 of file search_graph.cc.

10.22.3.96 const std::string& coco::coco::coco::basic_alltype::s ( ) const [inline]

retrieve a string from the basic_alltype

Definition at line 1079 of file search_graph.cc.

10.22.3.97 std::string& coco::coco::coco::basic_alltype::s ( ) [inline]

retrieve a string from the basic_alltype

Definition at line 1351 of file search_graph.cc.

10.22.3.98 const vmtl::sparse_vector<bool>& coco::coco::coco::basic_alltype::sb ( ) const [inline]

retrieve a sparse_vector<bool> from the basic_alltype

Definition at line 1224 of file search_graph.cc.

10.22.3.99 vmtl::sparse_vector<bool>& coco::coco::coco::basic_alltype::sb ( ) [inline]

retrieve a sparse_vector<bool> from the basic_alltype

Definition at line 1495 of file search_graph.cc.

10.22.3.100 const vmtl::sparse_vector<std::string>& coco::coco::coco::basic_alltype::sc ( ) const [inline]

retrieve a sparse_vector<string> from the basic_alltype

Definition at line 1280 of file search_graph.cc.

10.22.3.101 vmtl::sparse_vector<std::string>& coco::coco::coco::basic_alltype::sc ( ) [inline]

retrieve a sparse_vector<string> from the basic_alltype

Definition at line 1551 of file search_graph.cc.

10.22.3.102 const vmtl::sparse_vector<double>& coco::coco::coco::basic_alltype::sd ( ) const [inline]

retrieve a sparse_vector<double> from the basic_alltype

Definition at line 1272 of file search_graph.cc.

10.22.3.103 vmtl::sparse_vector<double>& coco::coco::coco::basic_alltype::sd ( ) [inline]

retrieve a sparse_vector<double> from the basic_alltype

Definition at line 1543 of file search_graph.cc.

10.22.3.104 basic_alltype& coco::coco::coco::basic_alltype::set_cdm (vmtl::dense_matrix< std::string > * __m) [inline]

This method assigns a dense_matrix<string>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<string>.

Definition at line 973 of file search_graph.cc.

10.22.3.105 basic_alltype& coco::coco::coco::basic_alltype::set_csm (vmtl::sparse_matrix< std::string > * __m) [inline]

This method assigns a sparse_matrix<string>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<string>.

Definition at line 1028 of file search_graph.cc.

10.22.3.106 basic_alltype& coco::coco::coco::basic_alltype::set_dm (vmtl::dense_matrix< double > * __m) [inline]

This method assigns a dense_matrix<double>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<double>.

Definition at line 940 of file search_graph.cc.

10.22.3.107 basic_alltype& coco::coco::coco::basic_alltype::set_idm (vmtl::dense_matrix< interval > * __m) [inline]

This method assigns a dense_matrix<interval>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<interval>.

Definition at line 962 of file search_graph.cc.

10.22.3.108 basic_alltype& coco::coco::coco::basic_alltype::set_ism (vmtl::sparse_matrix< interval > * __m) [inline]

This method assigns a sparse_matrix<interval>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<interval>.

Definition at line 1017 of file search_graph.cc.

10.22.3.109 basic_alltype& coco::coco::coco::basic_alltype::set_ndm (vmtl::dense_matrix< int > * __m) [inline]

This method assigns a dense_matrix<int>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<int>.

Definition at line 951 of file search_graph.cc.

10.22.3.110 basic_alltype& coco::coco::coco::basic_alltype::set_nsm (vmtl::sparse_matrix< int > * __m) [inline]

This method assigns a sparse_matrix<int>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<int>.

Definition at line 1006 of file search_graph.cc.

10.22.3.111 basic_alltype& coco::coco::coco::basic_alltype::set_sm (vmtl::sparse_matrix< double > * __m) [inline]

This method assigns a sparse_matrix<double>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<double>.

Definition at line 995 of file search_graph.cc.

10.22.3.112 basic_alltype& coco::coco::coco::basic_alltype::set_xdm (vmtl::dense_matrix< num::Number > * __m) [inline]

This method assigns a dense_matrix<Number>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<Number>.

Definition at line 984 of file search_graph.cc.

10.22.3.113 basic_alltype& coco::coco::coco::basic_alltype::set_xsm (vmtl::sparse_matrix< num::Number > * __m) [inline]

This method assigns a sparse_matrix<Number>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<Number>.

Definition at line 1039 of file search_graph.cc.

10.22.3.114 const vmtl::sparse_vector<interval>& coco::coco::coco::basic_alltype::si ( ) const [inline]

retrieve a sparse_vector<interval> from the basic_alltype

Definition at line 1276 of file search_graph.cc.

10.22.3.115 vmtl::sparse_vector<interval>& coco::coco::coco::basic_alltype::si ( ) [inline]

retrieve a sparse_vector<interval> from the basic_alltype

Definition at line 1547 of file search_graph.cc.

10.22.3.116 const vmtl::sparse_matrix<double>& coco::coco::coco::basic_alltype::sm ( ) const [inline]

retrieve a sparse_matrix<double> from the basic_alltype

Definition at line 1305 of file search_graph.cc.

10.22.3.117 vmtl::sparse_matrix<double>& coco::coco::coco::basic_alltype::sm ( ) [inline]

retrieve a sparse_matrix<double> from the basic_alltype

Definition at line 1576 of file search_graph.cc.

10.22.3.118 const vmtl::sparse_vector<int>& coco::coco::coco::basic_alltype::sn ( ) const [inline]

retrieve a sparse_vector<int> from the basic_alltype

Definition at line 1228 of file search_graph.cc.

10.22.3.119 vmtl::sparse_vector<int>& coco::coco::coco::basic_alltype::sn ( ) [inline]

retrieve a sparse_vector<int> from the basic_alltype

Definition at line 1499 of file search_graph.cc.

10.22.3.120 const vmtl::sparse_vector<unsigned int>& coco::coco::coco::basic_alltype::su ( ) const [inline]

retrieve a sparse_vector<unsigned int> from the basic_alltype

Definition at line 1250 of file search_graph.cc.

10.22.3.121 vmtl::sparse_vector<unsigned int>& coco::coco::coco::basic_alltype::su ( ) [inline]

retrieve a sparse_vector<unsigned int> from the basic_alltype

Definition at line 1521 of file search_graph.cc.

10.22.3.122 const vmtl::sparse_vector<num::Number>& coco::coco::coco::basic_alltype::sx ( ) const [inline]

retrieve a sparse_vector<Number> from the basic_alltype

Definition at line 1284 of file search_graph.cc.

10.22.3.123 vmtl::sparse_vector<num::Number>& coco::coco::coco::basic_alltype::sx ( ) [inline]

retrieve a sparse_vector<Number> from the basic_alltype

Definition at line 1555 of file search_graph.cc.

10.22.3.124 const char* coco::coco::coco::basic_alltype::type_cstr ( ) const [inline]

Return the type of the value contained in the storage as a C-string

Definition at line 1674 of file search_graph.cc.

10.22.3.125 std::string coco::coco::coco::basic_alltype::type_name ( ) const [inline]

Return the type of the value contained in the storage as a C++-string

Definition at line 1671 of file search_graph.cc.

10.22.3.126 const std::vector<unsigned int>& coco::coco::coco::basic_alltype::u ( ) const [inline]

retrieve a vector<unsigned int> from the basic_alltype

Definition at line 1111 of file search_graph.cc.

10.22.3.127 std::vector<unsigned int>& coco::coco::coco::basic_alltype::u ( ) [inline]

retrieve a vector<unsigned int> from the basic_alltype

Definition at line 1383 of file search_graph.cc.

10.22.3.128 const std::vector<std::vector<bool> >& coco::coco::coco::basic_alltype::vb ( ) const [inline]

retrieve a vector<vector<bool> > from the basic_alltype

Definition at line 1150 of file search_graph.cc.

10.22.3.129 std::vector<std::vector<bool> >& coco::coco::coco::basic_alltype::vb ( ) [inline]

retrieve a vector<vector<bool> > from the basic_alltype

Definition at line 1422 of file search_graph.cc.

10.22.3.130 const std::vector<std::vector<std::string> >& coco::coco::coco::basic_alltype::vc ( ) const [inline]

retrieve a vector<vector<string> > from the basic_alltype

Definition at line 1214 of file search_graph.cc.

10.22.3.131 std::vector<std::vector<std::string> >& coco::coco::coco::basic_alltype::vc ( ) [inline]

retrieve a vector<vector<string> > from the basic_alltype

Definition at line 1486 of file search_graph.cc.

10.22.3.132 const std::vector<std::vector<double> >& coco::coco::coco::basic_alltype::vd ( ) const [inline]

retrieve a vector<vector<double> > from the basic_alltype

Definition at line 1206 of file search_graph.cc.

10.22.3.133 std::vector<std::vector<double> >& coco::coco::coco::basic_alltype::vd ( ) [inline]

retrieve a vector<vector<double> > from the basic_alltype

Definition at line 1478 of file search_graph.cc.

10.22.3.134 const std::vector<std::vector<interval> >& coco::coco::coco::basic_alltype::vi ( ) const [inline]

retrieve a vector<vector<interval> > from the basic_alltype

Definition at line 1210 of file search_graph.cc.

10.22.3.135 std::vector<std::vector<interval> >& coco::coco::coco::basic_alltype::vi ( ) [inline]

retrieve a vector<vector<interval> > from the basic_alltype

Definition at line 1482 of file search_graph.cc.

10.22.3.136 const std::vector<std::vector<int> >& coco::coco::coco::basic_alltype::vn ( ) const [inline]

retrieve a vector<vector<int> > from the basic_alltype

Definition at line 1154 of file search_graph.cc.

10.22.3.137 std::vector<std::vector<int> >& coco::coco::coco::basic_alltype::vn ( ) [inline]

retrieve a vector<vector<int> > from the basic_alltype

Definition at line 1426 of file search_graph.cc.

10.22.3.138 const std::vector<std::vector<unsigned int> >& coco::coco::coco::basic_alltype::vu ( ) const [inline]

retrieve a vector<vector<unsigned int> > from the basic_alltype

Definition at line 1180 of file search_graph.cc.

10.22.3.139 std::vector<std::vector<unsigned int> >& coco::coco::coco::basic_alltype::vu ( ) [inline]

retrieve a vector<vector<unsigned int> > from the basic_alltype

Definition at line 1452 of file search_graph.cc.

10.22.3.140 const std::vector<std::vector<num::Number> >& coco::coco::coco::basic_alltype::vx ( ) const [inline]

retrieve a vector<vector<Number> > from the basic_alltype

Definition at line 1218 of file search_graph.cc.

10.22.3.141 std::vector<std::vector<num::Number> >& coco::coco::coco::basic_alltype::vx ( ) [inline]

retrieve a vector<vector<Number> > from the basic_alltype

Definition at line 1490 of file search_graph.cc.

10.22.3.142 const std::vector<num::Number>& coco::coco::coco::basic_alltype::x ( ) const [inline]

retrieve a vector<Number> from the basic_alltype

Definition at line 1145 of file search_graph.cc.

10.22.3.143 std::vector<num::Number>& coco::coco::coco::basic_alltype::x ( ) [inline]

retrieve a vector<Number> from the basic_alltype

Definition at line 1417 of file search_graph.cc.

10.22.3.144 const vmtl::dense_matrix<num::Number>& coco::coco::coco::basic_alltype::xdm ( ) const [inline]

retrieve a dense_matrix<Number> from the basic_alltype

Definition at line 1301 of file search_graph.cc.

10.22.3.145 vmtl::dense_matrix<num::Number>& coco::coco::coco::basic_alltype::xdm ( ) [inline]

retrieve a dense_matrix<Number> from the basic_alltype

Definition at line 1572 of file search_graph.cc.

10.22.3.146 const vmtl::sparse_matrix<num::Number>& coco::coco::coco::basic_alltype::xsm ( ) const [inline]

retrieve a sparse_matrix<Number> from the basic_alltype

Definition at line 1317 of file search_graph.cc.

10.22.3.147 vmtl::sparse_matrix<num::Number>& coco::coco::coco::basic_alltype::xsm ( ) [inline]

retrieve a sparse_matrix<Number> from the basic_alltype

Definition at line 1588 of file search_graph.cc.

10.22.3.148 const num::Number& coco::coco::coco::basic_alltype::y ( ) const [inline]

retrieve a Number from the basic_alltype

Definition at line 1082 of file search_graph.cc.

10.22.3.149 num::Number& coco::coco::coco::basic_alltype::y ( ) [inline]

retrieve a Number from the basic_alltype

Definition at line 1354 of file search_graph.cc.

10.23.1 Detailed Description

This class is the base of the data handling in the API. It can hold values of different types: bool, int, unsigned int, double, interval, string, Number, vector<bool>, vector<int>, vector<unsigned int>, vector<double>, vector<interval>, vector<string>, vector<Number>, sparse_vector<bool>, sparse_vector<int>, sparse_vector<unsigned int>, sparse_vector<double>, sparse_vector<interval>, sparse_vector<string>, sparse_vector<Number>, dense_matrix<double>, dense_matrix<int>, dense_matrix<interval>, dense_matrix<string>, dense_matrix<Number>, sparse_matrix<double>, sparse_matrix<int>, sparse_matrix<interval>, sparse_matrix<string>, sparse_matrix<Number>. All of these types can be stored and retrieved conveniently.

10.23.2 Constructor & Destructor Documentation

10.23.2.1 coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file basic_alltype.h.

10.23.2.2 coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool ___x

Definition at line 482 of file basic_alltype.h.

10.23.2.3 coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int ___x

Definition at line 485 of file basic_alltype.h.

10.23.2.4 coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int ___x

Definition at line 488 of file basic_alltype.h.

10.23.2.5 coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double ___x

Definition at line 491 of file basic_alltype.h.

10.23.2.6 coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval ___x

Definition at line 494 of file basic_alltype.h.

10.23.2.7 coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file basic_alltype.h.

10.23.2.8 coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file basic_alltype.h.

10.23.2.9 coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file basic_alltype.h.

10.23.2.10 coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number ___y

Definition at line 506 of file basic_alltype.h.

10.23.2.11 coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> ___x

Definition at line 510 of file basic_alltype.h.

10.23.2.12 coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> ___x

Definition at line 514 of file basic_alltype.h.

10.23.2.13 coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> ___x

Definition at line 518 of file basic_alltype.h.

10.23.2.14 coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> ___x

Definition at line 522 of file basic_alltype.h.

10.23.2.15 coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> __x

Definition at line 526 of file basic_alltype.h.

10.23.2.16 coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> __x

Definition at line 530 of file basic_alltype.h.

10.23.2.17 coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> __x

Definition at line 534 of file basic_alltype.h.

10.23.2.18 coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file basic_alltype.h.

10.23.2.19 coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file basic_alltype.h.

10.23.2.20 coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file basic_alltype.h.

10.23.2.21 coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file basic_alltype.h.

10.23.2.22 coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file basic_alltype.h.

10.23.2.23 coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file basic_alltype.h.

10.23.2.24 coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file basic_alltype.h.

10.23.2.25 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file basic_alltype.h.

10.23.2.26 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file basic_alltype.h.

10.23.2.27 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file basic_alltype.h.

10.23.2.28 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file basic_alltype.h.

10.23.2.29 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file basic_alltype.h.

10.23.2.30 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file basic_alltype.h.

10.23.2.31 coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file basic_alltype.h.

10.23.2.32 coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file basic_alltype.h.

10.23.2.33 coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file basic_alltype.h.

10.23.2.34 coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file basic_alltype.h.

10.23.2.35 coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file basic_alltype.h.

10.23.2.36 coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file basic_alltype.h.

10.23.2.37 coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file basic_alltype.h.

10.23.2.38 coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file basic_alltype.h.

10.23.2.39 coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file basic_alltype.h.

10.23.2.40 coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> ___x

Definition at line 630 of file basic_alltype.h.

10.23.2.41 coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> ___x

Definition at line 634 of file basic_alltype.h.

10.23.2.42 coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file basic_alltype.h.

10.23.2.43 coco::basic_alltype::basic_alltype (const basic_alltype & __a) [inline]

Standard Copy Constructor

Definition at line 643 of file basic_alltype.h.

10.23.3 Member Function Documentation

10.23.3.1 const std::vector<bool>& coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file basic_alltype.h.

10.23.3.2 std::vector<bool>& coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file basic_alltype.h.

10.23.3.3 const std::vector<std::string>& coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file basic_alltype.h.

10.23.3.4 std::vector<std::string>& coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file basic_alltype.h.

10.23.3.5 const vmtl::dense_matrix<std::string>& coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file basic_alltype.h.

10.23.3.6 vmtl::dense_matrix<std::string>& coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file basic_alltype.h.

10.23.3.7 basic_alltype& coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file basic_alltype.h.

10.23.3.8 int coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file basic_alltype.h.

10.23.3.9 const vmtl::sparse_matrix<std::string>& coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file basic_alltype.h.

10.23.3.10 vmtl::sparse_matrix<std::string>& coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file basic_alltype.h.

10.23.3.11 const std::vector<double>& coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file basic_alltype.h.

10.23.3.12 std::vector<double>& coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file basic_alltype.h.

10.23.3.13 const vmtl::dense_matrix<double>& coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file basic_alltype.h.

10.23.3.14 vmtl::dense_matrix<double>& coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file basic_alltype.h.

10.23.3.15 bool coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file basic_alltype.h.

10.23.3.16 const std::vector<interval>& coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file basic_alltype.h.

10.23.3.17 std::vector<interval>& coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file basic_alltype.h.

10.23.3.18 const vmtl::dense_matrix<interval>& coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file basic_alltype.h.

10.23.3.19 vmtl::dense_matrix<interval>& coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file basic_alltype.h.

10.23.3.20 bool coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file basic_alltype.h.

10.23.3.21 bool coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file basic_alltype.h.

10.23.3.22 bool coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file basic_alltype.h.

10.23.3.23 bool coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file basic_alltype.h.

10.23.3.24 bool coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file basic_alltype.h.

10.23.3.25 bool coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file basic_alltype.h.

10.23.3.26 bool coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file basic_alltype.h.

10.23.3.27 bool coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file basic_alltype.h.

10.23.3.28 bool coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file basic_alltype.h.

10.23.3.29 bool coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file basic_alltype.h.

10.23.3.30 bool coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file basic_alltype.h.

10.23.3.31 const vmtl::sparse_matrix<interval>& coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file basic_alltype.h.

10.23.3.32 vmtl::sparse_matrix<interval>& coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file basic_alltype.h.

10.23.3.33 bool coco::basic_alltype::less_equal (const basic_alltype & *b*) const

Total order comparison operator

10.23.3.34 bool coco::basic_alltype::less_than (const basic_alltype & *b*) const

Total order comparison operator

10.23.3.35 const std::vector<int>& coco::basic_alltype::n ( ) const [inline]

retrieve a vector<int> from the basic_alltype

Definition at line 1089 of file basic_alltype.h.

10.23.3.36 std::vector<int>& coco::basic_alltype::n ( ) [inline]

retrieve a vector<int> from the basic_alltype

Definition at line 1361 of file basic_alltype.h.

10.23.3.37 bool coco::basic_alltype::nb ( ) const [inline]

retrieve a bool from the basic_alltype

Definition at line 1049 of file basic_alltype.h.

10.23.3.38 bool& coco::basic_alltype::nb ( ) [inline]

retrieve a bool from the basic_alltype

Definition at line 1321 of file basic_alltype.h.

10.23.3.39 double coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file basic_alltype.h.

10.23.3.40 double& coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file basic_alltype.h.

10.23.3.41 const vmtl::dense_matrix<int>& coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file basic_alltype.h.

10.23.3.42 vmtl::dense_matrix<int>& coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file basic_alltype.h.

10.23.3.43 interval coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file basic_alltype.h.

10.23.3.44 interval_st& coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file basic_alltype.h.

10.23.3.45 int coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file basic_alltype.h.

10.23.3.46 int& coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file basic_alltype.h.

10.23.3.47 const vmtl::sparse_matrix<int>& coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file basic_alltype.h.

10.23.3.48 vmtl::sparse_matrix<int>& coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file basic_alltype.h.

10.23.3.49 unsigned int coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file basic_alltype.h.

10.23.3.50 unsigned int& coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file basic_alltype.h.

10.23.3.51 bool coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

10.23.3.52 basic_alltype& coco::basic_alltype::operator= (bool *__x*) [inline]

Assignment Operator, assigning the bool value ___x

Definition at line 647 of file basic_alltype.h.

10.23.3.53 basic_alltype& coco::basic_alltype::operator= (int *__x*) [inline]

Assignment Operator, assigning the int value ___x

Definition at line 653 of file basic_alltype.h.

10.23.3.54 basic_alltype& coco::basic_alltype::operator= (unsigned int *__x*) [inline]

Assignment Operator, assigning the unsigned int value ___x

Definition at line 659 of file basic_alltype.h.

10.23.3.55 basic_alltype& coco::basic_alltype::operator= (double *__x*) [inline]

Assignment Operator, assigning the double value ___x

Definition at line 665 of file basic_alltype.h.

10.23.3.56 basic_alltype& coco::basic_alltype::operator= (interval *__x*) [inline]

Assignment Operator, assigning the interval value ___x

Definition at line 671 of file basic_alltype.h.

10.23.3.57 basic_alltype& coco::basic_alltype::operator= (void * *__x*) [inline]

Assignment Operator, assigning the void* value ___x

Definition at line 677 of file basic_alltype.h.

10.23.3.58 basic_alltype& coco::basic_alltype::operator= (const std::string & *__x*) [inline]

Assignment Operator, assigning the string value ___x

Definition at line 683 of file basic_alltype.h.

10.23.3.59 basic_alltype& coco::basic_alltype::operator= (const char * *__x*) [inline]

Assignment Operator, assigning the string value ___x

Definition at line 690 of file basic_alltype.h.

10.23.3.60 basic_alltype& coco::basic_alltype::operator= (const num::Number & *__x*) [inline]

Assignment Operator, assigning the Number value ___x

Definition at line 697 of file basic_alltype.h.

10.23.3.61 basic_alltype& coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value ___x

Definition at line 704 of file basic_alltype.h.

10.23.3.62 basic_alltype& coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value ___x

Definition at line 711 of file basic_alltype.h.

10.23.3.63 basic_alltype& coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value ___x

Definition at line 718 of file basic_alltype.h.

10.23.3.64 basic_alltype& coco::basic_alltype::operator= (const std::vector< double > & __x) [inline]

Assignment Operator, assigning the vector<double> value ___x

Definition at line 725 of file basic_alltype.h.

10.23.3.65 basic_alltype& coco::basic_alltype::operator= (const std::vector< interval > & __x) [inline]

Assignment Operator, assigning the vector<interval> value ___x

Definition at line 732 of file basic_alltype.h.

10.23.3.66 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::string > & __x) [inline]

Assignment Operator, assigning the vector<string> value ___x

Definition at line 739 of file basic_alltype.h.

10.23.3.67 basic_alltype& coco::basic_alltype::operator= (const std::vector< num::Number > & __x) [inline]

Assignment Operator, assigning the vector<Number> value ___x

Definition at line 746 of file basic_alltype.h.

10.23.3.68 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< bool > > & __x) [inline]

Assignment Operator, assigning the vector<vector<bool> > value ___x

Definition at line 753 of file basic_alltype.h.

10.23.3.69 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value ___x

Definition at line 760 of file basic_alltype.h.

10.23.3.70 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value ___x

Definition at line 767 of file basic_alltype.h.

10.23.3.71 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value ___x

Definition at line 774 of file basic_alltype.h.

10.23.3.72 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value ___x

Definition at line 781 of file basic_alltype.h.

10.23.3.73 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value ___x

Definition at line 788 of file basic_alltype.h.

10.23.3.74 basic_alltype& coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value ___x

Definition at line 795 of file basic_alltype.h.

10.23.3.75 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value ___x

Definition at line 802 of file basic_alltype.h.

10.23.3.76 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value ___x

Definition at line 809 of file basic_alltype.h.

10.23.3.77 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file basic_alltype.h.

10.23.3.78 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file basic_alltype.h.

10.23.3.79 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file basic_alltype.h.

10.23.3.80 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file basic_alltype.h.

10.23.3.81 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file basic_alltype.h.

10.23.3.82 basic_alltype& coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file basic_alltype.h.

10.23.3.83 basic_alltype& coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file basic_alltype.h.

10.23.3.84 basic_alltype& coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file basic_alltype.h.

10.23.3.85 basic_alltype& coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file basic_alltype.h.

10.23.3.86 basic_alltype& coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file basic_alltype.h.

10.23.3.87 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_matrix< double > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<double> value __x

Definition at line 886 of file basic_alltype.h.

10.23.3.88 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_matrix< int > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<int> value __x

Definition at line 893 of file basic_alltype.h.

10.23.3.89 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_matrix< interval > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<interval> value __x

Definition at line 900 of file basic_alltype.h.

10.23.3.90 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<string> value __x

Definition at line 907 of file basic_alltype.h.

10.23.3.91 basic_alltype& coco::basic_alltype::operator= (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_matrix<Number> value __x

Definition at line 914 of file basic_alltype.h.

10.23.3.92 basic_alltype& coco::basic_alltype::operator= (const basic_alltype & __a) [inline]

Standard Assignment Operator

Definition at line 921 of file basic_alltype.h.

10.23.3.93 bool coco::basic_alltype::operator== (const basic_alltype & *b*) const

Standard comparison operator

10.23.3.94 const void* coco::basic_alltype::p ( ) const [inline]

retrieve a void* from the basic_alltype

Definition at line 1076 of file basic_alltype.h.

10.23.3.95 void*& coco::basic_alltype::p ( ) [inline]

retrieve a void* reference from the basic_alltype

Definition at line 1348 of file basic_alltype.h.

10.23.3.96 const std::string& coco::basic_alltype::s ( ) const [inline]

retrieve a string from the basic_alltype

Definition at line 1079 of file basic_alltype.h.

10.23.3.97 std::string& coco::basic_alltype::s ( ) [inline]

retrieve a string from the basic_alltype

Definition at line 1351 of file basic_alltype.h.

10.23.3.98 const vmtl::sparse_vector<bool>& coco::basic_alltype::sb ( ) const [inline]

retrieve a sparse_vector<bool> from the basic_alltype

Definition at line 1224 of file basic_alltype.h.

10.23.3.99 vmtl::sparse_vector<bool>& coco::basic_alltype::sb ( ) [inline]

retrieve a sparse_vector<bool> from the basic_alltype

Definition at line 1495 of file basic_alltype.h.

10.23.3.100 const vmtl::sparse_vector<std::string>& coco::basic_alltype::sc ( ) const [inline]

retrieve a sparse_vector<string> from the basic_alltype

Definition at line 1280 of file basic_alltype.h.

10.23.3.101 vmtl::sparse_vector<std::string>& coco::basic_alltype::sc ( ) [inline]

retrieve a sparse_vector<string> from the basic_alltype

Definition at line 1551 of file basic_alltype.h.

10.23.3.102 const vmtl::sparse_vector<double>& coco::basic_alltype::sd ( ) const [inline]

retrieve a sparse_vector<double> from the basic_alltype

Definition at line 1272 of file basic_alltype.h.

10.23.3.103 vmtl::sparse_vector<double>& coco::basic_alltype::sd ( ) [inline]

retrieve a sparse_vector<double> from the basic_alltype

Definition at line 1543 of file basic_alltype.h.

10.23.3.104 basic_alltype& coco::basic_alltype::set_cdm (vmtl::dense_matrix< std::string > * __m) [inline]

This method assigns a dense_matrix<string>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<string>.

Definition at line 973 of file basic_alltype.h.

10.23.3.105 basic_alltype& coco::basic_alltype::set_csm (vmtl::sparse_matrix< std::string > * __m) [inline]

This method assigns a sparse_matrix<string>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<string>.

Definition at line 1028 of file basic_alltype.h.

10.23.3.106 basic_alltype& coco::basic_alltype::set_dm (vmtl::dense_matrix< double > * __m) [inline]

This method assigns a dense_matrix<double>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<double>.

Definition at line 940 of file basic_alltype.h.

10.23.3.107 basic_alltype& coco::basic_alltype::set_idm (vmtl::dense_matrix< interval > * __m) [inline]

This method assigns a dense_matrix<interval>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<interval>.

Definition at line 962 of file basic_alltype.h.

10.23.3.108 basic_alltype& coco::basic_alltype::set_ism (vmtl::sparse_matrix< interval > * __m) [inline]

This method assigns a sparse_matrix<interval>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<interval>.

Definition at line 1017 of file basic_alltype.h.

10.23.3.109 basic_alltype& coco::basic_alltype::set_ndm (vmtl::dense_matrix< int > * __m) [inline]

This method assigns a dense_matrix<int>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<int>.

Definition at line 951 of file basic_alltype.h.

10.23.3.110 basic_alltype& coco::basic_alltype::set_nsm (vmtl::sparse_matrix< int > * __m) [inline]

This method assigns a sparse_matrix<int>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<int>.

Definition at line 1006 of file basic_alltype.h.

10.23.3.111 basic_alltype& coco::basic_alltype::set_sm (vmtl::sparse_matrix< double > * __m) [inline]

This method assigns a sparse_matrix<double>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<double>.

Definition at line 995 of file basic_alltype.h.

10.23.3.112 basic_alltype& coco::basic_alltype::set_xdm (vmtl::dense_matrix< num::Number > * __m) [inline]

This method assigns a dense_matrix<Number>* to the basic alltype. This method must not be used unless __m was allocated by new dense_matrix<Number>.

Definition at line 984 of file basic_alltype.h.

10.23.3.113 basic_alltype& coco::basic_alltype::set_xsm (vmtl::sparse_matrix< num::Number > * __m) [inline]

This method assigns a sparse_matrix<Number>* to the basic alltype. This method must not be used unless __m was allocated by new sparse_matrix<Number>.

Definition at line 1039 of file basic_alltype.h.

10.23.3.114 const vmtl::sparse_vector<interval>& coco::basic_alltype::si ( ) const [inline]

retrieve a sparse_vector<interval> from the basic_alltype

Definition at line 1276 of file basic_alltype.h.

10.23.3.115 vmtl::sparse_vector<interval>& coco::basic_alltype::si ( ) [inline]

retrieve a sparse_vector<interval> from the basic_alltype

Definition at line 1547 of file basic_alltype.h.

10.23.3.116 const vmtl::sparse_matrix<double>& coco::basic_alltype::sm ( ) const [inline]

retrieve a sparse_matrix<double> from the basic_alltype

Definition at line 1305 of file basic_alltype.h.

10.23.3.117 vmtl::sparse_matrix<double>& coco::basic_alltype::sm ( ) [inline]

retrieve a sparse_matrix<double> from the basic_alltype

Definition at line 1576 of file basic_alltype.h.

10.23.3.118 const vmtl::sparse_vector<int>& coco::basic_alltype::sn ( ) const [inline]

retrieve a sparse_vector<int> from the basic_alltype

Definition at line 1228 of file basic_alltype.h.

10.23.3.119 vmtl::sparse_vector<int>& coco::basic_alltype::sn ( ) [inline]

retrieve a sparse_vector<int> from the basic_alltype

Definition at line 1499 of file basic_alltype.h.

10.23.3.120 const vmtl::sparse_vector<unsigned int>& coco::basic_alltype::su ( ) const [inline]

retrieve a sparse_vector<unsigned int> from the basic_alltype

Definition at line 1250 of file basic_alltype.h.

10.23.3.121 vmtl::sparse_vector<unsigned int>& coco::basic_alltype::su ( ) [inline]

retrieve a sparse_vector<unsigned int> from the basic_alltype

Definition at line 1521 of file basic_alltype.h.

10.23.3.122 const vmtl::sparse_vector<num::Number>& coco::basic_alltype::sx ( ) const [inline]

retrieve a sparse_vector<Number> from the basic_alltype

Definition at line 1284 of file basic_alltype.h.

10.23.3.123 vmtl::sparse_vector<num::Number>& coco::basic_alltype::sx ( ) [inline]

retrieve a sparse_vector<Number> from the basic_alltype

Definition at line 1555 of file basic_alltype.h.

10.23.3.124 const char* coco::basic_alltype::type_cstr ( ) const [inline]

Return the type of the value contained in the storage as a C-string

Definition at line 1674 of file basic_alltype.h.

10.23.3.125 std::string coco::basic_alltype::type_name ( ) const [inline]

Return the type of the value contained in the storage as a C++-string

Definition at line 1671 of file basic_alltype.h.

10.23.3.126 const std::vector<unsigned int>& coco::basic_alltype::u ( ) const [inline]

retrieve a vector<unsigned int> from the basic_alltype

Definition at line 1111 of file basic_alltype.h.

10.23.3.127 std::vector<unsigned int>& coco::basic_alltype::u ( ) [inline]

retrieve a vector<unsigned int> from the basic_alltype

Definition at line 1383 of file basic_alltype.h.

10.23.3.128 const std::vector<std::vector<bool> >& coco::basic_alltype::vb ( ) const [inline]

retrieve a vector<vector<bool> > from the basic_alltype

Definition at line 1150 of file basic_alltype.h.

10.23.3.129 std::vector<std::vector<bool> >& coco::basic_alltype::vb ( ) [inline]

retrieve a vector<vector<bool> > from the basic_alltype

Definition at line 1422 of file basic_alltype.h.

10.23.3.130 const std::vector<std::vector<std::string> >& coco::basic_alltype::vc ( ) const [inline]

retrieve a vector<vector<string> > from the basic_alltype

Definition at line 1214 of file basic_alltype.h.

10.23.3.131 std::vector<std::vector<std::string> >& coco::basic_alltype::vc ( ) [inline]

retrieve a vector<vector<string> > from the basic_alltype

Definition at line 1486 of file basic_alltype.h.

10.23.3.132 const std::vector<std::vector<double> >& coco::basic_alltype::vd ( ) const [inline]

retrieve a vector<vector<double> > from the basic_alltype

Definition at line 1206 of file basic_alltype.h.

10.23.3.133 std::vector<std::vector<double> >& coco::basic_alltype::vd ( ) [inline]

retrieve a vector<vector<double> > from the basic_alltype

Definition at line 1478 of file basic_alltype.h.

10.23.3.134 const std::vector<std::vector<interval> >& coco::basic_alltype::vi ( ) const [inline]

retrieve a vector<vector<interval> > from the basic_alltype

Definition at line 1210 of file basic_alltype.h.

10.23.3.135 std::vector<std::vector<interval> >& coco::basic_alltype::vi ( ) [inline]

retrieve a vector<vector<interval> > from the basic_alltype

Definition at line 1482 of file basic_alltype.h.

10.23.3.136 const std::vector<std::vector<int> >& coco::basic_alltype::vn ( ) const [inline]

retrieve a vector<vector<int> > from the basic_alltype

Definition at line 1154 of file basic_alltype.h.

10.23.3.137 std::vector<std::vector<int> >& coco::basic_alltype::vn ( ) [inline]

retrieve a vector<vector<int> > from the basic_alltype

Definition at line 1426 of file basic_alltype.h.

10.23.3.138 const std::vector<std::vector<unsigned int> >& coco::basic_alltype::vu ( ) const [inline]

retrieve a vector<vector<unsigned int> > from the basic_alltype

Definition at line 1180 of file basic_alltype.h.

10.23.3.139 std::vector<std::vector<unsigned int> >& coco::basic_alltype::vu ( ) [inline]

retrieve a vector<vector<unsigned int> > from the basic_alltype

Definition at line 1452 of file basic_alltype.h.

10.23.3.140 const std::vector<std::vector<num::Number> >& coco::basic_alltype::vx ( ) const [inline]

retrieve a vector<vector<Number> > from the basic_alltype

Definition at line 1218 of file basic_alltype.h.

10.23.3.141 std::vector<std::vector<num::Number> >& coco::basic_alltype::vx ( ) [inline]

retrieve a vector<vector<Number> > from the basic_alltype

Definition at line 1490 of file basic_alltype.h.

10.23.3.142 const std::vector<num::Number>& coco::basic_alltype::x ( ) const [inline]

retrieve a vector<Number> from the basic_alltype

Definition at line 1145 of file basic_alltype.h.

10.23.3.143 std::vector<num::Number>& coco::basic_alltype::x ( ) [inline]

retrieve a vector<Number> from the basic_alltype

Definition at line 1417 of file basic_alltype.h.

10.23.3.144 const vmtl::dense_matrix<num::Number>& coco::basic_alltype::xdm ( ) const [inline]

retrieve a dense_matrix<Number> from the basic_alltype

Definition at line 1301 of file basic_alltype.h.

10.23.3.145 vmtl::dense_matrix<num::Number>& coco::basic_alltype::xdm ( ) [inline]

retrieve a dense_matrix<Number> from the basic_alltype

Definition at line 1572 of file basic_alltype.h.

10.23.3.146 const vmtl::sparse_matrix<num::Number>& coco::basic_alltype::xsm ( ) const [inline]

retrieve a sparse_matrix<Number> from the basic_alltype

Definition at line 1317 of file basic_alltype.h.

10.23.3.147 vmtl::sparse_matrix<num::Number>& coco::basic_alltype::xsm ( ) [inline]

retrieve a sparse_matrix<Number> from the basic_alltype

Definition at line 1588 of file basic_alltype.h.

10.23.3.148 const num::Number& coco::basic_alltype::y ( ) const [inline]

retrieve a Number from the basic_alltype

Definition at line 1082 of file basic_alltype.h.

10.23.3.149 num::Number& coco::basic_alltype::y ( ) [inline]

retrieve a Number from the basic_alltype

Definition at line 1354 of file basic_alltype.h.

10.24.1 Detailed Description

This class is the base of the data handling in the API. It can hold values of different types: bool, int, unsigned int, double, interval, string, Number, vector<bool>, vector<int>, vector<unsigned int>, vector<double>, vector<interval>, vector<string>, vector<Number>, sparse_vector<bool>, sparse_vector<int>, sparse_vector<unsigned int>, sparse_vector<double>, sparse_vector<interval>, sparse_vector<string>, sparse_vector<Number>, dense_matrix<double>, dense_matrix<int>, dense_matrix<interval>, dense_matrix<string>, dense_matrix<Number>, sparse_matrix<double>, sparse_matrix<int>, sparse_matrix<interval>, sparse_matrix<string>, sparse_matrix<Number>. All of these types can be stored and retrieved conveniently.

Definition at line 175 of file search_graph.cc.

10.24.2 Constructor & Destructor Documentation

10.24.2.1 coco::coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file expression.h.

10.24.2.2 coco::coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool ___x

Definition at line 482 of file expression.h.

10.24.2.3 coco::coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int ___x

Definition at line 485 of file expression.h.

10.24.2.4 coco::coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int ___x

Definition at line 488 of file expression.h.

10.24.2.5 coco::coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double ___x

Definition at line 491 of file expression.h.

10.24.2.6 coco::coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval ___x

Definition at line 494 of file expression.h.

10.24.2.7 coco::coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file expression.h.

10.24.2.8 coco::coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file expression.h.

10.24.2.9 coco::coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file expression.h.

10.24.2.10 coco::coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number __y

Definition at line 506 of file expression.h.

10.24.2.11 coco::coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> __x

Definition at line 510 of file expression.h.

10.24.2.12 coco::coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> __x

Definition at line 514 of file expression.h.

10.24.2.13 coco::coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> __x

Definition at line 518 of file expression.h.

10.24.2.14 coco::coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> __x

Definition at line 522 of file expression.h.

10.24.2.15 coco::coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> __x

Definition at line 526 of file expression.h.

10.24.2.16 coco::coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> __x

Definition at line 530 of file expression.h.

10.24.2.17 coco::coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> __x

Definition at line 534 of file expression.h.

10.24.2.18 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file expression.h.

10.24.2.19 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file expression.h.

10.24.2.20 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file expression.h.

10.24.2.21 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file expression.h.

10.24.2.22 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file expression.h.

10.24.2.23 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file expression.h.

10.24.2.24 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file expression.h.

10.24.2.25 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file expression.h.

10.24.2.26 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file expression.h.

10.24.2.27 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file expression.h.

10.24.2.28 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file expression.h.

10.24.2.29 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file expression.h.

10.24.2.30 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file expression.h.

10.24.2.31 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file expression.h.

10.24.2.32 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file expression.h.

10.24.2.33 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file expression.h.

10.24.2.34 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file expression.h.

10.24.2.35 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file expression.h.

10.24.2.36 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file expression.h.

10.24.2.37 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file expression.h.

10.24.2.38 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file expression.h.

10.24.2.39 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file expression.h.

10.24.2.40 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> __x

Definition at line 630 of file expression.h.

10.24.2.41 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> __x

Definition at line 634 of file expression.h.

10.24.2.42 coco::coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file expression.h.

10.24.2.43 coco::coco::basic_alltype::basic_alltype (const basic_alltype & __a) [inline]

Standard Copy Constructor

Definition at line 643 of file expression.h.

10.24.2.44 coco::coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file search_graph.cc.

10.24.2.45 coco::coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool ___x

Definition at line 482 of file search_graph.cc.

10.24.2.46 coco::coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int ___x

Definition at line 485 of file search_graph.cc.

10.24.2.47 coco::coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int ___x

Definition at line 488 of file search_graph.cc.

10.24.2.48 coco::coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double ___x

Definition at line 491 of file search_graph.cc.

10.24.2.49 coco::coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval ___x

Definition at line 494 of file search_graph.cc.

10.24.2.50 coco::coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file search_graph.cc.

10.24.2.51 coco::coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file search_graph.cc.

10.24.2.52 coco::coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file search_graph.cc.

10.24.2.53 coco::coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number ___y

Definition at line 506 of file search_graph.cc.

10.24.2.54 coco::coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> ___x

Definition at line 510 of file search_graph.cc.

10.24.2.55 coco::coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> ___x

Definition at line 514 of file search_graph.cc.

10.24.2.56 coco::coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> ___x

Definition at line 518 of file search_graph.cc.

10.24.2.57 coco::coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> ___x

Definition at line 522 of file search_graph.cc.

10.24.2.58 coco::coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> ___x

Definition at line 526 of file search_graph.cc.

10.24.2.59 coco::coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> ___x

Definition at line 530 of file search_graph.cc.

10.24.2.60 coco::coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> ___x

Definition at line 534 of file search_graph.cc.

10.24.2.61 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file search_graph.cc.

10.24.2.62 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file search_graph.cc.

10.24.2.63 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file search_graph.cc.

10.24.2.64 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file search_graph.cc.

10.24.2.65 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file search_graph.cc.

10.24.2.66 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file search_graph.cc.

10.24.2.67 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file search_graph.cc.

10.24.2.68 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file search_graph.cc.

10.24.2.69 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file search_graph.cc.

10.24.2.70 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file search_graph.cc.

10.24.2.71 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file search_graph.cc.

10.24.2.72 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file search_graph.cc.

10.24.2.73 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file search_graph.cc.

10.24.2.74 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file search_graph.cc.

10.24.2.75 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file search_graph.cc.

10.24.2.76 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file search_graph.cc.

10.24.2.77 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file search_graph.cc.

10.24.2.78 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file search_graph.cc.

10.24.2.79 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file search_graph.cc.

10.24.2.80 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file search_graph.cc.

10.24.2.81 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file search_graph.cc.

10.24.2.82 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file search_graph.cc.

10.24.2.83 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> __x

Definition at line 630 of file search_graph.cc.

10.24.2.84 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> __x

Definition at line 634 of file search_graph.cc.

10.24.2.85 coco::coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file search_graph.cc.

10.24.2.86 coco::coco::basic_alltype::basic_alltype (const basic_alltype & __a) [inline]

Standard Copy Constructor

Definition at line 643 of file search_graph.cc.

10.24.2.87 coco::coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file search_graph.cc.

10.24.2.88 coco::coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool ___x

Definition at line 482 of file search_graph.cc.

10.24.2.89 coco::coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int ___x

Definition at line 485 of file search_graph.cc.

10.24.2.90 coco::coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int ___x

Definition at line 488 of file search_graph.cc.

10.24.2.91 coco::coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double ___x

Definition at line 491 of file search_graph.cc.

10.24.2.92 coco::coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval ___x

Definition at line 494 of file search_graph.cc.

10.24.2.93 coco::coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file search_graph.cc.

10.24.2.94 coco::coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file search_graph.cc.

10.24.2.95 coco::coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file search_graph.cc.

10.24.2.96 coco::coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number ___y

Definition at line 506 of file search_graph.cc.

10.24.2.97 coco::coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> ___x

Definition at line 510 of file search_graph.cc.

10.24.2.98 coco::coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> ___x

Definition at line 514 of file search_graph.cc.

10.24.2.99 coco::coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> ___x

Definition at line 518 of file search_graph.cc.

10.24.2.100 coco::coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> ___x

Definition at line 522 of file search_graph.cc.

10.24.2.101 coco::coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> ___x

Definition at line 526 of file search_graph.cc.

10.24.2.102 coco::coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> ___x

Definition at line 530 of file search_graph.cc.

10.24.2.103 coco::coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> __x

Definition at line 534 of file search_graph.cc.

10.24.2.104 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file search_graph.cc.

10.24.2.105 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file search_graph.cc.

10.24.2.106 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file search_graph.cc.

10.24.2.107 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file search_graph.cc.

10.24.2.108 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file search_graph.cc.

10.24.2.109 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file search_graph.cc.

10.24.2.110 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file search_graph.cc.

10.24.2.111 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file search_graph.cc.

10.24.2.112 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file search_graph.cc.

10.24.2.113 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file search_graph.cc.

10.24.2.114 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file search_graph.cc.

10.24.2.115 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file search_graph.cc.

10.24.2.116 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file search_graph.cc.

10.24.2.117 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file search_graph.cc.

10.24.2.118 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file search_graph.cc.

10.24.2.119 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file search_graph.cc.

10.24.2.120 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file search_graph.cc.

10.24.2.121 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file search_graph.cc.

10.24.2.122 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file search_graph.cc.

10.24.2.123 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file search_graph.cc.

10.24.2.124 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file search_graph.cc.

10.24.2.125 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file search_graph.cc.

10.24.2.126 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> __x

Definition at line 630 of file search_graph.cc.

10.24.2.127 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> __x

Definition at line 634 of file search_graph.cc.

10.24.2.128 coco::coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file search_graph.cc.

10.24.2.129 coco::coco::basic_alltype::basic_alltype (const basic_alltype & __a) [inline]

Standard Copy Constructor

Definition at line 643 of file search_graph.cc.

10.24.2.130 coco::coco::basic_alltype::basic_alltype ( ) [inline]

Standard Constructor yielding an empty basic_alltype

Definition at line 480 of file search_graph.cc.

10.24.2.131 coco::coco::basic_alltype::basic_alltype (bool __x) [inline]

Constructor storing the bool __x

Definition at line 482 of file search_graph.cc.

10.24.2.132 coco::coco::basic_alltype::basic_alltype (int __x) [inline]

Constructor storing the int __x

Definition at line 485 of file search_graph.cc.

10.24.2.133 coco::coco::basic_alltype::basic_alltype (unsigned int __x) [inline]

Constructor storing the unsigned int __x

Definition at line 488 of file search_graph.cc.

10.24.2.134 coco::coco::basic_alltype::basic_alltype (double __x) [inline]

Constructor storing the double __x

Definition at line 491 of file search_graph.cc.

10.24.2.135 coco::coco::basic_alltype::basic_alltype (interval __x) [inline]

Constructor storing the interval __x

Definition at line 494 of file search_graph.cc.

10.24.2.136 coco::coco::basic_alltype::basic_alltype (void * __x) [inline]

Constructor storing the void* ___x

Definition at line 497 of file search_graph.cc.

10.24.2.137 coco::coco::basic_alltype::basic_alltype (const char * __cp) [inline]

Constructor storing the string ___cp

Definition at line 500 of file search_graph.cc.

10.24.2.138 coco::coco::basic_alltype::basic_alltype (const std::string & __x) [inline]

Constructor storing the string ___x

Definition at line 503 of file search_graph.cc.

10.24.2.139 coco::coco::basic_alltype::basic_alltype (const num::Number & __y) [inline]

Constructor storing the number ___y

Definition at line 506 of file search_graph.cc.

10.24.2.140 coco::coco::basic_alltype::basic_alltype (const std::vector< bool > & __x) [inline]

Constructor storing the vector<bool> ___x

Definition at line 510 of file search_graph.cc.

10.24.2.141 coco::coco::basic_alltype::basic_alltype (const std::vector< int > & __x) [inline]

Constructor storing the vector<int> ___x

Definition at line 514 of file search_graph.cc.

10.24.2.142 coco::coco::basic_alltype::basic_alltype (const std::vector< unsigned int > & __x) [inline]

Constructor storing the vector<unsigned int> ___x

Definition at line 518 of file search_graph.cc.

10.24.2.143 coco::coco::basic_alltype::basic_alltype (const std::vector< double > & __x) [inline]

Constructor storing the vector<double> ___x

Definition at line 522 of file search_graph.cc.

10.24.2.144 coco::coco::basic_alltype::basic_alltype (const std::vector< interval > & __x) [inline]

Constructor storing the vector<interval> ___x

Definition at line 526 of file search_graph.cc.

10.24.2.145 coco::coco::basic_alltype::basic_alltype (const std::vector< std::string > & __x) [inline]

Constructor storing the vector<string> __x

Definition at line 530 of file search_graph.cc.

10.24.2.146 coco::coco::basic_alltype::basic_alltype (const std::vector< num::Number > & __x) [inline]

Constructor storing the vector<Number> __x

Definition at line 534 of file search_graph.cc.

10.24.2.147 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< bool > > & __vx) [inline]

Constructor storing the vector<vector<bool> > __vx

Definition at line 539 of file search_graph.cc.

10.24.2.148 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< int > > & __vx) [inline]

Constructor storing the vector<vector<int> > __vx

Definition at line 543 of file search_graph.cc.

10.24.2.149 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< unsigned int > > & __vx) [inline]

Constructor storing the vector<vector<unsigned int> > __vx

Definition at line 547 of file search_graph.cc.

10.24.2.150 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< double > > & __vx) [inline]

Constructor storing the vector<vector<double> > __vx

Definition at line 551 of file search_graph.cc.

10.24.2.151 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< interval > > & __vx) [inline]

Constructor storing the vector<vector<interval> > __vx

Definition at line 555 of file search_graph.cc.

10.24.2.152 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< std::string > > & __vx) [inline]

Constructor storing the vector<vector<string> > __vx

Definition at line 559 of file search_graph.cc.

10.24.2.153 coco::coco::basic_alltype::basic_alltype (const std::vector< std::vector< num::Number > > & __vx) [inline]

Constructor storing the vector<vector<Number> > __vx

Definition at line 563 of file search_graph.cc.

10.24.2.154 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< bool > & __x) [inline]

Constructor storing the sparse_vector<bool> __x

Definition at line 568 of file search_graph.cc.

10.24.2.155 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< int > & __x) [inline]

Constructor storing the sparse_vector<int> __x

Definition at line 572 of file search_graph.cc.

10.24.2.156 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Constructor storing the sparse_vector<unsigned int> __x

Definition at line 576 of file search_graph.cc.

10.24.2.157 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< double > & __x) [inline]

Constructor storing the sparse_vector<double> __x

Definition at line 580 of file search_graph.cc.

10.24.2.158 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< interval > & __x) [inline]

Constructor storing the sparse_vector<interval> __x

Definition at line 584 of file search_graph.cc.

10.24.2.159 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< std::string > & __x) [inline]

Constructor storing the sparse_vector<string> __x

Definition at line 588 of file search_graph.cc.

10.24.2.160 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_vector< num::Number > & __x) [inline]

Constructor storing the sparse_vector<Number> __x

Definition at line 592 of file search_graph.cc.

10.24.2.161 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< double > & __x) [inline]

Constructor storing the dense_matrix<double> __x

Definition at line 597 of file search_graph.cc.

10.24.2.162 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< int > & __x) [inline]

Constructor storing the dense_matrix<int> __x

Definition at line 601 of file search_graph.cc.

10.24.2.163 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< interval > & __x) [inline]

Constructor storing the dense_matrix<interval> __x

Definition at line 605 of file search_graph.cc.

10.24.2.164 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< std::string > & __x) [inline]

Constructor storing the dense_matrix<string> __x

Definition at line 609 of file search_graph.cc.

10.24.2.165 coco::coco::basic_alltype::basic_alltype (const vmtl::dense_matrix< num::Number > & __x) [inline]

Constructor storing the dense_matrix<Number> __x

Definition at line 613 of file search_graph.cc.

10.24.2.166 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< double > & __x) [inline]

Constructor storing the sparse_matrix<double> __x

Definition at line 618 of file search_graph.cc.

10.24.2.167 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< int > & __x) [inline]

Constructor storing the sparse_matrix<int> __x

Definition at line 622 of file search_graph.cc.

10.24.2.168 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< interval > & __x) [inline]

Constructor storing the sparse_matrix<interval> __x

Definition at line 626 of file search_graph.cc.

10.24.2.169 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< std::string > & __x) [inline]

Constructor storing the sparse_matrix<string> __x

Definition at line 630 of file search_graph.cc.

10.24.2.170 coco::coco::basic_alltype::basic_alltype (const vmtl::sparse_matrix< num::Number > & __x) [inline]

Constructor storing the sparse_matrix<Number> __x

Definition at line 634 of file search_graph.cc.

10.24.2.171 coco::coco::basic_alltype::~basic_alltype ( ) [inline]

Standard Destructor

Definition at line 639 of file search_graph.cc.

10.24.2.172 coco::coco::basic_alltype::basic_alltype (const basic_alltype & __a) [inline]

Standard Copy Constructor

Definition at line 643 of file search_graph.cc.

10.24.3 Member Function Documentation

10.24.3.1 const std::vector<bool>& coco::coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file expression.h.

10.24.3.2 const std::vector<bool>& coco::coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file search_graph.cc.

10.24.3.3 const std::vector<bool>& coco::coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file search_graph.cc.

10.24.3.4 const std::vector<bool>& coco::coco::basic_alltype::b ( ) const [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1085 of file search_graph.cc.

10.24.3.5 std::vector<bool>& coco::coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file search_graph.cc.

10.24.3.6 std::vector<bool>& coco::coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file expression.h.

10.24.3.7 std::vector<bool>& coco::coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file search_graph.cc.

10.24.3.8 std::vector<bool>& coco::coco::basic_alltype::b ( ) [inline]

retrieve a vector<bool> from the basic_alltype

Definition at line 1357 of file search_graph.cc.

10.24.3.9 const std::vector<std::string>& coco::coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file search_graph.cc.

10.24.3.10 const std::vector<std::string>& coco::coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file expression.h.

10.24.3.11 const std::vector<std::string>& coco::coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file search_graph.cc.

10.24.3.12 const std::vector<std::string>& coco::coco::basic_alltype::c ( ) const [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1141 of file search_graph.cc.

10.24.3.13 std::vector<std::string>& coco::coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file search_graph.cc.

10.24.3.14 std::vector<std::string>& coco::coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file search_graph.cc.

10.24.3.15 std::vector<std::string>& coco::coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file expression.h.

10.24.3.16 std::vector<std::string>& coco::coco::basic_alltype::c ( ) [inline]

retrieve a vector<string> from the basic_alltype

Definition at line 1413 of file search_graph.cc.

10.24.3.17 const vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file search_graph.cc.

10.24.3.18 const vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file expression.h.

10.24.3.19 const vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file search_graph.cc.

10.24.3.20 const vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) const [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1298 of file search_graph.cc.

10.24.3.21 vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file search_graph.cc.

10.24.3.22 vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file search_graph.cc.

10.24.3.23 vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file search_graph.cc.

10.24.3.24 vmtl::dense_matrix<std::string>& coco::coco::basic_alltype::cdm ( ) [inline]

retrieve a dense_matrix<string> from the basic_alltype

Definition at line 1569 of file expression.h.

10.24.3.25 basic_alltype& coco::coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file search_graph.cc.

10.24.3.26 basic_alltype& coco::coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file search_graph.cc.

10.24.3.27 basic_alltype& coco::coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file expression.h.

10.24.3.28 basic_alltype& coco::coco::basic_alltype::clear ( ) [inline]

Reset the basic_alltype to an empty value

Definition at line 929 of file search_graph.cc.

10.24.3.29 int coco::coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file expression.h.

10.24.3.30 int coco::coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file search_graph.cc.

10.24.3.31 int coco::coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file search_graph.cc.

10.24.3.32 int coco::coco::basic_alltype::contents_type ( ) const [inline]

Return the type of the value contained in the storage, an int which can be compared with the ALLTYPE_... values.

Definition at line 1669 of file search_graph.cc.

10.24.3.33 const vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file search_graph.cc.

10.24.3.34 const vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file expression.h.

10.24.3.35 const vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file search_graph.cc.

10.24.3.36 const vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) const [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1314 of file search_graph.cc.

10.24.3.37 vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file search_graph.cc.

10.24.3.38 vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file expression.h.

10.24.3.39 vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file search_graph.cc.

10.24.3.40 vmtl::sparse_matrix<std::string>& coco::coco::basic_alltype::csm ( ) [inline]

retrieve a sparse_matrix<string> from the basic_alltype

Definition at line 1585 of file search_graph.cc.

10.24.3.41 const std::vector<double>& coco::coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file expression.h.

10.24.3.42 const std::vector<double>& coco::coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file search_graph.cc.

10.24.3.43 const std::vector<double>& coco::coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file search_graph.cc.

10.24.3.44 const std::vector<double>& coco::coco::basic_alltype::d ( ) const [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1133 of file search_graph.cc.

10.24.3.45 std::vector<double>& coco::coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file search_graph.cc.

10.24.3.46 std::vector<double>& coco::coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file expression.h.

10.24.3.47 std::vector<double>& coco::coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file search_graph.cc.

10.24.3.48 std::vector<double>& coco::coco::basic_alltype::d ( ) [inline]

retrieve a vector<double> from the basic_alltype

Definition at line 1405 of file search_graph.cc.

10.24.3.49 const vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file search_graph.cc.

10.24.3.50 const vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file expression.h.

10.24.3.51 const vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file search_graph.cc.

10.24.3.52 const vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) const [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1289 of file search_graph.cc.

10.24.3.53 vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file search_graph.cc.

10.24.3.54 vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file search_graph.cc.

10.24.3.55 vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file search_graph.cc.

10.24.3.56 vmtl::dense_matrix<double>& coco::coco::basic_alltype::dm ( ) [inline]

retrieve a dense_matrix<double> from the basic_alltype

Definition at line 1560 of file expression.h.

10.24.3.57 bool coco::coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file expression.h.

10.24.3.58 bool coco::coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file search_graph.cc.

10.24.3.59 bool coco::coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file search_graph.cc.

10.24.3.60 bool coco::coco::basic_alltype::empty ( ) const [inline]

Check, whether the basic_alltype is empty.

Definition at line 1666 of file search_graph.cc.

10.24.3.61 const std::vector<interval>& coco::coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file search_graph.cc.

10.24.3.62 const std::vector<interval>& coco::coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file expression.h.

10.24.3.63 const std::vector<interval>& coco::coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file search_graph.cc.

10.24.3.64 const std::vector<interval>& coco::coco::basic_alltype::i ( ) const [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1137 of file search_graph.cc.

10.24.3.65 std::vector<interval>& coco::coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file search_graph.cc.

10.24.3.66 std::vector<interval>& coco::coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file search_graph.cc.

10.24.3.67 std::vector<interval>& coco::coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file expression.h.

10.24.3.68 std::vector<interval>& coco::coco::basic_alltype::i ( ) [inline]

retrieve a vector<interval> from the basic_alltype

Definition at line 1409 of file search_graph.cc.

10.24.3.69 const vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file search_graph.cc.

10.24.3.70 const vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file expression.h.

10.24.3.71 const vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file search_graph.cc.

10.24.3.72 const vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) const [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1295 of file search_graph.cc.

10.24.3.73 vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file search_graph.cc.

10.24.3.74 vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file search_graph.cc.

10.24.3.75 vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file search_graph.cc.

10.24.3.76 vmtl::dense_matrix<interval>& coco::coco::basic_alltype::idm ( ) [inline]

retrieve a dense_matrix<interval> from the basic_alltype

Definition at line 1566 of file expression.h.

10.24.3.77 bool coco::coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file expression.h.

10.24.3.78 bool coco::coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file search_graph.cc.

10.24.3.79 bool coco::coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file search_graph.cc.

10.24.3.80 bool coco::coco::basic_alltype::is_allocated ( ) const [inline]

Check, whether the basic_alltype contains a complex type, i.e. one which has to be allocated (not bool, int, unsigned int, double, or interval).

Definition at line 1595 of file search_graph.cc.

10.24.3.81 bool coco::coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file expression.h.

10.24.3.82 bool coco::coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file search_graph.cc.

10.24.3.83 bool coco::coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file search_graph.cc.

10.24.3.84 bool coco::coco::basic_alltype::is_dense_matrix ( ) const [inline]

Check, whether the basic_alltype contains a dense matrix type.

Definition at line 1644 of file search_graph.cc.

10.24.3.85 bool coco::coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file expression.h.

10.24.3.86 bool coco::coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file search_graph.cc.

10.24.3.87 bool coco::coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file search_graph.cc.

10.24.3.88 bool coco::coco::basic_alltype::is_dense_vector ( ) const [inline]

Check, whether the basic_alltype contains a dense vector type.

Definition at line 1607 of file search_graph.cc.

10.24.3.89 bool coco::coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file expression.h.

10.24.3.90 bool coco::coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file search_graph.cc.

10.24.3.91 bool coco::coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file search_graph.cc.

10.24.3.92 bool coco::coco::basic_alltype::is_empty_matrix ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1648 of file search_graph.cc.

10.24.3.93 bool coco::coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file expression.h.

10.24.3.94 bool coco::coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file search_graph.cc.

10.24.3.95 bool coco::coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file search_graph.cc.

10.24.3.96 bool coco::coco::basic_alltype::is_empty_vector ( ) const [inline]

Check, whether the basic_alltype contains a size 0 vector type.

Definition at line 1613 of file search_graph.cc.

10.24.3.97 bool coco::coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file expression.h.

10.24.3.98 bool coco::coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file search_graph.cc.

10.24.3.99 bool coco::coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file search_graph.cc.

10.24.3.100 bool coco::coco::basic_alltype::is_matrix ( ) const [inline]

Check, whether the basic_alltype contains a matrix type.

Definition at line 1642 of file search_graph.cc.

10.24.3.101 bool coco::coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file expression.h.

10.24.3.102 bool coco::coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file search_graph.cc.

10.24.3.103 bool coco::coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file search_graph.cc.

10.24.3.104 bool coco::coco::basic_alltype::is_scalar ( ) const [inline]

Check, whether the basic_alltype contains a scalar type, i.e. neither a vector nor a matrix.

Definition at line 1598 of file search_graph.cc.

10.24.3.105 bool coco::coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file search_graph.cc.

10.24.3.106 bool coco::coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file search_graph.cc.

10.24.3.107 bool coco::coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file expression.h.

10.24.3.108 bool coco::coco::basic_alltype::is_sparse_matrix ( ) const [inline]

Check, whether the basic_alltype contains a sparse matrix type.

Definition at line 1646 of file search_graph.cc.

10.24.3.109 bool coco::coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file expression.h.

10.24.3.110 bool coco::coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file search_graph.cc.

10.24.3.111 bool coco::coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file search_graph.cc.

10.24.3.112 bool coco::coco::basic_alltype::is_sparse_vector ( ) const [inline]

Check, whether the basic_alltype contains a sparse vector type.

Definition at line 1610 of file search_graph.cc.

10.24.3.113 bool coco::coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file expression.h.

10.24.3.114 bool coco::coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file search_graph.cc.

10.24.3.115 bool coco::coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file search_graph.cc.

10.24.3.116 bool coco::coco::basic_alltype::is_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector type.

Definition at line 1601 of file search_graph.cc.

10.24.3.117 bool coco::coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file expression.h.

10.24.3.118 bool coco::coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file search_graph.cc.

10.24.3.119 bool coco::coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file search_graph.cc.

10.24.3.120 bool coco::coco::basic_alltype::is_vector_of_vector ( ) const [inline]

Check, whether the basic_alltype contains a vector of vector type.

Definition at line 1604 of file search_graph.cc.

10.24.3.121 const vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file search_graph.cc.

10.24.3.122 const vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file expression.h.

10.24.3.123 const vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file search_graph.cc.

10.24.3.124 const vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) const [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1311 of file search_graph.cc.

10.24.3.125 vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file expression.h.

10.24.3.126 vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file search_graph.cc.

10.24.3.127 vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file search_graph.cc.

10.24.3.128 vmtl::sparse_matrix<interval>& coco::coco::basic_alltype::ism ( ) [inline]

retrieve a sparse_matrix<interval> from the basic_alltype

Definition at line 1582 of file search_graph.cc.

10.24.3.129 bool coco::coco::basic_alltype::less_equal (const basic_alltype & *b*) const

Total order comparison operator

retrieve a bool from the basic_alltype

Definition at line 1321 of file search_graph.cc.

10.24.3.153 double coco::coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file search_graph.cc.

10.24.3.154 double coco::coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file search_graph.cc.

10.24.3.155 double coco::coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file expression.h.

10.24.3.156 double coco::coco::basic_alltype::nd ( ) const [inline]

retrieve a double from the basic_alltype

Definition at line 1070 of file search_graph.cc.

10.24.3.157 double& coco::coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file search_graph.cc.

10.24.3.158 double& coco::coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file expression.h.

10.24.3.159 double& coco::coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file search_graph.cc.

10.24.3.160 double& coco::coco::basic_alltype::nd ( ) [inline]

retrieve a double from the basic_alltype

Definition at line 1342 of file search_graph.cc.

10.24.3.161 const vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file search_graph.cc.

10.24.3.162 const vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file expression.h.

10.24.3.163 const vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file search_graph.cc.

10.24.3.164 const vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) const [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1292 of file search_graph.cc.

10.24.3.165 vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file search_graph.cc.

10.24.3.166 vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file search_graph.cc.

10.24.3.167 vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file search_graph.cc.

10.24.3.168 vmtl::dense_matrix<int>& coco::coco::basic_alltype::ndm ( ) [inline]

retrieve a dense_matrix<int> from the basic_alltype

Definition at line 1563 of file expression.h.

10.24.3.169 interval coco::coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file search_graph.cc.

10.24.3.170 interval coco::coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file search_graph.cc.

10.24.3.171 interval coco::coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file expression.h.

10.24.3.172 interval coco::coco::basic_alltype::ni ( ) const [inline]

retrieve an interval from the basic_alltype

Definition at line 1073 of file search_graph.cc.

10.24.3.173 interval_st& coco::coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file search_graph.cc.

10.24.3.174 interval_st& coco::coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file expression.h.

10.24.3.175 interval_st& coco::coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file search_graph.cc.

10.24.3.176 interval_st& coco::coco::basic_alltype::ni ( ) [inline]

retrieve an interval from the basic_alltype

Definition at line 1345 of file search_graph.cc.

10.24.3.177 int coco::coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file search_graph.cc.

10.24.3.178 int coco::coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file expression.h.

10.24.3.179 int coco::coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file search_graph.cc.

10.24.3.180 int coco::coco::basic_alltype::nn ( ) const [inline]

retrieve an int from the basic_alltype

Definition at line 1052 of file search_graph.cc.

10.24.3.181 int& coco::coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file search_graph.cc.

10.24.3.182 int& coco::coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file expression.h.

10.24.3.183 int& coco::coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file search_graph.cc.

10.24.3.184 int& coco::coco::basic_alltype::nn ( ) [inline]

retrieve an int from the basic_alltype

Definition at line 1324 of file search_graph.cc.

10.24.3.185 const vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file search_graph.cc.

10.24.3.186 const vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file expression.h.

10.24.3.187 const vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file search_graph.cc.

10.24.3.188 const vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) const [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1308 of file search_graph.cc.

10.24.3.189 vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file search_graph.cc.

10.24.3.190 vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file search_graph.cc.

10.24.3.191 vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file search_graph.cc.

10.24.3.192 vmtl::sparse_matrix<int>& coco::coco::basic_alltype::nsm ( ) [inline]

retrieve a sparse_matrix<int> from the basic_alltype

Definition at line 1579 of file expression.h.

10.24.3.193 unsigned int coco::coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file search_graph.cc.

10.24.3.194 unsigned int coco::coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file search_graph.cc.

10.24.3.195 unsigned int coco::coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file search_graph.cc.

10.24.3.196 unsigned int coco::coco::basic_alltype::nu ( ) const [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1061 of file expression.h.

10.24.3.197 unsigned int& coco::coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file search_graph.cc.

10.24.3.198 unsigned int& coco::coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file expression.h.

10.24.3.199 unsigned int& coco::coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file search_graph.cc.

10.24.3.200 unsigned int& coco::coco::basic_alltype::nu ( ) [inline]

retrieve an unsigned int from the basic_alltype

Definition at line 1333 of file search_graph.cc.

10.24.3.201 bool coco::coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

10.24.3.202 bool coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

Definition at line 318 of file basic_alltype.cc.

10.24.3.203 bool coco::coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

10.24.3.204 bool coco::coco::basic_alltype::operator!= (const basic_alltype & *b*) const

Standard comparison operator

10.24.3.205 basic_alltype& coco::coco::basic_alltype::operator= (bool __x) [inline]

Assignment Operator, assigning the bool value __x

Definition at line 647 of file expression.h.

10.24.3.206 basic_alltype& coco::coco::basic_alltype::operator= (bool __x) [inline]

Assignment Operator, assigning the bool value __x

Definition at line 647 of file search_graph.cc.

10.24.3.207 basic_alltype& coco::coco::basic_alltype::operator= (bool __x) [inline]

Assignment Operator, assigning the bool value __x

Definition at line 647 of file search_graph.cc.

10.24.3.208 basic_alltype& coco::coco::basic_alltype::operator= (bool __x) [inline]

Assignment Operator, assigning the bool value __x

Definition at line 647 of file search_graph.cc.

10.24.3.209 basic_alltype& coco::coco::basic_alltype::operator= (int __x) [inline]

Assignment Operator, assigning the int value __x

Definition at line 653 of file search_graph.cc.

10.24.3.210 basic_alltype& coco::coco::basic_alltype::operator= (int __x) [inline]

Assignment Operator, assigning the int value __x

Definition at line 653 of file search_graph.cc.

10.24.3.211 basic_alltype& coco::coco::basic_alltype::operator= (int __x) [inline]

Assignment Operator, assigning the int value __x

Definition at line 653 of file expression.h.

10.24.3.212 basic_alltype& coco::coco::basic_alltype::operator= (int __x) [inline]

Assignment Operator, assigning the int value __x

Definition at line 653 of file search_graph.cc.

10.24.3.213 basic_alltype& coco::coco::basic_alltype::operator= (unsigned int __x) [inline]

Assignment Operator, assigning the unsigned int value __x

Definition at line 659 of file search_graph.cc.

10.24.3.214 basic_alltype& coco::coco::basic_alltype::operator= (unsigned int __x) [inline]

Assignment Operator, assigning the unsigned int value __x

Definition at line 659 of file search_graph.cc.

10.24.3.215 basic_alltype& coco::coco::basic_alltype::operator= (unsigned int __x) [inline]

Assignment Operator, assigning the unsigned int value __x

Definition at line 659 of file expression.h.

10.24.3.216 basic_alltype& coco::coco::basic_alltype::operator= (unsigned int __x) [inline]

Assignment Operator, assigning the unsigned int value __x

Definition at line 659 of file search_graph.cc.

10.24.3.217 basic_alltype& coco::coco::basic_alltype::operator= (double __x) [inline]

Assignment Operator, assigning the double value __x

Definition at line 665 of file expression.h.

10.24.3.218 basic_alltype& coco::coco::basic_alltype::operator= (double __x) [inline]

Assignment Operator, assigning the double value __x

Definition at line 665 of file search_graph.cc.

10.24.3.219 basic_alltype& coco::coco::basic_alltype::operator= (double __x) [inline]

Assignment Operator, assigning the double value __x

Definition at line 665 of file search_graph.cc.

10.24.3.220 basic_alltype& coco::coco::basic_alltype::operator= (double __x) [inline]

Assignment Operator, assigning the double value __x

Definition at line 665 of file search_graph.cc.

10.24.3.221 basic_alltype& coco::coco::basic_alltype::operator= (interval __x) [inline]

Assignment Operator, assigning the interval value __x

Definition at line 671 of file search_graph.cc.

10.24.3.222 basic_alltype& coco::coco::basic_alltype::operator= (interval __x) [inline]

Assignment Operator, assigning the interval value __x

Definition at line 671 of file search_graph.cc.

10.24.3.223 basic_alltype& coco::coco::basic_alltype::operator= (interval __x) [inline]

Assignment Operator, assigning the interval value ___x

Definition at line 671 of file expression.h.

10.24.3.224 basic_alltype& coco::coco::basic_alltype::operator= (interval __x) [inline]

Assignment Operator, assigning the interval value ___x

Definition at line 671 of file search_graph.cc.

10.24.3.225 basic_alltype& coco::coco::basic_alltype::operator= (void * __x) [inline]

Assignment Operator, assigning the void* value ___x

Definition at line 677 of file search_graph.cc.

10.24.3.226 basic_alltype& coco::coco::basic_alltype::operator= (void * __x) [inline]

Assignment Operator, assigning the void* value ___x

Definition at line 677 of file search_graph.cc.

10.24.3.227 basic_alltype& coco::coco::basic_alltype::operator= (void * __x) [inline]

Assignment Operator, assigning the void* value ___x

Definition at line 677 of file expression.h.

10.24.3.228 basic_alltype& coco::coco::basic_alltype::operator= (void * __x) [inline]

Assignment Operator, assigning the void* value ___x

Definition at line 677 of file search_graph.cc.

10.24.3.229 basic_alltype& coco::coco::basic_alltype::operator= (const std::string & __x) [inline]

Assignment Operator, assigning the string value ___x

Definition at line 683 of file search_graph.cc.

10.24.3.230 basic_alltype& coco::coco::basic_alltype::operator= (const std::string & __x) [inline]

Assignment Operator, assigning the string value ___x

Definition at line 683 of file search_graph.cc.

10.24.3.231 basic_alltype& coco::coco::basic_alltype::operator= (const std::string & __x) [inline]

Assignment Operator, assigning the string value ___x

Definition at line 683 of file search_graph.cc.

10.24.3.232 basic_alltype& coco::coco::basic_alltype::operator= (const std::string & __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 683 of file expression.h.

10.24.3.233 basic_alltype& coco::coco::basic_alltype::operator= (const char * __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 690 of file expression.h.

10.24.3.234 basic_alltype& coco::coco::basic_alltype::operator= (const char * __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 690 of file search_graph.cc.

10.24.3.235 basic_alltype& coco::coco::basic_alltype::operator= (const char * __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 690 of file search_graph.cc.

10.24.3.236 basic_alltype& coco::coco::basic_alltype::operator= (const char * __x) [inline]

Assignment Operator, assigning the string value __x

Definition at line 690 of file search_graph.cc.

10.24.3.237 basic_alltype& coco::coco::basic_alltype::operator= (const num::Number & __x) [inline]

Assignment Operator, assigning the Number value __x

Definition at line 697 of file search_graph.cc.

10.24.3.238 basic_alltype& coco::coco::basic_alltype::operator= (const num::Number & __x) [inline]

Assignment Operator, assigning the Number value __x

Definition at line 697 of file search_graph.cc.

10.24.3.239 basic_alltype& coco::coco::basic_alltype::operator= (const num::Number & __x) [inline]

Assignment Operator, assigning the Number value __x

Definition at line 697 of file expression.h.

10.24.3.240 basic_alltype& coco::coco::basic_alltype::operator= (const num::Number & __x) [inline]

Assignment Operator, assigning the Number value __x

Definition at line 697 of file search_graph.cc.

10.24.3.241 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value __x

Definition at line 704 of file search_graph.cc.

10.24.3.242 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value __x

Definition at line 704 of file search_graph.cc.

10.24.3.243 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value __x

Definition at line 704 of file expression.h.

10.24.3.244 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< bool > & __x) [inline]

Assignment Operator, assigning the vector<bool> value __x

Definition at line 704 of file search_graph.cc.

10.24.3.245 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value __x

Definition at line 711 of file search_graph.cc.

10.24.3.246 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value __x

Definition at line 711 of file search_graph.cc.

10.24.3.247 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value __x

Definition at line 711 of file expression.h.

10.24.3.248 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< int > & __x) [inline]

Assignment Operator, assigning the vector<int> value __x

Definition at line 711 of file search_graph.cc.

10.24.3.249 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value __x

Definition at line 718 of file search_graph.cc.

10.24.3.250 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value __x

Definition at line 718 of file search_graph.cc.

10.24.3.251 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value __x

Definition at line 718 of file expression.h.

10.24.3.252 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the vector<unsigned int> value __x

Definition at line 718 of file search_graph.cc.

Assignment Operator, assigning the vector<vector<bool> > value __x

Definition at line 753 of file search_graph.cc.

10.24.3.273 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value __x

Definition at line 760 of file expression.h.

10.24.3.274 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value __x

Definition at line 760 of file search_graph.cc.

10.24.3.275 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value __x

Definition at line 760 of file search_graph.cc.

10.24.3.276 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<int> > value __x

Definition at line 760 of file search_graph.cc.

10.24.3.277 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value __x

Definition at line 767 of file expression.h.

10.24.3.278 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value __x

Definition at line 767 of file search_graph.cc.

10.24.3.279 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value __x

Definition at line 767 of file search_graph.cc.

10.24.3.280 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< unsigned int > > & __x) [inline]

Assignment Operator, assigning the vector<vector<unsigned int> > value __x

Definition at line 767 of file search_graph.cc.

10.24.3.281 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value __x

Definition at line 774 of file search_graph.cc.

10.24.3.282 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value __x

Definition at line 774 of file search_graph.cc.

10.24.3.283 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value __x

Definition at line 774 of file expression.h.

10.24.3.284 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< double > > & __x) [inline]

Assignment Operator, assigning the vector<vector<double> > value __x

Definition at line 774 of file search_graph.cc.

10.24.3.285 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value __x

Definition at line 781 of file search_graph.cc.

10.24.3.286 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value __x

Definition at line 781 of file expression.h.

10.24.3.287 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value __x

Definition at line 781 of file search_graph.cc.

10.24.3.288 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< interval > > & __x) [inline]

Assignment Operator, assigning the vector<vector<interval> > value __x

Definition at line 781 of file search_graph.cc.

10.24.3.289 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value __x

Definition at line 788 of file search_graph.cc.

10.24.3.290 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value __x

Definition at line 788 of file search_graph.cc.

10.24.3.291 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value __x

Definition at line 788 of file expression.h.

10.24.3.292 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< std::string > > & __x) [inline]

Assignment Operator, assigning the vector<vector<string> > value __x

Definition at line 788 of file search_graph.cc.

10.24.3.293 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value __x

Definition at line 795 of file search_graph.cc.

10.24.3.294 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value __x

Definition at line 795 of file search_graph.cc.

10.24.3.295 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value __x

Definition at line 795 of file expression.h.

10.24.3.296 basic_alltype& coco::coco::basic_alltype::operator= (const std::vector< std::vector< num::Number > > & __x) [inline]

Assignment Operator, assigning the vector<vector<Number> > value __x

Definition at line 795 of file search_graph.cc.

10.24.3.297 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value __x

Definition at line 802 of file search_graph.cc.

10.24.3.298 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value __x

Definition at line 802 of file search_graph.cc.

10.24.3.299 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value __x

Definition at line 802 of file expression.h.

10.24.3.300 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< bool > & __x) [inline]

Assignment Operator, assigning the sparse_vector<bool> value __x

Definition at line 802 of file search_graph.cc.

10.24.3.301 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value __x

Definition at line 809 of file search_graph.cc.

10.24.3.302 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value __x

Definition at line 809 of file search_graph.cc.

10.24.3.303 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value __x

Definition at line 809 of file expression.h.

10.24.3.304 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<int> value __x

Definition at line 809 of file search_graph.cc.

10.24.3.305 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file search_graph.cc.

10.24.3.306 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file search_graph.cc.

10.24.3.307 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file expression.h.

10.24.3.308 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< unsigned int > & __x) [inline]

Assignment Operator, assigning the sparse_vector<unsigned int> value __x

Definition at line 816 of file search_graph.cc.

10.24.3.309 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file search_graph.cc.

10.24.3.310 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file search_graph.cc.

10.24.3.311 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file expression.h.

10.24.3.312 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< double > & __x) [inline]

Assignment Operator, assigning the sparse_vector<double> value __x

Definition at line 823 of file search_graph.cc.

10.24.3.313 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file search_graph.cc.

10.24.3.314 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file search_graph.cc.

10.24.3.315 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file expression.h.

10.24.3.316 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< interval > & __x) [inline]

Assignment Operator, assigning the sparse_vector<interval> value __x

Definition at line 830 of file search_graph.cc.

10.24.3.317 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file search_graph.cc.

10.24.3.318 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file search_graph.cc.

10.24.3.319 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file expression.h.

10.24.3.320 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< std::string > & __x) [inline]

Assignment Operator, assigning the sparse_vector<string> value __x

Definition at line 837 of file search_graph.cc.

10.24.3.321 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file search_graph.cc.

10.24.3.322 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file search_graph.cc.

10.24.3.323 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file search_graph.cc.

10.24.3.324 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::sparse_vector< num::Number > & __x) [inline]

Assignment Operator, assigning the sparse_vector<Number> value __x

Definition at line 844 of file expression.h.

10.24.3.325 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file search_graph.cc.

10.24.3.326 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file search_graph.cc.

10.24.3.327 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file search_graph.cc.

10.24.3.328 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< double > & __x) [inline]

Assignment Operator, assigning the dense_matrix<double> value __x

Definition at line 851 of file expression.h.

10.24.3.329 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file expression.h.

10.24.3.330 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file search_graph.cc.

10.24.3.331 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file search_graph.cc.

10.24.3.332 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< int > & __x) [inline]

Assignment Operator, assigning the dense_matrix<int> value __x

Definition at line 858 of file search_graph.cc.

10.24.3.333 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file expression.h.

10.24.3.334 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file search_graph.cc.

10.24.3.335 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file search_graph.cc.

10.24.3.336 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< interval > & __x) [inline]

Assignment Operator, assigning the dense_matrix<interval> value __x

Definition at line 865 of file search_graph.cc.

10.24.3.337 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file expression.h.

10.24.3.338 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file search_graph.cc.

10.24.3.339 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file search_graph.cc.

10.24.3.340 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< std::string > & __x) [inline]

Assignment Operator, assigning the dense_matrix<string> value __x

Definition at line 872 of file search_graph.cc.

10.24.3.341 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file expression.h.

10.24.3.342 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file search_graph.cc.

10.24.3.343 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file search_graph.cc.

10.24.3.344 basic_alltype& coco::coco::basic_alltype::operator= (const vmtl::dense_matrix< num::Number > & __x) [inline]

Assignment Operator, assigning the dense_matrix<Number> value __x

Definition at line 879 of file search_graph.cc.

10.25.1 Detailed Description

The bbfunc class is the base class for black box functions. It is an abstract class for various types of black box functions.

10.25.2 Constructor & Destructor Documentation

10.25.2.1 coco::bbfunc::bbfunc ( ) [inline]

Default Constructor

Definition at line 57 of file bbfunc.h.

10.25.2.2 virtual coco::bbfunc::~bbfunc ( ) [inline, virtual]

Standard Destructor

Definition at line 60 of file bbfunc.h.

10.25.3 Member Function Documentation

10.25.3.1 virtual uint64_t coco::bbfunc::chash ( ) [pure virtual]

the const hash value for hash calculation in the DAG

10.25.3.2 virtual convex_info coco::bbfunc::convexity (const std::vector< interval > & *x*) const [pure virtual]

return convexity information on `i`.

10.25.3.3 virtual std::string coco::bbfunc::dag_out ( ) const [inline, virtual]

the parameters written in DAG format (it must contain necessary ':'s)

Definition at line 73 of file bbfunc.h.

10.25.3.4 virtual int coco::bbfunc::differentiability (const std::vector< interval > & *x*) const [pure virtual]

return differentiability information on `i`.

10.25.3.5 virtual bbfunc* coco::bbfunc::differentiate ( ) const [pure virtual]

differentiate symbolically

10.25.3.6 virtual double coco::bbfunc::eval (const std::vector< double > & *x*) const [pure virtual]

the point evaluation

10.25.3.7 virtual interval coco::bbfunc::eval (const std::vector< interval > & *x*) const [pure virtual]

the range evaluation

10.25.3.8 virtual interval coco::bbfunc::eval_slp (const std::vector< interval > & *z*, const std::vector< interval > & *x*, unsigned int *i*) const [pure virtual]

the interval first order slope evaluation at center z

10.25.3.9 virtual interval coco::bbfunc::eval_slp2 (const std::vector< interval > & *z*, const std::vector< interval > & *y*, const std::vector< interval > & *x*, unsigned int *i*, unsigned int *j*) const [pure virtual]

the interval second order slope evaluation at centers z and y

10.25.3.10 virtual interval coco::bbfunc::eval_slp2 (const std::vector< interval > & *z*, const std::vector< interval > & *x*, unsigned int *i*, unsigned int *j*) const [pure virtual]

the interval second order slope evaluation at double center z

10.25.3.11 virtual std::pair<double,double> coco::bbfunc::evald (const std::vector< double > & *x*, unsigned int *i*) const [pure virtual]

the point and derivative evaluation

10.25.3.12 virtual std::pair<interval,interval> coco::bbfunc::evald (const std::vector< interval > & *x*, unsigned int *i*) const [pure virtual]

the point and derivative evaluation

10.25.3.13 virtual void coco::bbfunc::evalf (const std::vector< double > & *x*, double * *r*, unsigned int *i*, unsigned int *j*, unsigned int *k*) const [pure virtual]

the point, first to third derivative evaluation

10.25.3.14 virtual void coco::bbfunc::evalf (const std::vector< interval > & *x*, interval * *r*, unsigned int *i*, unsigned int *j*, unsigned int *k*) const [pure virtual]

the point, first to third derivative evaluation

10.25.3.15 virtual std::triple<double,double,double> coco::bbfunc::evalt (const std::vector< double > & *x*, unsigned int *i*, unsigned int *j*) const [pure virtual]

the point and first and second derivative evaluation

10.25.3.16 virtual std::triple<interval,interval,interval> coco::bbfunc::evalt (const std::vector< interval > & *x*, unsigned int *i*, unsigned int *j*) const [pure virtual]

the point and first and second derivative evaluation

10.25.3.17 virtual const char* coco::bbfunc::func_name ( ) const [pure virtual]

the name of the bbfunc.

10.25.3.18 virtual interval_set coco::bbfunc::intersect_inv (const std::vector< interval > & *x*, const interval & *r*, unsigned int *i*) const [pure virtual]

back propagation

10.25.3.19 virtual interval_set coco::bbfunc::intersect_inv (const std::vector< interval_set > & *x*, const interval_set & *r*, unsigned int *i*) const [virtual]

back propagation

10.25.3.20 virtual bool coco::bbfunc::operator!= (const bbfunc & *b*) const [inline, virtual]

the other comparison operator

Definition at line 134 of file bbfunc.h.

10.25.3.21 virtual bool coco::bbfunc::operator== (const bbfunc & *b*) const [inline, virtual]

the comparison operator

Definition at line 131 of file bbfunc.h.

10.25.3.22 virtual std::string coco::bbfunc::print_params ( ) const [inline, virtual]

the parameters written in printable form

Definition at line 76 of file bbfunc.h.

10.25.3.23 virtual unsigned int coco::bbfunc::supported_eval_order ( ) const [pure virtual]

return the maximal evaluation order supported.

10.25.3.24 virtual uint64_t coco::bbfunc::thash ( ) [pure virtual]

the pure hash value for hash calculation in the DAG

The documentation for this class was generated from the following file:

- bbfunc.h

10.26.1 Detailed Description

The bbfunc_expr class is the class for black box function expressions. It wraps the bbfunc class with an additional parameter for the order of the derivative.

10.26.2 Constructor & Destructor Documentation

10.26.2.1 coco::bbfunc_expr::bbfunc_expr (bbfunc * _d) [inline]

constructor: note the _d should be allocated with new!

Definition at line 66 of file bbfunc_expr.h.

10.26.2.2 coco::bbfunc_expr::~bbfunc_expr ( ) [inline]

the destructor

Definition at line 69 of file bbfunc_expr.h.

10.26.3 Member Function Documentation

10.26.3.1 convex_e coco::bbfunc_expr::convex_update (const std::vector< convex_e > & *c*, const std::vector< interval > & *x*) const

update the convexity information for in argument convexity c on box x.

Definition at line 36 of file bbfunc_expr.cc.

10.26.3.2 std::string coco::bbfunc_expr::dag_out ( ) const [inline]

the parameters written in DAG format (it must contain necessary ':'s)

Definition at line 59 of file bbfunc_expr.h.

10.26.3.3 int coco::bbfunc_expr::differentiability (const std::vector< int > & *v_diff*, const std::vector< interval > & *x*) const

return differentiability information on box x.

Definition at line 93 of file bbfunc_expr.cc.

10.26.3.4 bbfunc_expr* coco::bbfunc_expr::differentiate (unsigned int *order*) const [inline]

differentiate a bbfunc_expr

Definition at line 137 of file bbfunc_expr.h.

10.26.3.5 double coco::bbfunc_expr::eval (std::vector< double > & *x*) const [inline]

the point evaluation

Definition at line 73 of file bbfunc_expr.h.

10.26.3.6 interval coco::bbfunc_expr::eval (const std::vector< interval > & *x*) const [inline]

the range evaluation

Definition at line 87 of file bbfunc_expr.h.

10.26.3.7 interval_set coco::bbfunc_expr::eval (const std::vector< interval_set > & *x*) const

the range evaluation

Definition at line 120 of file bbfunc_expr.cc.

10.26.3.8 interval coco::bbfunc_expr::eval_slp (const std::vector< interval > & *z*, const std::vector< interval > & *x*, unsigned int *i*) const [inline]

the interval first order slope evaluation at center z

Definition at line 104 of file bbfunc_expr.h.

10.26.3.9 interval coco::bbfunc_expr::eval_slp2 (const std::vector< interval > & z, const std::vector< interval > & y, const std::vector< interval > & x, unsigned int i, unsigned int j) const [inline]

the interval second order slope evaluation at centers z and y

Definition at line 108 of file bbfunc_expr.h.

10.26.3.10 interval coco::bbfunc_expr::eval_slp2 (const std::vector< interval > & z, const std::vector< interval > & x, unsigned int i, unsigned int j) const [inline]

the interval second order slope evaluation at double center z

Definition at line 113 of file bbfunc_expr.h.

10.26.3.11 std::pair<double,double> coco::bbfunc_expr::evald (std::vector< double > & x, unsigned int i) const [inline]

the point and first derivative evaluation

Definition at line 76 of file bbfunc_expr.h.

10.26.3.12 std::pair<interval,interval> coco::bbfunc_expr::evald (std::vector< interval > & x, unsigned int i) const [inline]

the point and first derivative evaluation

Definition at line 90 of file bbfunc_expr.h.

10.26.3.13 void coco::bbfunc_expr::evalf (std::vector< double > & x, double * r, unsigned int i, unsigned int j, unsigned int k) const [inline]

the point, and first to third derivative evaluation

Definition at line 83 of file bbfunc_expr.h.

10.26.3.14 void coco::bbfunc_expr::evalf (std::vector< interval > & x, interval * r, unsigned int i, unsigned int j, unsigned int k) const [inline]

the point, and first to third derivative evaluation

Definition at line 98 of file bbfunc_expr.h.

10.26.3.15 std::triple<double,double,double> coco::bbfunc_expr::evalt (std::vector< double > & x, unsigned int i, unsigned int j) const [inline]

the point, first and second derivative evaluation

Definition at line 79 of file bbfunc_expr.h.

10.26.3.16 std::triple<interval,interval,interval> coco::bbfunc_expr::evalt (std::vector< interval > & x, unsigned int i, unsigned int j) const [inline]

the point, first and second derivative evaluation

Definition at line 94 of file bbfunc_expr.h.

10.26.3.17 std::string coco::bbfunc_expr::func_name ( ) const [inline]

the name of the bbfunc.

Definition at line 56 of file bbfunc_expr.h.

10.26.3.18 interval_set coco::bbfunc_expr::intersect_inv (const std::vector< interval > & *x*, const interval & *r*, unsigned int *i*) const [inline]

Definition at line 116 of file bbfunc_expr.h.

10.26.3.19 interval_set coco::bbfunc_expr::intersect_inv (const std::vector< interval_set > & *x*, const interval_set & *r*, unsigned int *i*) const [inline]

back propagation

Definition at line 120 of file bbfunc_expr.h.

10.26.3.20 bool coco::bbfunc_expr::operator!= (const bbfunc_expr & *b*) const [inline]

the other comparison operator

Definition at line 133 of file bbfunc_expr.h.

10.26.3.21 bool coco::bbfunc_expr::operator== (const bbfunc_expr & *b*) const [inline]

the comparison operator

Definition at line 129 of file bbfunc_expr.h.

10.26.3.22 std::string coco::bbfunc_expr::print_params ( ) const [inline]

the parameters written in printable form

Definition at line 62 of file bbfunc_expr.h.

10.26.3.23 unsigned int coco::bbfunc_expr::supported_eval_order ( ) const [inline]

the maximal order of derivatives which can be evaluated.

Definition at line 125 of file bbfunc_expr.h.

The documentation for this class was generated from the following files:

- bbfunc_expr.h
- bbfunc_expr.cc

10.27.1 Detailed Description

This class is used to specify information for changing the node bounds within a model.

10.27.2 Constructor & Destructor Documentation

10.27.2.1 coco::bound_delta::bound_delta (const std::vector< unsigned int > & __i, const std::vector< interval > & __b) [inline]

Constructor which explicitly assigns the indices ___i and the new bounds ___b.

Definition at line 109 of file bound_delta.h.

10.27.2.2 coco::bound_delta::bound_delta (unsigned int __i, interval __b) [inline]

Constructor which explicitly assigns one index ___i and the corresponding bound ___b.

Definition at line 116 of file bound_delta.h.

10.27.2.3 coco::bound_delta::bound_delta (const bound_delta & __d) [inline]

Standard Copy Constructor

Definition at line 121 of file bound_delta.h.

10.27.3 Member Function Documentation

10.27.3.1 bool coco::bound_delta::apply (work_node & _x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const

Apply the delta with delta_id _d to work node _x, hereby changing the bounds as requested.

Definition at line 34 of file bound_delta.cc.

10.27.3.2 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.27.3.3 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.27.3.4 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.27.3.5 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.27.3.6 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.27.3.7 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.27.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.27.3.9 void coco::bound_delta::destroy_copy (delta_base * __d) const [inline]

Clone Destructor

Definition at line 132 of file bound_delta.h.

10.27.3.10 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.27.3.11 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.27.3.12 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.27.3.13 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.27.3.14 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.27.3.15 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.27.3.16 bound_delta* coco::bound_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Definition at line 130 of file bound_delta.h.

10.27.3.17 bool coco::bound_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 143 of file bound_delta.h.

10.27.3.18 bool coco::bound_delta::operator!= (const bound_delta & *_c*) const [inline]

Definition at line 151 of file bound_delta.h.

10.27.3.19 bool coco::bound_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Definition at line 140 of file bound_delta.h.

10.27.3.20 bool coco::bound_delta::operator== (const bound_delta & *_c*) const [inline]

Comparison operators

Definition at line 148 of file bound_delta.h.

10.27.3.21 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.27.3.22 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.27.3.23 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.27.4 Member Data Documentation

10.27.4.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

10.27.4.2 std::vector<unsigned int> coco::bound_delta::indices

This variable holds the indices of the changed nodes. If **all** variables are being updated this vector is empty.

Definition at line 103 of file bound_delta.h.

10.27.4.3 std::vector<interval> coco::bound_delta::new_f_bounds

This variable holds the new bounds of the changed nodes.

Definition at line 105 of file bound_delta.h.

The documentation for this class was generated from the following files:

- bound_delta.h
- bound_delta.cc

10.28 coco::bound_undelta Class Reference

The bound undelta class for undoing changes to the node bounds in a model.

Friends

- class bound_delta

10.28.1 Detailed Description

This class is used to specify undo information for changes to the node bounds within a model. This class undoes the apply of a bound_delta.

10.28.2 Constructor & Destructor Documentation

10.28.2.1 coco::bound_undelta::bound_undelta (const std::vector< unsigned int > & __i, const std::vector< interval > & __b, double _og, double _olv) [inline]

Constructor, setting `indices` to `__i`, the `old_f_bounds` to `__b`, the `old_gain` to `_og`, and the `old_log_vol` to `_olv`.

Definition at line 56 of file bound_delta.h.

10.28.2.2 coco::bound_undelta::bound_undelta (const std::vector< unsigned int > & __i, double _og, double _olv) [inline]

Constructor, setting `indices` to `__i`, the `old_gain` to `_og`, the `old_log_vol` to `_olv`, and leaving `old_f_bounds` empty.

Definition at line 64 of file bound_delta.h.

10.28.2.3 coco::bound_undelta::bound_undelta (const bound_undelta & __d) [inline]

Standard Copy Constructor

Definition at line 70 of file bound_delta.h.

10.28.3 Member Function Documentation

10.28.3.1 void coco::bound_undelta::destroy_copy (undelta_base * __d) const [inline]

Clone Destructor

Definition at line 84 of file bound_delta.h.

10.28.3.2 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.28.3.3 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.28.3.4 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.28.3.5 bound_undelta* coco::bound_undelta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::undelta_base.

Definition at line 82 of file bound_delta.h.

10.28.3.6 bool coco::bound_undelta::unapply (work_node & _x, const delta_id & _did) const [virtual]

Undo the bound_delta with delta_id _i in work node _x

Reimplemented from coco::coco::undelta_base.

Definition at line 78 of file bound_delta.cc.

10.28.3.7 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.28.3.8 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.28.3.9 bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [inline, virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

Definition at line 94 of file api_delta.h.

10.28.4 Friends And Related Function Documentation

10.28.4.1 friend class bound_delta [friend]

Definition at line 89 of file bound_delta.h.

10.28.5 Member Data Documentation

10.28.5.1 std::vector<unsigned int> coco::bound_undelta::indices

This variable holds the indices of the changed nodes. If **all** variables are being updated this vector is empty.

Definition at line 46 of file bound_delta.h.

10.28.5.2 std::vector<interval> coco::bound_undelta::old_f_bounds

This variable holds the old bounds of the changed nodes.

Definition at line 49 of file bound_delta.h.

10.28.5.3 double coco::bound_undelta::old_gain

the gain in the work_node before the application

Definition at line 51 of file bound_delta.h.

10.28.5.4 double coco::bound_undelta::old_log_vol

the old log-Volume of the work_node

Definition at line 52 of file bound_delta.h.

The documentation for this class was generated from the following files:

- bound_delta.h
- bound_delta.cc

10.29 coco::box_check_intersection Class Reference

Stored procedure checking whether a box intersects the work_node's box.

`#include <dbtools.h>`

Public Types

- typedef work_node_context context
- typedef bool return_type

Public Member Functions

- box_check_intersection (vdbl::colid _x)
- box_check_intersection (const box_check_intersection &_i)
- virtual ~box_check_intersection ()
- bool operator() () const
- bool def () const
- void setcontext (const context *c, const vdbl::row *r)

10.29.1 Detailed Description

This class is used as a stored procedure (vdbl::method) for checking whether a box stored in the "boxes" table is disjunct with the search box in the evaluation context of a given work_node.

10.29.2 Member Typedef Documentation

10.29.2.1 typedef work_node_context coco::box_check_intersection::context

The evaluation context type

Definition at line 99 of file dbtools.h.

10.29.2.2 typedef bool coco::box_check_intersection::return_type

The return type of the operator(), i.e. the function class.

Definition at line 113 of file dbtools.h.

10.29.3 Constructor & Destructor Documentation

10.29.3.1 coco::box_check_intersection::box_check_intersection (vdbl::colid _x) [inline]

Constructor setting the relevant column id.

Definition at line 116 of file dbtools.h.

10.29.3.2 coco::box_check_intersection::box_check_intersection (const box_check_intersection & _i) [inline]

Standard Copy Constructor

Definition at line 119 of file dbtools.h.

10.29.3.3 virtual coco::box_check_intersection::~box_check_intersection ( ) [inline, virtual]

Standard Destructor

Definition at line 122 of file dbtools.h.

10.29.4 Member Function Documentation

10.29.4.1 bool coco::box_check_intersection::def ( ) const [inline]

Method, which computes the default value of the stored procedure

Definition at line 127 of file dbtools.h.

10.29.4.2 bool coco::box_check_intersection::operator() ( ) const

Evaluation operator, which computes the value of the stored procedure

10.29.4.3 void coco::box_check_intersection::setcontext (const context * c, const vdbl::row * r) [inline]

This method initializes the evaluation context and the row, preparing for the evaluation.

Definition at line 130 of file dbtools.h.

The documentation for this class was generated from the following file:

- dbtools.h

10.30 coco::coco::box_check_intersection Class Reference

Stored procedure checking whether a box intersects the work_node's box.

Public Types

- typedef work_node_context context
- typedef bool return_type

Public Member Functions

- box_check_intersection (vdbl::colid _x)
- box_check_intersection (const box_check_intersection &_i)
- virtual ~box_check_intersection ()
- bool operator() () const
- bool def () const
- void setcontext (const context *c, const vdbl::row *r)

10.30.1 Detailed Description

This class is used as a stored procedure (vdbl::method) for checking whether a box stored in the "boxes" table is disjunct with the search box in the evaluation context of a given work_node.

10.30.2 Member Typedef Documentation

10.30.2.1 typedef work_node_context coco::coco::box_check_intersection::context

The evaluation context type

Definition at line 99 of file search_graph.cc.

10.30.2.2 typedef bool coco::coco::box_check_intersection::return_type

The return type of the operator(), i.e. the function class.

Definition at line 113 of file search_graph.cc.

10.30.3 Constructor & Destructor Documentation

10.30.3.1 coco::coco::box_check_intersection::box_check_intersection (vdbl::colid _x) [inline]

Constructor setting the relevant column id.

Definition at line 116 of file search_graph.cc.

10.30.3.2 coco::coco::box_check_intersection::box_check_intersection (const box_check_intersection & _i) [inline]

Standard Copy Constructor

Definition at line 119 of file search_graph.cc.

10.30.3.3 virtual coco::coco::box_check_intersection::~box_check_intersection ( ) [inline, virtual]

Standard Destructor

Definition at line 122 of file search_graph.cc.

10.30.4 Member Function Documentation

10.30.4.1 bool coco::coco::box_check_intersection::def ( ) const [inline]

Method, which computes the default value of the stored procedure

Definition at line 127 of file search_graph.cc.

10.30.4.2 bool coco::box_check_intersection::operator() ( ) const

Evaluation operator, which computes the value of the stored procedure

Definition at line 76 of file dbtools.cc.

10.30.4.3 void coco::coco::box_check_intersection::setcontext (const context * c, const vdbl::row * r) [inline]

This method initializes the evaluation context and the row, preparing for the evaluation.

Definition at line 130 of file search_graph.cc.

The documentation for this class was generated from the following files:

10.31.1 Detailed Description

A specialized delta class which adds new boxes, e.g. exclusion boxes, to the search database. It is a subclass of table_delta and is, after storing the information in the search database, converted to an annotation_delta. Therefore, no `boxes_undelta` class is needed.

10.31.2 Member Typedef Documentation

10.31.2.1 typedef std::vector<t_line> coco::table_delta::t_ctr [inherited]

A variable of this type holds the new table entries.

Definition at line 49 of file table_delta.h.

10.31.2.2 typedef std::pair<std::string,dbt_row> coco::table_delta::t_line [inherited]

This type specifies one row in one table.

Definition at line 47 of file table_delta.h.

10.31.3 Constructor & Destructor Documentation

10.31.3.1 coco::boxes_delta::boxes_delta (bool _add = true) [inline]

Standard Constructor: if _add is false, the box is interpreted as an exclusion box. Otherwise it is stored in the table of boxes.

Definition at line 53 of file boxes_delta.h.

10.31.3.2 coco::boxes_delta::boxes_delta (const dbt_row & _b, bool _add = true) [inline]

Constructor: the box is described, including all additional information as dbt_row in the database format, if _add is false, the box is interpreted as an exclusion box. It is stored in the table box of boxes. The columns are

Name	Type	R/O	
x	vector<interval>	required	the box
exclusion box	bool	optional	default: false
contains optimum	bool	optional	default: false
eval region	bool	optional	default: false

Definition at line 67 of file boxes_delta.h.

10.31.3.3 coco::boxes_delta::boxes_delta (const std::vector< dbt_row > & _b, bool _add = true) [inline]

Constructor: the boxes are described, including all additional information as dbt_row in the database format. The parameter _b is a vector of boxes to be added. If _add is false, the boxes are interpreted as an exclusion boxes. They are stored in the table box of boxes. The columns are

Name	Type	R/O	Description	Default
x	vector<interval>	required	the box	
exclusion box	bool	optional	an exclusion box?	false
contains optimum	bool	optional	contains the optimum?	false
eval region	bool	optional	an eval region?	false

Definition at line 84 of file boxes_delta.h.

10.31.3.4 coco::boxes_delta::boxes_delta (const boxes_delta & __d) [inline]

Standard Copy Constructor

Definition at line 89 of file boxes_delta.h.

10.31.4 Member Function Documentation

10.31.4.1 void coco::table_delta::add (const t_line & _tl) [inline, inherited]

This method adds one table row.

Definition at line 95 of file table_delta.h.

10.31.4.2 void coco::table_delta::add (const std::string & _tn, const dbt_row & _r) [inline, inherited]

This method adds one row _r to the table _tn.

Definition at line 97 of file table_delta.h.

10.31.4.3 void coco::table_delta::add (const std::vector< t_line > & _tlv) [inline, inherited]

This method adds a list of table rows.

Definition at line 100 of file table_delta.h.

10.31.4.4 bool coco::boxes_delta::apply (work_node & _x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const [virtual]

Apply the delta with delta_id _d to work node _x. This will never be used, because the boxes_delta is converted to annotation_delta before the apply is performed.

Reimplemented from coco::table_delta.

Definition at line 35 of file boxes_delta.cc.

10.31.4.5 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.31.4.6 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.31.4.7 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.31.4.8 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.31.4.9 void coco::table_delta::convert (work_node & _x, delta_base *& _u) [inherited]

This method converts the table delta to an annotation_delta after the information is stored in the search database. The conversion is based on work_node _x, and the generated annotation_delta is returned via _u.

Definition at line 43 of file table_delta.cc.

10.31.4.10 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.31.4.11 void coco::boxes_delta::create_table (work_node & _x, vdbl::standard_table *& ptb, const std::string & __t) const [virtual]

This method creates the box table in the search database for the work_node _x. A pointer ptb to the created table is set. The parameter ___t for the table name is ignored.

Reimplemented from coco::table_delta.

Definition at line 44 of file boxes_delta.cc.

10.31.4.12 void coco::boxes_delta::destroy_copy (delta_base * __d) const [inline, virtual]

Clone Destructor

Reimplemented from coco::table_delta.

Definition at line 95 of file boxes_delta.h.

10.31.4.13 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.31.4.14 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.32.1 Detailed Description

This class is the base class of all caching backward evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on evaluator_base.

10.32.2 Member Typedef Documentation

10.32.2.1 typedef _Base::const_walker coco::cached_backward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 853 of file evaluator.h.

10.32.2.2 typedef _Base::node_data_type coco::cached_backward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 849 of file evaluator.h.

10.32.2.3 typedef _Base::return_value coco::cached_backward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 851 of file evaluator.h.

10.32.3 Member Function Documentation

10.32.3.1 virtual int coco::cached_backward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual]

This method is called right before all children of a node are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 921 of file evaluator.h.

10.32.3.2 virtual return_value coco::cached_backward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Definition at line 956 of file evaluator.h.

10.32.3.3 virtual void coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 925 of file evaluator.h.

10.32.3.4 int coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 879 of file evaluator.h.

10.32.3.5 virtual void coco::cached_backward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 910 of file evaluator.h.

10.32.3.6 virtual bool coco::cached_backward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 905 of file evaluator.h.

10.32.3.7 void coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 874 of file evaluator.h.

10.32.3.8 virtual int coco::coco::cached_evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 447 of file search_graph.cc.

10.32.3.9 int coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 862 of file evaluator.h.

10.32.3.10 virtual void coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 929 of file evaluator.h.

10.32.3.11 virtual const_walker coco::coco::cached_evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 451 of file search_graph.cc.

10.32.3.12 virtual int coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 940 of file evaluator.h.

10.32.3.13 virtual int coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 951 of file evaluator.h.

10.32.3.14 return_value coco::cached_backward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 891 of file evaluator.h.

10.32.3.15 int coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 885 of file evaluator.h.

10.32.3.16 void coco::cached_backward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 900 of file evaluator.h.

10.32.3.17 return_value coco::cached_backward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 896 of file evaluator.h.

10.32.4 Member Data Documentation

10.32.4.1 const variable_indicator* coco::coco::cached_evaluator_base::v_ind [protected, inherited]

For caching a variable indicator is needed to check which nodes need not be re-evaluated.

Definition at line 428 of file search_graph.cc.

10.33.1 Detailed Description

This class is the base class of all caching backward evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on evaluator_base.

10.33.2 Member Typedef Documentation

10.33.2.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 854 of file search_graph.cc.

10.33.2.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 850 of file search_graph.cc.

10.33.2.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 852 of file search_graph.cc.

10.33.3 Member Function Documentation

10.33.3.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.33.3.2 virtual return_value coco::coco::cached_backward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented in coco::model::lincoeff_visitor, coco::ithirdderBackwardEvaluator, coco::ider_eval, coco::ihessBackwardEvaluator, coco::thirdderBackwardEvaluator, coco::hessBackwardEvaluator, coco::der_eval, coco::islp2_eval_INTERNAL, coco::islp2_eval_INTERNAL, coco::islp_eval_INTERNAL, and coco::islp_eval_INTERNAL.

Definition at line 957 of file search_graph.cc.

10.33.3.3 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.33.3.4 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.33.3.5 virtual void coco::coco::cached_backward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented in coco::model::lincoeff_visitor, coco::ithirdderBackwardEvaluator, coco::ider_eval, coco::ihessBackwardEvaluator, coco::thirdderBackwardEvaluator, coco::hessBackwardEvaluator, coco::der_eval, coco::islp2_eval_INTERNAL, coco::islp2_eval_INTERNAL, coco::islp_eval_INTERNAL, and coco::islp_eval_INTERNAL.

Definition at line 911 of file search_graph.cc.

10.33.3.6 virtual bool coco::coco::cached_backward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented in coco::ithirdderBackwardEvaluator, coco::ider_eval, coco::ihessBackwardEvaluator, coco::thirdderBackwardEvaluator, coco::hessBackwardEvaluator, coco::der_eval, coco::islp2_eval_INTERNAL, coco::islp2_eval_INTERNAL, coco::islp_eval_INTERNAL, and coco::islp_eval_INTERNAL.

Definition at line 906 of file search_graph.cc.

10.33.3.7 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.33.3.8 virtual int coco::coco::cached_evaluator_base::preorder (const node_data_type & *__data*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 447 of file search_graph.cc.

10.33.3.9 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.33.3.10 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.33.3.11 virtual const_walker coco::coco::cached_evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 451 of file search_graph.cc.

10.33.3.12 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.33.3.13 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.33.3.14 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 892 of file search_graph.cc.

10.33.3.15 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.33.3.16 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.33.3.17 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter

`true`.

Definition at line 897 of file search_graph.cc.

10.33.4 Member Data Documentation

10.33.4.1 const variable_indicator* coco::coco::cached_evaluator_base::v_ind [protected, inherited]

For caching a variable indicator is needed to check which nodes need not be re-evaluated.

Definition at line 428 of file search_graph.cc.

10.34.1 Detailed Description

This class is the base class of all caching evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on _evaluator_base.

10.34.2 Member Typedef Documentation

10.34.2.1 typedef _Base::const_walker coco::cached_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 435 of file evaluator.h.

10.34.2.2 typedef _Tp coco::coco::_evaluator_base::data_type [inherited]

The data_type specifies the type of the internal data of the evaluator.

Definition at line 306 of file search_graph.cc.

10.34.2.3 typedef _Base::node_data_type coco::cached_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 431 of file evaluator.h.

10.34.2.4 typedef _Base::return_value coco::cached_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 433 of file evaluator.h.

10.34.3 Constructor & Destructor Documentation

10.34.3.1 coco::cached_evaluator_base::cached_evaluator_base ( ) [inline]

Standard Constructor

Definition at line 455 of file evaluator.h.

10.34.3.2 coco::cached_evaluator_base::cached_evaluator_base (const _Tp & *__x*, const variable_indicator & *__v*) [inline]

Constructor, which initializes the internal data and the variable indicator

Definition at line 458 of file evaluator.h.

10.34.3.3 coco::cached_evaluator_base::cached_evaluator_base (const _Self & *__x*) [inline]

Standard Copy Constructor

Definition at line 461 of file evaluator.h.

10.34.3.4 virtual coco::cached_evaluator_base::~cached_evaluator_base ( ) [inline, virtual]

Standard Destructor

Definition at line 464 of file evaluator.h.

10.34.4 Member Function Documentation

10.34.4.1 virtual int coco::coco::_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 360 of file search_graph.cc.

10.34.4.2 virtual void coco::coco::_evaluator_base::postorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 365 of file search_graph.cc.

10.34.4.3 virtual int coco::cached_evaluator_base::preorder (const node_data_type & __data) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 446 of file evaluator.h.

10.34.4.4 virtual const_walker coco::cached_evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 450 of file evaluator.h.

10.34.4.5 virtual return_value coco::coco::_evaluator_base::value ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 337 of file search_graph.cc.

10.34.4.6 virtual int coco::coco::_evaluator_base::vcollect (const return_value & __cresult) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 349 of file search_graph.cc.

10.34.4.7 virtual return_value coco::coco::_evaluator_base::vvalue ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 333 of file search_graph.cc.

10.34.5 Member Data Documentation

10.34.5.1 _Tp coco::coco::_evaluator_base::eval_data [protected, inherited]

The internal data of the evaluator

Definition at line 317 of file search_graph.cc.

10.34.5.2 const variable_indicator* coco::cached_evaluator_base::v_ind [protected]

For caching a variable indicator is needed to check which nodes need not be re-evaluated.

Definition at line 427 of file evaluator.h.

The documentation for this class was generated from the following file:

- evaluator.h

10.35 coco::coco::cached_evaluator_base Class Reference

Base class of all caching evaluators.

10.35.1 Detailed Description

This class is the base class of all caching evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on _evaluator_base.

10.35.2 Member Typedef Documentation

10.35.2.1 typedef _Base::const_walker coco::coco::cached_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::cached_backward_evaluator_base, coco::cached_backward_evaluator_base, coco::coco::cached_forward_evaluator_base, and coco::cached_forward_evaluator_base.

Definition at line 436 of file search_graph.cc.

10.35.2.2 typedef _Tp coco::coco::_evaluator_base::data_type [inherited]

The data_type specifies the type of the internal data of the evaluator.

Definition at line 306 of file search_graph.cc.

10.35.2.3 typedef _Base::node_data_type coco::coco::cached_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::cached_backward_evaluator_base, coco::cached_backward_evaluator_base, coco::coco::cached_forward_evaluator_base, and coco::cached_forward_evaluator_base.

Definition at line 432 of file search_graph.cc.

10.35.2.4 typedef _Base::return_value coco::coco::cached_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::cached_backward_evaluator_base, coco::cached_backward_evaluator_base, coco::coco::cached_forward_evaluator_base, and coco::cached_forward_evaluator_base.

Definition at line 434 of file search_graph.cc.

Definition at line 465 of file search_graph.cc.

10.35.4 Member Function Documentation

10.35.4.1 virtual int coco::coco::_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 360 of file search_graph.cc.

10.35.4.2 virtual void coco::coco::_evaluator_base::postorder (const node_data_type & *__data*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 365 of file search_graph.cc.

10.35.4.3 virtual int coco::coco::cached_evaluator_base::preorder (const node_data_type & *__data*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 447 of file search_graph.cc.

10.35.4.4 virtual const_walker coco::coco::cached_evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 451 of file search_graph.cc.

10.35.4.5 virtual return_value coco::coco::_evaluator_base::value ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 337 of file search_graph.cc.

10.35.4.6 virtual int coco::coco::_evaluator_base::vcollect (const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 349 of file search_graph.cc.

10.35.4.7 virtual return_value coco::coco::_evaluator_base::vvalue ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 333 of file search_graph.cc.

10.35.5 Member Data Documentation

10.35.5.1 _Tp coco::coco::_evaluator_base::eval_data [protected, inherited]

The internal data of the evaluator

Definition at line 317 of file search_graph.cc.

10.36.1 Detailed Description

This class is the base class of all non-caching forward evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on evaluator_base.

10.36.2 Member Typedef Documentation

10.36.2.1 typedef _Base::const_walker coco::cached_forward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 723 of file evaluator.h.

10.36.2.2 typedef _Base::node_data_type coco::cached_forward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 719 of file evaluator.h.

10.36.2.3 typedef _Base::return_value coco::cached_forward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 721 of file evaluator.h.

10.36.3 Member Function Documentation

10.36.3.1 virtual void coco::cached_forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 796 of file evaluator.h.

10.36.3.2 virtual return_value coco::cached_forward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Definition at line 830 of file evaluator.h.

10.36.3.3 virtual void coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 804 of file evaluator.h.

10.36.3.4 int coco::cached_forward_evaluator_base::collect (const node_data_type & *__data,* const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 750 of file evaluator.h.

10.36.3.5 virtual void coco::cached_forward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 781 of file evaluator.h.

10.36.3.6 virtual int coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 792 of file evaluator.h.

10.36.3.7 virtual bool coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 776 of file evaluator.h.

10.36.3.8 void coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 744 of file evaluator.h.

10.36.3.9 virtual int coco::coco::cached_evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 447 of file search_graph.cc.

10.36.3.10 int coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 732 of file evaluator.h.

10.36.3.11 virtual void coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 800 of file evaluator.h.

10.36.3.12 virtual const_walker coco::coco::cached_evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 451 of file search_graph.cc.

10.36.3.13 virtual int coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 814 of file evaluator.h.

10.36.3.14 virtual int coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 826 of file evaluator.h.

10.36.3.15 return_value coco::cached_forward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 762 of file evaluator.h.

10.36.3.16 int coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 756 of file evaluator.h.

10.36.3.17 void coco::cached_forward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 771 of file evaluator.h.

10.36.3.18 return_value coco::cached_forward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter true.

Definition at line 767 of file evaluator.h.

10.36.4 Member Data Documentation

10.36.4.1 const variable_indicator* coco::coco::cached_evaluator_base::v_ind [protected, inherited]

For caching a variable indicator is needed to check which nodes need not be re-evaluated.

Definition at line 428 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.37.1 Detailed Description

This class is the base class of all non-caching forward evaluators. Basically, it is a visitor to expression_-node nodes in a DAG, based on evaluator_base.

10.37.2 Member Typedef Documentation

10.37.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 724 of file search_graph.cc.

10.37.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data-_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 720 of file search_graph.cc.

10.37.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::cached_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 722 of file search_graph.cc.

10.37.3 Member Function Documentation

10.37.3.1 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.37.3.2 virtual return_value coco::coco::cached_forward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented in coco::model::detect_0chain_visitor, coco::polsppt_eval, coco::ithirdderForwardEvaluator, coco::func_id_eval, coco::func_islp_eval, coco::func_islp2_eval, coco::ihessForwardEvaluator, coco::thirdderForwardEvaluator, coco::hessForwardEvaluator, coco::func_d_eval, coco::defdom_eval, coco::iderf_eval, coco::xxxNumber_eval, coco::dd1f_interval_eval, coco::interval_eval, coco::func_eval, coco::infbound_eval, coco::analyticd_eval, coco::b_interval_eval, coco::Islope_eval, coco::cinterval_eval, coco::dfunc_eval, coco::ithirdderPreparationEvaluator, coco::thirdderPreparationEvaluator, coco::prep_islp2_eval, coco::ihessPreparationEvaluator, coco::hessPreparationEvaluator, coco::prep_islp_eval, coco::prep_id_eval, and coco::prep_d_eval.

Definition at line 831 of file search_graph.cc.

10.37.3.3 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.37.3.4 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.37.3.5 virtual void coco::coco::cached_forward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented in coco::model::detect_0chain_visitor, coco::ihessForwardEvaluator, coco::ithirdderForwardEvaluator, coco::func_islp2_eval, coco::hessForwardEvaluator, coco::func_id_eval, coco::xxxNumber_eval, coco::thirdderForwardEvaluator, coco::func_d_eval, coco::func_islp_eval, coco::defdom_eval, coco::polsppt_eval, coco::iderf_eval, coco::Islope_eval, coco::dd1f_interval_eval, coco::interval_eval, coco::func_eval, coco::dfunc_eval, coco::analyticd_eval, coco::b_interval_eval, coco::cinterval_eval, coco::infbound_eval, coco::prep_islp_eval, coco::ithirdderPreparationEvaluator, coco::thirdderPreparationEvaluator, coco::prep_id_eval, coco::prep_islp2_eval, coco::prep_d_eval, coco::ihessPreparationEvaluator, and coco::hessPreparationEvaluator.

Definition at line 782 of file search_graph.cc.

10.37.3.6 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.37.3.7 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented in coco::ithirdderForwardEvaluator, coco::func_islp2_eval, coco::thirdderForwardEvaluator, coco::ihessForwardEvaluator, coco::hessForwardEvaluator, coco::func_id_eval, coco::func_d_eval, coco::defdom_eval, coco::xxxNumber_eval, coco::polsppt_eval, coco::iderf_eval, coco::dd1f_interval_eval, coco::Islope_eval, coco::interval_eval, coco::func_eval, coco::dfunc_eval, coco::analyticd_eval, coco::b_interval_eval, coco::cinterval_eval, and coco::infbound_eval.

Definition at line 777 of file search_graph.cc.

10.37.3.8 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.37.3.9 virtual int coco::coco::cached_evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 447 of file search_graph.cc.

10.37.3.10 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.37.3.11 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.37.3.12 virtual const_walker coco::coco::cached_evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 451 of file search_graph.cc.

10.37.3.13 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.37.3.14 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.37.3.15 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.37.3.16 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.37.3.17 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.37.3.18 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.37.4 Member Data Documentation

10.37.4.1 const variable_indicator* coco::coco::cached_evaluator_base::v_ind [protected, inherited]

For caching a variable indicator is needed to check which nodes need not be re-evaluated.

Definition at line 428 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.38 coco::calc_pf_star Class Reference

Stored procedure calculating the pf∗ value of a box.

`#include <pfstar.h>`

Public Types

- typedef search_graph_context context
- typedef double return_type

Public Member Functions

- calc_pf_star (vdbl::colid _l, vdbl::colid _w)
- calc_pf_star (const calc_pf_star &_i)
- virtual ∼calc_pf_star ()
- double operator() () const
- double def () const
- void setcontext (const context ∗c, const vdbl::row ∗r)

10.38.1 Detailed Description

This class is used as a stored procedure (vdbl::method) for calculating the pf∗ value of a subproblem.

10.38.2 Member Typedef Documentation

10.38.2.1 typedef search_graph_context coco::calc_pf_star::context

The evaluation context type

Definition at line 47 of file pfstar.h.

10.38.2.2 typedef double coco::calc_pf_star::return_type

The return type of the operator(), i.e. the function class.

Definition at line 63 of file pfstar.h.

10.38.3 Constructor & Destructor Documentation

10.38.3.1 coco::calc_pf_star::calc_pf_star (vdbl::colid _l, vdbl::colid _w) [inline]

Constructor setting the relevant column id.

Definition at line 66 of file pfstar.h.

10.38.3.2 coco::calc_pf_star::calc_pf_star (const calc_pf_star & *_i*) [inline]

Standard Copy Constructor

Definition at line 69 of file pfstar.h.

10.38.3.3 virtual coco::calc_pf_star::~calc_pf_star ( ) [inline, virtual]

Standard Destructor

Definition at line 73 of file pfstar.h.

10.38.4 Member Function Documentation

10.38.4.1 double coco::calc_pf_star::def ( ) const [inline]

Method, which computes the default value of the stored procedure

Definition at line 78 of file pfstar.h.

10.38.4.2 double coco::calc_pf_star::operator() ( ) const

Evaluation operator, which computes the value of the stored procedure

Definition at line 36 of file pfstar.cc.

10.38.4.3 void coco::calc_pf_star::setcontext (const context * *c*, const vdbl::row * *r*) [inline]

This method initializes the evaluation context and the row, preparing for the evaluation.

Definition at line 81 of file pfstar.h.

The documentation for this class was generated from the following files:

- pfstar.h
- pfstar.cc

10.39 coco::certificate Class Reference

The certificate class (certifies deltas for rigorous mode operation)

`#include <api_certbase.h>`

Public Member Functions

- certificate ()
- certificate (const certificate_base &__c)
- certificate (const certificate &__c)
- ~certificate ()
- std::string get_contents () const
- const certificate_base * get_base () const

- bool verify (const work_node &_x) const
- certificate & operator= (const certificate &_c)
- bool operator== (const certificate &_c) const
- bool operator!= (const certificate &_c) const

Friends

- class certificate_base
- class ie_return_type
- std::ostream & operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.

10.39.1 Detailed Description

The certificate class is used to certify deltas in rigorous mode. It is, like the delta class, designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded. Certificates are stored alongside the corresponding deltas in the table `deltas`.

10.39.2 Constructor & Destructor Documentation

10.39.2.1 coco::certificate::certificate ( ) [inline]

Standard Constructor

Definition at line 62 of file api_certbase.h.

10.39.2.2 coco::certificate::certificate (const certificate_base & *__c*)

Constructor, which constructs a certificate from a certificate_base. The clone operation for the certificate_base will be called in that process.

10.39.2.3 coco::certificate::certificate (const certificate & *__c*)

Copy Constructor, which constructs a new certificate from an existing certificate. The clone operation for the certificate_base will be called in that process, effectively overloading the copy constructor for the certificate_base.

10.39.2.4 coco::certificate::~certificate ( )

Destructor, which frees the `_c` using `delete`

10.39.3 Member Function Documentation

10.39.3.1 const certificate_base* coco::certificate::get_base ( ) const

Return the certificate_base stored in this wrapper

10.39.3.2 std::string coco::certificate::get_contents ( ) const

Retrieve the contents information (the certificate type) for this certificate.

10.39.3.3 bool coco::certificate::operator!= (const certificate & *_c*) const

10.39.3.4 certificate& coco::certificate::operator= (const certificate & *_c*)

Assignment operator, which uses the clone operation for the certificate_base, effectively overloading the assignment operator for the certificate_base.

10.39.3.5 bool coco::certificate::operator== (const certificate & *_c*) const

Comparison operators

10.39.3.6 bool coco::certificate::verify (const work_node & *_x*) const

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x.

10.39.4 Friends And Related Function Documentation

10.39.4.1 friend class certificate_base [friend]

Definition at line 102 of file api_certbase.h.

10.39.4.2 friend class ie_return_type [friend]

Definition at line 103 of file api_certbase.h.

10.39.4.3 std::ostream& operator<< (std::ostream & *o*, const certificate & *t*) [friend]

Stream output operator for certificates, which calls the get_contents method of the certificate.

Definition at line 112 of file api_certbase.h.

The documentation for this class was generated from the following file:

- api_certbase.h

10.40.1 Detailed Description

The certificate class is used to certify deltas in rigorous mode. It is, like the delta class, designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded. Certificates are stored alongside the corresponding deltas in the table `deltas`.

Definition at line 54 of file search_graph.cc.

10.40.2 Constructor & Destructor Documentation

10.40.2.1 coco::coco::certificate::certificate ( ) [inline]

Standard Constructor

Definition at line 62 of file search_graph.cc.

10.40.2.2 coco::certificate::certificate (const certificate_base & *__c*) [inline]

Constructor, which constructs a certificate from a certificate_base. The clone operation for the certificate_base will be called in that process.

Definition at line 41 of file api_cert.h.

10.40.2.3 coco::certificate::certificate (const certificate & *__c*) [inline]

Copy Constructor, which constructs a new certificate from an existing certificate. The clone operation for the certificate_base will be called in that process, effectively overloading the copy constructor for the certificate_base.

Definition at line 43 of file api_cert.h.

10.40.2.4 coco::certificate::~certificate ( ) [inline]

Destructor, which frees the `_c` using `delete`

Definition at line 49 of file api_cert.h.

10.40.2.5 coco::coco::certificate::certificate ( ) [inline]

Standard Constructor

Definition at line 62 of file search_graph.cc.

10.40.2.6 coco::coco::certificate::certificate (const certificate_base & *__c*)

Constructor, which constructs a certificate from a certificate_base. The clone operation for the certificate_base will be called in that process.

10.40.2.7 coco::coco::certificate::certificate (const certificate & *__c*)

Copy Constructor, which constructs a new certificate from an existing certificate. The clone operation for the certificate_base will be called in that process, effectively overloading the copy constructor for the certificate_base.

10.40.2.8 coco::coco::certificate::~certificate ( )

Destructor, which frees the _c using `delete`

10.40.2.9 coco::coco::certificate::certificate ( ) [inline]

Standard Constructor

Definition at line 62 of file search_graph.cc.

10.40.2.10 coco::coco::certificate::certificate (const certificate_base & *__c*)

Constructor, which constructs a certificate from a certificate_base. The clone operation for the certificate_base will be called in that process.

10.40.2.11 coco::coco::certificate::certificate (const certificate & *__c*)

Copy Constructor, which constructs a new certificate from an existing certificate. The clone operation for the certificate_base will be called in that process, effectively overloading the copy constructor for the certificate_base.

10.40.2.12 coco::coco::certificate::~certificate ( )

Destructor, which frees the _c using `delete`

10.40.2.13 coco::coco::certificate::certificate ( ) [inline]

Standard Constructor

Definition at line 62 of file search_graph.cc.

10.40.2.14 coco::coco::certificate::certificate (const certificate_base & *__c*)

Constructor, which constructs a certificate from a certificate_base. The clone operation for the certificate_base will be called in that process.

10.40.2.15 coco::coco::certificate::certificate (const certificate & *__c*)

Copy Constructor, which constructs a new certificate from an existing certificate. The clone operation for the certificate_base will be called in that process, effectively overloading the copy constructor for the certificate_base.

10.40.2.16 coco::coco::certificate::~certificate ( )

Destructor, which frees the _c using `delete`

10.40.3 Member Function Documentation

10.40.3.1 const certificate_base * coco::certificate::get_base ( ) const [inline]

Return the certificate_base stored in this wrapper

Definition at line 67 of file api_cert.h.

10.40.3.2 const certificate_base* coco::coco::certificate::get_base ( ) const

Return the certificate_base stored in this wrapper

10.40.3.3 const certificate_base* coco::coco::certificate::get_base ( ) const

Return the certificate_base stored in this wrapper

10.40.3.4 const certificate_base* coco::coco::certificate::get_base ( ) const

Return the certificate_base stored in this wrapper

10.40.3.5 std::string coco::certificate::get_contents ( ) const [inline]

Retrieve the contents information (the certificate type) for this certificate.

Definition at line 65 of file api_cert.h.

10.40.3.6 std::string coco::coco::certificate::get_contents ( ) const

Retrieve the contents information (the certificate type) for this certificate.

10.40.3.7 std::string coco::coco::certificate::get_contents ( ) const

Retrieve the contents information (the certificate type) for this certificate.

10.40.3.8 std::string coco::coco::certificate::get_contents ( ) const

Retrieve the contents information (the certificate type) for this certificate.

10.42.1 Detailed Description

Base class for the certificates, which is wrapped by the certificate class since copy constructors cannot directly be overloaded.

Definition at line 124 of file search_graph.cc.

10.42.2 Constructor & Destructor Documentation

10.42.2.1 coco::coco::certificate_base::certificate_base ( ) [inline]

Standard Constructor

Definition at line 132 of file search_graph.cc.

10.42.2.2 coco::coco::certificate_base::certificate_base (const std::string & *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 134 of file search_graph.cc.

10.42.2.3 coco::coco::certificate_base::certificate_base (const char * *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 136 of file search_graph.cc.

10.42.2.4 coco::coco::certificate_base::certificate_base (const certificate_base & *__c*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 138 of file search_graph.cc.

10.42.2.5 coco::coco::certificate_base::certificate_base ( ) [inline]

Standard Constructor

Definition at line 132 of file search_graph.cc.

10.42.2.6 coco::coco::certificate_base::certificate_base (const std::string & *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 134 of file search_graph.cc.

10.42.2.7 coco::coco::certificate_base::certificate_base (const char * *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 136 of file search_graph.cc.

10.42.2.8 coco::coco::certificate_base::certificate_base (const certificate_base & *__c*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 138 of file search_graph.cc.

10.42.2.9 coco::coco::certificate_base::certificate_base ( ) [inline]

Standard Constructor

Definition at line 132 of file search_graph.cc.

10.42.2.10 coco::coco::certificate_base::certificate_base (const std::string & *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 134 of file search_graph.cc.

10.42.2.11 coco::coco::certificate_base::certificate_base (const char * *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 136 of file search_graph.cc.

10.42.2.12 coco::coco::certificate_base::certificate_base (const certificate_base & *__c*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 138 of file search_graph.cc.

10.42.2.13 coco::coco::certificate_base::certificate_base ( ) [inline]

Standard Constructor

Definition at line 132 of file search_graph.cc.

10.42.2.14 coco::coco::certificate_base::certificate_base (const std::string & *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 134 of file search_graph.cc.

10.42.2.15 coco::coco::certificate_base::certificate_base (const char * *c*) [inline]

Constructor, explicitly setting the contents to c

Definition at line 136 of file search_graph.cc.

10.42.2.16 coco::coco::certificate_base::certificate_base (const certificate_base & *__c*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 138 of file search_graph.cc.

10.42.3 Member Function Documentation

10.42.3.1 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.42.3.2 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.42.3.3 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.42.3.4 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.42.3.5 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.42.3.6 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.42.3.7 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.42.3.8 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.42.3.9 virtual certificate_base* coco::coco::certificate_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 146 of file search_graph.cc.

10.42.3.10 virtual certificate_base* coco::coco::certificate_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 146 of file search_graph.cc.

10.42.3.11 virtual certificate_base* coco::coco::certificate_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 146 of file search_graph.cc.

10.42.3.12 virtual certificate_base* coco::coco::certificate_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 146 of file search_graph.cc.

10.42.3.13 virtual bool coco::coco::certificate_base::verify (const work_node & _x) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. Will be overloaded.

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 169 of file search_graph.cc.

10.42.3.14 virtual bool coco::coco::certificate_base::verify (const work_node & _x) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. Will be overloaded.

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 169 of file search_graph.cc.

10.42.3.15 virtual bool coco::coco::certificate_base::verify (const work_node & _x) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. Will be overloaded.

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 169 of file search_graph.cc.

10.42.3.16 virtual bool coco::coco::certificate_base::verify (const work_node & _x) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. Will be overloaded.

Reimplemented in coco::rigorous_module_certificate, coco::compound_certificate, coco::split_certificate, and coco::no_certificate.

Definition at line 169 of file search_graph.cc.

10.42.4 Member Data Documentation

10.42.4.1 std::string coco::coco::certificate_base::_contents [protected]

The contents (descriptive string, type) of this certificate

Definition at line 128 of file search_graph.cc.

The documentation for this class was generated from the following file:

- api_certbase.h

10.43 coco::checking_my Struct Reference

`#include <interval_boost.h>`

Static Public Member Functions

- static T pos_inf ()

10.47.1 Member Typedef Documentation

10.47.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.47.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.47.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.47.2 Constructor & Destructor Documentation

10.47.2.1 coco::cinterval_eval::cinterval_eval (const std::vector< cinterval > & __x, const variable_indicator & __v, const model & __m, std::vector< cinterval > * __c) [inline]

Definition at line 116 of file cint_evaluator.h.

10.47.2.2 coco::cinterval_eval::cinterval_eval (const cinterval_eval & __v) [inline]

Definition at line 128 of file cint_evaluator.h.

10.47.2.3 coco::cinterval_eval::~cinterval_eval ( ) [inline]

Definition at line 130 of file cint_evaluator.h.

10.47.3 Member Function Documentation

10.47.3.1 void coco::cinterval_eval::calculate (const expression_node & __data) [inline]

Definition at line 193 of file cint_evaluator.h.

10.47.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.47.3.3 cinterval coco::cinterval_eval::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< cinterval_eval_type, expression_node, cinterval, expression_const_walker >.

Definition at line 667 of file cint_evaluator.h.

10.47.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.47.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.47.3.6 void coco::cinterval_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< cinterval_eval_type, expression_node, cinterval, expression_const_walker >.

Definition at line 135 of file cint_evaluator.h.

10.47.3.7 int coco::cinterval_eval::initialize (const expression_node & __data) [inline]

Definition at line 137 of file cint_evaluator.h.

10.47.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.47.3.9 bool coco::cinterval_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< cinterval_eval_type, expression_node, cinterval, expression_const_walker >.

Definition at line 70 of file cint_evaluator.h.

10.47.3.10 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.47.3.11 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.47.3.12 void coco::cinterval_eval::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 203 of file cint_evaluator.h.

10.47.3.13 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.47.3.14 expression_const_walker coco::cinterval_eval::short_cut_to (const expression_node & __data) [inline]

Definition at line 132 of file cint_evaluator.h.

10.47.3.15 int coco::cinterval_eval::update (const cinterval & __rval) [inline]

Definition at line 219 of file cint_evaluator.h.

10.47.3.16 int coco::cinterval_eval::update (const expression_node & __data, const cinterval & __rval) [inline]

Definition at line 225 of file cint_evaluator.h.

10.47.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.47.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.47.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.47.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.47.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.47.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

- cint_evaluator.h

10.48 coco::cinterval_eval_type Struct Reference

10.51 coco::coconut_random_f Struct Reference

`#include <coconut_random.h>`

Public Member Functions

- interval operator() (const interval &i) const
- double operator() (double l, double u) const
- double operator() (double u) const
- double operator() () const
- int operator() (int n) const
- int operator() (long int n) const
- size_t operator() (size_t n) const
- coconut_random_f (double _b=10.0, double _a=0.9)

Public Attributes

- double beta
- double alpha

10.51.1 Detailed Description

This is a class which can be used as random number object in STL like algorithms.

10.51.2 Constructor & Destructor Documentation

10.51.2.1 coco::coconut_random_f::coconut_random_f (double _b = 10.0, double _a = 0.9) [inline]

Definition at line 275 of file coconut_random.h.

10.51.3 Member Function Documentation

10.51.3.1 interval coco::coconut_random_f::operator() (const interval & i) const [inline]

Definition at line 254 of file coconut_random.h.

10.51.3.2 double coco::coconut_random_f::operator() (double l, double u) const [inline]

Definition at line 257 of file coconut_random.h.

10.51.3.3 double coco::coconut_random_f::operator() (double u) const [inline]

Definition at line 260 of file coconut_random.h.

10.51.3.4 double coco::coconut_random_f::operator() ( ) const [inline]

Definition at line 263 of file coconut_random.h.

10.51.3.5 int coco::coconut_random_f::operator() (int n) const [inline]

Definition at line 266 of file coconut_random.h.

10.51.3.6 int coco::coconut_random_f::operator() (long int n) const [inline]

Definition at line 269 of file coconut_random.h.

10.51.3.7 size_t coco::coconut_random_f::operator() (size_t n) const [inline]

Definition at line 272 of file coconut_random.h.

10.51.4 Member Data Documentation

10.51.4.1 double coco::coconut_random_f::alpha

Definition at line 252 of file coconut_random.h.

10.51.4.2 double coco::coconut_random_f::beta

Definition at line 251 of file coconut_random.h.

The documentation for this struct was generated from the following file:

- coconut_random.h

10.52 coco::compare_intervals Class Reference

Public Types

- typedef interval first_argument_type
- typedef interval second_argument_type
- typedef bool result_type

Public Member Functions

- bool operator() (const interval &a, const interval &b)

10.52.1 Member Typedef Documentation

10.52.1.1 typedef interval coco::compare_intervals::first_argument_type

Definition at line 151 of file dagd1func_bp.cc.

10.52.1.2 typedef bool coco::compare_intervals::result_type

Definition at line 153 of file dagd1func_bp.cc.

10.52.1.3 typedef interval coco::compare_intervals::second_argument_type

Definition at line 152 of file dagd1func_bp.cc.

10.52.2 Member Function Documentation

10.52.2.1 bool coco::compare_intervals::operator() (const interval & *a*, const interval & *b*) [inline]

Definition at line 155 of file dagd1func_bp.cc.

The documentation for this class was generated from the following file:

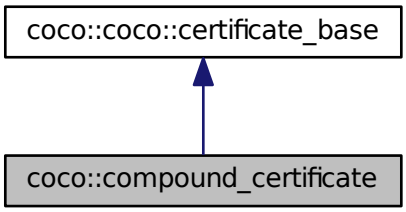
- dagd1func_bp.cc

10.53 coco::compound_certificate Class Reference

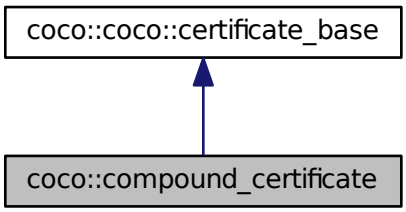
The certificate for deltas formed by compressing bound_delta entries.

`#include <api_cert.h>`

Inheritance diagram for coco::compound_certificate:



Collaboration diagram for coco::compound_certificate:



Public Member Functions

- compound_certificate (bool verified)

- virtual std::string get_contents () const
- virtual std::string get_contents () const
- virtual std::string get_contents () const

Protected Attributes

- std::string _contents

10.53.1 Detailed Description

The compound certificate for compound deltas generated by management modules

10.53.2 Constructor & Destructor Documentation

10.53.2.1 coco::compound_certificate::compound_certificate (bool *verified*) [inline]

Constructor setting the `is_verfied` information to `verified`

Definition at line 210 of file api_cert.h.

10.53.2.2 coco::compound_certificate::compound_certificate (const compound_certificate & *__c*) [inline]

Standard Copy Constructor

Definition at line 213 of file api_cert.h.

10.53.2.3 virtual coco::compound_certificate::~compound_certificate ( ) [inline, virtual]

Standard Destructor

Definition at line 222 of file api_cert.h.

10.53.3 Member Function Documentation

10.53.3.1 void coco::compound_certificate::destroy_copy (certificate_base * *__c*) const [inline]

Clone Destructor

Definition at line 233 of file api_cert.h.

10.53.3.2 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.53.3.3 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.53.3.4 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.53.3.5 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.53.3.6 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.53.3.7 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.53.3.8 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.53.3.9 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.53.3.10 compound_certificate* coco::compound_certificate::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::certificate_base.

Definition at line 225 of file api_cert.h.

10.53.3.11 bool coco::compound_certificate::operator!= (const certificate_base & *_c*) const [inline]

Definition at line 245 of file api_cert.h.

10.53.3.12 bool coco::compound_certificate::operator!= (const compound_certificate & *_c*) const [inline]

Definition at line 252 of file api_cert.h.

10.53.3.13 bool coco::compound_certificate::operator== (const certificate_base & *_c*) const [inline]

Comparison operators

Definition at line 242 of file api_cert.h.

10.53.3.14 bool coco::compound_certificate::operator== (const compound_certificate & *_c*) const [inline]

Comparison operators

Definition at line 250 of file api_cert.h.

10.53.3.15 bool coco::compound_certificate::verify (const work_node & *_x*) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. In this case the value is recorded in the is_verified member.

Reimplemented from coco::coco::certificate_base.

Definition at line 239 of file api_cert.h.

10.53.4 Member Data Documentation

10.53.4.1 std::string coco::coco::certificate_base::_contents [protected, inherited]

The contents (descriptive string, type) of this certificate

Definition at line 128 of file search_graph.cc.

The documentation for this class was generated from the following file:

- api_cert.h

10.54 coco::coco::work_node::constraint_iterator_base Class Reference

The base class for work_node::constraint_iterator and work_node::constraint_const_iterator.

Public Types

- typedef std::bidirectional_iterator_tag iterator_category
- typedef _TW value_type
- typedef _TR reference
- typedef _TP pointer
- typedef size_t size_type
- typedef ptrdiff_t difference_type

Public Member Functions

- constraint_iterator_base ()
- constraint_iterator_base (_Reference cs, unsigned int tp)
- constraint_iterator_base (const _Self &__c)
- ~constraint_iterator_base ()
- reference operator* () const
- pointer operator-> () const
- bool operator== (const _Self &_c)
- bool operator!= (const _Self &_c)
- _Self & set (const _Iterator &_c)
- _Self & operator++ ()
- _Self operator++ (int)
- _Self & operator-- ()
- _Self operator-- (int)
- _Self & operator= (const _Self &_c)

10.54.1 Detailed Description

This is the base class for work_node::constraint_iterator and work_node::constraint_const_iterator.

See also

work_node::get_begin

10.54.2 Member Typedef Documentation

10.54.2.1 typedef ptrdiff_t coco::coco::work_node::constraint_iterator_base::difference_type

These types are needed for an iterator.

Definition at line 849 of file search_graph.cc.

10.54.2.2 typedef std::bidirectional_iterator_tag coco::coco::work_node::constraint_iterator_base::iterator_category

These types are needed for an iterator.

Definition at line 842 of file search_graph.cc.

10.54.2.3 typedef _TP coco::coco::work_node::constraint_iterator_base::pointer

These types are needed for an iterator.

Definition at line 846 of file search_graph.cc.

10.54.2.4 typedef _TR coco::coco::work_node::constraint_iterator_base::reference

These types are needed for an iterator.

Definition at line 845 of file search_graph.cc.

10.54.2.5 typedef size_t coco::coco::work_node::constraint_iterator_base::size_type

These types are needed for an iterator.

Definition at line 848 of file search_graph.cc.

10.54.2.6 typedef _TW coco::coco::work_node::constraint_iterator_base::value_type

These types are needed for an iterator.

Definition at line 844 of file search_graph.cc.

10.54.3 Constructor & Destructor Documentation

10.54.3.1 coco::coco::work_node::constraint_iterator_base::constraint_iterator_base ( ) [inline]

Standard Constructor

Definition at line 854 of file search_graph.cc.

10.54.3.2 coco::coco::work_node::constraint_iterator_base::constraint_iterator_base (_Reference *cs*, unsigned int *tp*) [inline]

Constructor, which initializes the vector with `cs` and the type with `tp`.

Definition at line 857 of file search_graph.cc.

10.54.3.3 coco::coco::work_node::constraint_iterator_base::constraint_iterator_base (const _Self & __c) [inline]

Standard Copy Constructor

Definition at line 860 of file search_graph.cc.

10.54.3.4 coco::coco::work_node::constraint_iterator_base::~constraint_iterator_base ( ) [inline]

Standard Destructor

Definition at line 864 of file search_graph.cc.

10.54.4 Member Function Documentation

10.54.4.1 bool coco::coco::work_node::constraint_iterator_base::operator!= (const _Self & _c) [inline]

Disequality Comparison Operator

Definition at line 876 of file search_graph.cc.

10.54.4.2 reference coco::coco::work_node::constraint_iterator_base::operator* ( ) const [inline]

Dereference Operator

Definition at line 867 of file search_graph.cc.

10.54.4.3 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self & coco::work_node::constraint_iterator_base::operator++ ( ) [inline]

Increment operator: go to the next constraint of the specified type

Definition at line 581 of file search_node.hpp.

10.54.4.4 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self coco::work_node::constraint_iterator_base::operator++ (int) [inline]

Increment operator: go to the next constraint of the specified type

Definition at line 596 of file search_node.hpp.

10.54.4.5 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self & coco::work_node::constraint_iterator_base::operator-- ( ) [inline]

Decrement operator: go to the previous constraint of the specified type

Definition at line 606 of file search_node.hpp.

10.54.4.6 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self coco::work_node::constraint_iterator_base::operator-- (int) [inline]

Decrement operator: go to the previous constraint of the specified type

Definition at line 625 of file search_node.hpp.

10.54.4.7 pointer coco::coco::work_node::constraint_iterator_base::operator-> ( ) const [inline]

Arrow Operator

Definition at line 869 of file search_graph.cc.

10.54.4.8 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self & coco::work_node::constraint_iterator_base::operator= (const _Self & *_c*) [inline]

Standard Assignment Operator

Definition at line 635 of file search_node.hpp.

10.54.4.9 bool coco::coco::work_node::constraint_iterator_base::operator== (const _Self & *_c*) [inline]

Equality Comparison Operator

Definition at line 872 of file search_graph.cc.

10.54.4.10 work_node::constraint_iterator_base< _TW, _TV, _VR, _TP, _TR, _TI >::_Self & coco::work_node::constraint_iterator_base::set (const _Iterator & *_c*) [inline]

This method sets the constraint_iterator to the first constraint of the specified type, which is not before _c.

Definition at line 567 of file search_node.hpp.

The documentation for this class was generated from the following files:

- search_node.h
- search_node.hpp

10.55 coco::work_node::constraint_iterator_base Class Reference

The base class for work_node::constraint_iterator and work_node::constraint_const_iterator.

`#include <search_node.h>`

Public Types

10.55.1 Detailed Description

This is the base class for work_node::constraint_iterator and work_node::constraint_const_iterator.

See also

work_node::get_begin

10.55.2 Member Typedef Documentation

10.55.2.1 typedef ptrdiff_t coco::work_node::constraint_iterator_base::difference_type

These types are needed for an iterator.

Definition at line 849 of file search_node.h.

10.55.2.2 typedef std::bidirectional_iterator_tag coco::work_node::constraint_iterator_base::iterator_category

These types are needed for an iterator.

Definition at line 842 of file search_node.h.

10.55.2.3 typedef _TP coco::work_node::constraint_iterator_base::pointer

These types are needed for an iterator.

Definition at line 846 of file search_node.h.

10.55.2.4 typedef _TR coco::work_node::constraint_iterator_base::reference

These types are needed for an iterator.

Definition at line 845 of file search_node.h.

10.55.2.5 typedef size_t coco::work_node::constraint_iterator_base::size_type

These types are needed for an iterator.

Definition at line 848 of file search_node.h.

10.55.2.6 typedef _TW coco::work_node::constraint_iterator_base::value_type

These types are needed for an iterator.

Definition at line 844 of file search_node.h.

10.55.3 Constructor & Destructor Documentation

10.55.3.1 coco::work_node::constraint_iterator_base::constraint_iterator_base ( ) [inline]

Standard Constructor

Definition at line 854 of file search_node.h.

10.55.3.2 coco::work_node::constraint_iterator_base::constraint_iterator_base (_Reference *cs,* unsigned int *tp*) [inline]

Constructor, which initializes the vector with `cs` and the type with `tp`.

Definition at line 857 of file search_node.h.

10.55.3.3 coco::work_node::constraint_iterator_base::constraint_iterator_base (const _Self & *__c*) [inline]

Standard Copy Constructor

Definition at line 860 of file search_node.h.

10.55.3.4 coco::work_node::constraint_iterator_base::~constraint_iterator_base ( ) [inline]

Standard Destructor

Definition at line 864 of file search_node.h.

10.55.4 Member Function Documentation

10.55.4.1 bool coco::work_node::constraint_iterator_base::operator!= (const _Self & *_c*) [inline]

Disequality Comparison Operator

Definition at line 876 of file search_node.h.

10.55.4.2 reference coco::work_node::constraint_iterator_base::operator* ( ) const [inline]

Dereference Operator

Definition at line 867 of file search_node.h.

10.55.4.3 _Self& coco::work_node::constraint_iterator_base::operator++ ( )

Increment operator: go to the next constraint of the specified type

10.55.4.4 _Self coco::work_node::constraint_iterator_base::operator++ (int)

Increment operator: go to the next constraint of the specified type

10.55.4.5 _Self& coco::work_node::constraint_iterator_base::operator-- ( )

Decrement operator: go to the previous constraint of the specified type

10.55.4.6 _Self coco::work_node::constraint_iterator_base::operator-- (int)

Decrement operator: go to the previous constraint of the specified type

10.55.4.7 pointer coco::work_node::constraint_iterator_base::operator-> ( ) const [inline]

Arrow Operator

Definition at line 869 of file search_node.h.

10.55.4.8 _Self& coco::work_node::constraint_iterator_base::operator= (const _Self & *_c*)

Standard Assignment Operator

10.55.4.9 bool coco::work_node::constraint_iterator_base::operator== (const _Self & *_c*) [inline]

Equality Comparison Operator

Definition at line 872 of file search_node.h.

10.55.4.10 _Self& coco::work_node::constraint_iterator_base::set (const _Iterator & *_c*)

This method sets the constraint_iterator to the first constraint of the specified type, which is not before _c.

The documentation for this class was generated from the following file:

- search_node.h

10.56 coco::control_data Class Reference

10.56.1 Detailed Description

This class is the main vehicle for communicating service information and module parameters to all COCONUT modules. It is a datamap (i.e. a map of strings (parameter names) to basic_alltype values (the parameter values) with the addition of a service identifier.

10.56.2 Constructor & Destructor Documentation

10.56.2.1 coco::control_data::control_data ( ) [inline]

Standard Constructor

Definition at line 55 of file control_data.h.

10.56.2.2 coco::control_data::control_data (const std::string & *__n*, const basic_alltype & *__v*) [inline]

Constructor, which sets the parameter with name __n to value __v.

Definition at line 58 of file control_data.h.

10.56.2.3 coco::control_data::control_data (const char * *__n*, const basic_alltype & *__v*) [inline]

Constructor, which sets the parameter with name __n to value __v.

Definition at line 62 of file control_data.h.

10.56.2.4 coco::control_data::control_data (const control_data & *__c*) [inline]

Constructor, which sets the service to __c.

Definition at line 65 of file control_data.h.

10.56.2.5 coco::control_data::control_data (const std::string & *serv*, const info_contents & *inf*) [inline]

Constructor, which sets the service to serv and initializes the parameter structure from the info_contents inf.

Definition at line 68 of file control_data.h.

10.56.2.6 virtual coco::control_data::~control_data ( ) [inline, virtual]

Standard Destructor

Definition at line 71 of file control_data.h.

10.56.3 Member Function Documentation

10.56.3.1 template<class _TS > void coco::control_data::assign (const std::string & __s, const std::vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 67 of file control_data.hpp.

10.56.3.2 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::sparse_vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 80 of file control_data.hpp.

10.56.3.3 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::dense_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 93 of file control_data.hpp.

10.56.3.4 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::sparse_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 106 of file control_data.hpp.

10.56.3.5 template<class _TS > void coco::control_data::assign (const std::string & __s, _TS & __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly

into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 119 of file control_data.hpp.

10.56.3.6 template<class _TS > void coco::control_data::assign (const char * __s, const std::vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 176 of file control_data.hpp.

10.56.3.7 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::sparse_vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 184 of file control_data.hpp.

10.56.3.8 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::dense_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 192 of file control_data.hpp.

10.56.3.9 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::sparse_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 200 of file control_data.hpp.

10.56.3.10 template<class _TS > void coco::control_data::assign (const char * __s, _TS & __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 208 of file control_data.hpp.

10.56.3.11 void coco::control_data::assign (const std::string & __s, std::string & __b, const char * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 130 of file control_data.hpp.

10.56.3.12 void coco::control_data::assign (const char * __s, std::string & __b, const char * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 214 of file control_data.hpp.

10.56.3.13 template<class _TS > void coco::control_data::assign (const std::string & __s, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 137 of file control_data.hpp.

10.56.3.14 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 145 of file control_data.hpp.

10.56.3.15 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 153 of file control_data.hpp.

10.56.3.16 template<class _TS > void coco::control_data::assign (const std::string & __s, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 161 of file control_data.hpp.

10.56.3.17 template<class _TS > void coco::control_data::assign (const std::string & __s, _TS & __b, _TS __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 169 of file control_data.hpp.

10.56.3.18 template<class _TS > void coco::control_data::assign (const char * __s, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 221 of file control_data.hpp.

10.56.3.19 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 228 of file control_data.hpp.

10.56.3.20 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 236 of file control_data.hpp.

10.56.3.21 template<class _TS > void coco::control_data::assign (const char * __s, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 244 of file control_data.hpp.

10.56.3.22 template<class _TS > void coco::control_data::assign (const char * __s, _TS & __b, _TS __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 252 of file control_data.hpp.

10.56.3.23 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const std::vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 259 of file control_data.hpp.

10.56.3.24 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::sparse_vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 272 of file control_data.hpp.

10.56.3.25 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::dense_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 285 of file control_data.hpp.

10.56.3.26 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::sparse_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 298 of file control_data.hpp.

10.56.3.27 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, _TS & __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 311 of file control_data.hpp.

10.56.3.28 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const std::vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 368 of file control_data.hpp.

10.56.3.29 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::sparse_vector< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 376 of file control_data.hpp.

10.56.3.30 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::dense_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 384 of file control_data.hpp.

10.56.3.31 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::sparse_matrix< _TS > *& __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set

pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 392 of file control_data.hpp.

10.56.3.32 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, _TS & __b) const throw (api_exception) [inline]

These assign methods assign the value of the **required** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the required parameter is not set an api_exception of type apiee_communication_data is thrown.

Definition at line 400 of file control_data.hpp.

10.56.3.33 void coco::control_data::assign_i (const std::string & __s, int i, std::string & __b, const char * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 322 of file control_data.hpp.

10.56.3.34 void coco::control_data::assign_i (const char * __s, int i, std::string & __b, const char * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 406 of file control_data.hpp.

10.56.3.35 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 329 of file control_data.hpp.

10.56.3.36 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 337 of file control_data.hpp.

10.56.3.37 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 345 of file control_data.hpp.

10.56.3.38 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 353 of file control_data.hpp.

10.56.3.39 template<class _TS > void coco::control_data::assign_i (const std::string & __s, int i, _TS & __b, _TS __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 361 of file control_data.hpp.

10.56.3.40 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 413 of file control_data.hpp.

10.56.3.41 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name ___s and index i to the variable ___b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value ___def is assigned to ___b.

Definition at line 421 of file control_data.hpp.

10.56.3.42 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s and index i to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 429 of file control_data.hpp.

10.56.3.43 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s and index i to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 437 of file control_data.hpp.

10.56.3.44 template<class _TS > void coco::control_data::assign_i (const char * __s, int i, _TS & __b, _TS __def) const [inline]

These assign methods assign the value of the **optional** parameter with name __s and index i to the variable __b. Note that scalar variables are assigned but for non-scalar variables rather a pointer is set pointing directly into the control data structure to avoid unnecessary big copy operations. If the optional parameter is not set the default value __def is assigned to __b.

Definition at line 445 of file control_data.hpp.

10.56.3.45 bool coco::control_data::check_service (const std::string & __n) const [inline]

This method checks whether the service is set to __n.

Definition at line 51 of file control_data.hpp.

10.56.3.46 bool coco::control_data::check_service (const char * __n) const [inline]

This method checks whether the service is set to __n.

Definition at line 56 of file control_data.hpp.

10.56.3.47 bool coco::datamap::defd (const std::string & __s) const [inline, inherited]

This method returns whether the variable with name __s is defined.

Definition at line 109 of file datamap.hpp.

10.56.3.48 bool coco::datamap::defd (const char * __s) const [inline, inherited]

This method returns whether the variable with name __s is defined.

Definition at line 114 of file datamap.hpp.

10.56.3.49 bool coco::datamap::defd (const std::string & __s, int i) const [inline, inherited]

This method returns whether the variable with name ___s and index is defined.

Definition at line 119 of file datamap.hpp.

10.56.3.50 bool coco::datamap::defd (const char * __s, int i) const [inline, inherited]

This method returns whether the variable with name ___s and index is defined.

Definition at line 124 of file datamap.hpp.

10.56.3.51 const basic_alltype& coco::control_data::get (const std::string & __s) const [inline]

These methods retrieve the value of the parameter with name ___s.

Definition at line 132 of file control_data.h.

10.56.3.52 const basic_alltype& coco::control_data::get (const char * __cp) const [inline]

These methods retrieve the value of the parameter with name ___s.

Definition at line 134 of file control_data.h.

10.56.3.53 const basic_alltype& coco::control_data::get (const std::string & __s, int i) const [inline]

These methods retrieve the value of the parameter with name ___s and index i.

Definition at line 140 of file control_data.h.

10.56.3.54 const basic_alltype& coco::control_data::get (const char * __cp, int i) const [inline]

These methods retrieve the value of the parameter with name ___s and index i.

Definition at line 142 of file control_data.h.

10.56.3.55 bool coco::control_data::is_set (const std::string & __s) const [inline]

These methods check whether the parameter with name ___s is defined.

Definition at line 170 of file control_data.h.

10.56.3.56 bool coco::control_data::is_set (const char * __cp) const [inline]

These methods check whether the parameter with name ___s is defined.

Definition at line 171 of file control_data.h.

10.56.3.57 bool coco::control_data::is_set (const std::string & __s, int i) const [inline]

These methods check whether the parameter with name ___s and index i is defined.

Definition at line 176 of file control_data.h.

10.56.3.58 bool coco::control_data::is_set (const char * __cp, int i) const [inline]

These methods check whether the parameter with name ___s and index i is defined.

Definition at line 177 of file control_data.h.

10.56.3.59 void coco::control_data::list (std::vector< std::string > & __v) const [inline]

The list method sets ___v to the list of entry keys stored in this control data structure.

Reimplemented from coco::coco::datamap.

Definition at line 61 of file control_data.hpp.

10.56.3.60 control_data& coco::control_data::operator= (const control_data & __c) [inline]

Standard Assignment Operator

Definition at line 74 of file control_data.h.

10.56.3.61 control_data& coco::control_data::operator= (const info_contents & __i) [inline]

Assignment Operator, which assigns the parameter structure from an info_contents structure.

Definition at line 83 of file control_data.h.

10.56.3.62 void coco::datamap::remove (const std::string & __s) [inline, inherited]

The remove methods remove the variable with name ___s from the datamap.

Definition at line 57 of file datamap.hpp.

10.56.3.63 void coco::datamap::remove (const char * __s) [inline, inherited]

The remove methods remove the variable with name ___s from the datamap.

Definition at line 65 of file datamap.hpp.

10.56.3.64 void coco::datamap::remove (const std::string & __s, int i) [inline, inherited]

The remove methods remove the variable with name ___s and index i from the datamap.

Definition at line 70 of file datamap.hpp.

10.56.3.65 void coco::datamap::remove (const char * __s, int i) [inline, inherited]

The remove methods remove the variable with name ___s and index i from the datamap.

Definition at line 76 of file datamap.hpp.

10.56.3.66 bool coco::datamap::retrieve (const std::string & __s, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable ___s to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 149 of file datamap.hpp.

10.56.3.67 bool coco::datamap::retrieve (const std::string & __s, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 169 of file datamap.hpp.

10.56.3.68 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 191 of file datamap.hpp.

10.56.3.69 bool coco::datamap::retrieve (const std::string & __s, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 213 of file datamap.hpp.

10.56.3.70 bool coco::datamap::retrieve (const std::string & __s, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 235 of file datamap.hpp.

10.56.3.71 bool coco::datamap::retrieve (const std::string & __s, std::string & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 257 of file datamap.hpp.

10.56.3.72 bool coco::datamap::retrieve (const std::string & __s, num::Number & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 279 of file datamap.hpp.

10.56.3.73 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 301 of file datamap.hpp.

10.56.3.74 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 323 of file datamap.hpp.

10.56.3.75 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 345 of file datamap.hpp.

10.56.3.76 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 367 of file datamap.hpp.

10.56.3.77 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 389 of file datamap.hpp.

10.56.3.78 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 411 of file datamap.hpp.

10.56.3.79 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 433 of file datamap.hpp.

10.56.3.80 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 455 of file datamap.hpp.

10.56.3.81 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 477 of file datamap.hpp.

10.56.3.82 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 499 of file datamap.hpp.

10.56.3.83 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 521 of file datamap.hpp.

10.56.3.84 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 543 of file datamap.hpp.

10.56.3.85 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 565 of file datamap.hpp.

10.56.3.86 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 587 of file datamap.hpp.

10.56.3.87 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 609 of file datamap.hpp.

10.56.3.88 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 631 of file datamap.hpp.

10.56.3.89 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 653 of file datamap.hpp.

10.56.3.90 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 675 of file datamap.hpp.

10.56.3.91 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 697 of file datamap.hpp.

10.56.3.92 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 719 of file datamap.hpp.

10.56.3.93 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 741 of file datamap.hpp.

10.56.3.94 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 763 of file datamap.hpp.

10.56.3.95 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 785 of file datamap.hpp.

10.56.3.96 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 807 of file datamap.hpp.

10.56.3.97 bool coco::datamap::retrieve (const char * __s, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 829 of file datamap.hpp.

10.56.3.98 bool coco::datamap::retrieve (const char * __s, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 839 of file datamap.hpp.

10.56.3.99 bool coco::datamap::retrieve (const char * __s, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 849 of file datamap.hpp.

10.56.3.100 bool coco::datamap::retrieve (const char * __s, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 859 of file datamap.hpp.

10.56.3.101 bool coco::datamap::retrieve (const char * __s, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 869 of file datamap.hpp.

10.56.3.102 bool coco::datamap::retrieve (const char * __s, std::string & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 879 of file datamap.hpp.

10.56.3.103 bool coco::datamap::retrieve (const char * __s, num::Number & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 889 of file datamap.hpp.

10.56.3.104 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 899 of file datamap.hpp.

10.56.3.105 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 919 of file datamap.hpp.

10.56.3.106 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 909 of file datamap.hpp.

10.56.3.107 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 929 of file datamap.hpp.

10.56.3.108 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 939 of file datamap.hpp.

10.56.3.109 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 949 of file datamap.hpp.

10.56.3.110 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 959 of file datamap.hpp.

10.56.3.111 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 969 of file datamap.hpp.

10.56.3.112 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 989 of file datamap.hpp.

10.56.3.113 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 979 of file datamap.hpp.

10.56.3.114 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 999 of file datamap.hpp.

10.56.3.115 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1009 of file datamap.hpp.

10.56.3.116 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1019 of file datamap.hpp.

10.56.3.117 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1029 of file datamap.hpp.

10.56.3.118 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1039 of file datamap.hpp.

10.56.3.119 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1050 of file datamap.hpp.

10.56.3.120 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1061 of file datamap.hpp.

10.56.3.121 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1072 of file datamap.hpp.

10.56.3.122 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1083 of file datamap.hpp.

10.56.3.123 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1094 of file datamap.hpp.

10.56.3.124 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1105 of file datamap.hpp.

10.56.3.125 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1116 of file datamap.hpp.

10.56.3.126 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1127 of file datamap.hpp.

10.56.3.127 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1138 of file datamap.hpp.

10.56.3.128 bool coco::datamap::retrieve (const std::string & __s, bool & __v, bool __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 159 of file datamap.hpp.

10.56.3.129 bool coco::datamap::retrieve (const std::string & __s, int & __v, int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 181 of file datamap.hpp.

10.56.3.130 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v, unsigned int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 203 of file datamap.hpp.

10.56.3.131 bool coco::datamap::retrieve (const std::string & __s, double & __v, double __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 225 of file datamap.hpp.

10.56.3.132 bool coco::datamap::retrieve (const std::string & __s, interval & __v, const interval & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 247 of file datamap.hpp.

10.56.3.133 bool coco::datamap::retrieve (const std::string & __s, std::string & __is, const std::string & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 269 of file datamap.hpp.

10.56.3.134 bool coco::datamap::retrieve (const std::string & __s, num::Number & __is, const num::Number & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 291 of file datamap.hpp.

10.56.3.135 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 313 of file datamap.hpp.

10.56.3.136 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v, const std::vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 335 of file datamap.hpp.

10.56.3.137 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 357 of file datamap.hpp.

10.56.3.138 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v, const std::vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 379 of file datamap.hpp.

10.56.3.139 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 401 of file datamap.hpp.

10.56.3.140 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 423 of file datamap.hpp.

10.56.3.141 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 445 of file datamap.hpp.

10.56.3.142 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 467 of file datamap.hpp.

10.56.3.143 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 489 of file datamap.hpp.

10.56.3.144 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 511 of file datamap.hpp.

10.56.3.145 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 533 of file datamap.hpp.

10.56.3.146 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 555 of file datamap.hpp.

10.56.3.147 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< std::string > *& __v, const vmtl::sparse_vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 577 of file datamap.hpp.

10.56.3.148 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< num::Number > *& __v, const vmtl::sparse_vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 599 of file datamap.hpp.

10.56.3.149 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 621 of file datamap.hpp.

10.56.3.150 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 643 of file datamap.hpp.

10.56.3.151 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 665 of file datamap.hpp.

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 819 of file datamap.hpp.

10.56.3.159 bool coco::datamap::retrieve (const char * __s, bool & __v, bool __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 834 of file datamap.hpp.

10.56.3.160 bool coco::datamap::retrieve (const char * __s, int & __v, int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 844 of file datamap.hpp.

10.56.3.161 bool coco::datamap::retrieve (const char * __s, unsigned int & __v, unsigned int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 854 of file datamap.hpp.

10.56.3.162 bool coco::datamap::retrieve (const char * __s, double & __v, double __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 864 of file datamap.hpp.

10.56.3.163 bool coco::datamap::retrieve (const char * __s, interval & __v, const interval & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 874 of file datamap.hpp.

10.56.3.164 bool coco::datamap::retrieve (const char * __s, std::string & __v, const std::string & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 884 of file datamap.hpp.

10.56.3.165 bool coco::datamap::retrieve (const char * __s, num::Number & __v, const num::Number & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 894 of file datamap.hpp.

10.56.3.166 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 904 of file datamap.hpp.

10.56.3.167 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 924 of file datamap.hpp.

10.56.3.168 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v, const std::vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 914 of file datamap.hpp.

10.56.3.169 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v, const std::vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 934 of file datamap.hpp.

10.56.3.170 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 944 of file datamap.hpp.

10.56.3.171 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 954 of file datamap.hpp.

10.56.3.172 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 964 of file datamap.hpp.

10.56.3.173 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 974 of file datamap.hpp.

10.56.3.174 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 994 of file datamap.hpp.

10.56.3.175 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 984 of file datamap.hpp.

10.56.3.176 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1004 of file datamap.hpp.

10.56.3.177 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1014 of file datamap.hpp.

10.56.3.178 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v, const vmtl::sparse_vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1024 of file datamap.hpp.

10.56.3.179 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v, const vmtl::sparse_vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1034 of file datamap.hpp.

10.56.3.180 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1044 of file datamap.hpp.

10.56.3.181 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1055 of file datamap.hpp.

10.56.3.182 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1066 of file datamap.hpp.

Definition at line 1750 of file datamap.hpp.

10.56.3.221 bool coco::datamap::retrieve_i (const char * __s, int i, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1770 of file datamap.hpp.

10.56.3.222 bool coco::datamap::retrieve_i (const char * __s, int i, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1780 of file datamap.hpp.

10.56.3.223 bool coco::datamap::retrieve_i (const char * __s, int i, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1790 of file datamap.hpp.

10.56.3.224 bool coco::datamap::retrieve_i (const char * __s, int i, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1800 of file datamap.hpp.

10.56.3.225 bool coco::datamap::retrieve_i (const char * __s, int i, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1810 of file datamap.hpp.

10.56.3.226 bool coco::datamap::retrieve_i (const char * __s, int i, std::string & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1820 of file datamap.hpp.

10.56.3.227 bool coco::datamap::retrieve_i (const char * __s, int i, num::Number & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1830 of file datamap.hpp.

10.56.3.228 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1840 of file datamap.hpp.

10.56.3.229 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1850 of file datamap.hpp.

10.56.3.230 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1860 of file datamap.hpp.

10.56.3.231 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1870 of file datamap.hpp.

10.56.3.232 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1880 of file datamap.hpp.

10.56.3.233 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1890 of file datamap.hpp.

10.56.3.234 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1900 of file datamap.hpp.

10.56.3.235 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1910 of file datamap.hpp.

10.56.3.236 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1920 of file datamap.hpp.

10.56.3.237 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1930 of file datamap.hpp.

10.56.3.238 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1940 of file datamap.hpp.

10.56.3.239 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1950 of file datamap.hpp.

10.56.3.240 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1960 of file datamap.hpp.

10.56.3.241 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1970 of file datamap.hpp.

10.56.3.242 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1980 of file datamap.hpp.

10.56.3.243 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1991 of file datamap.hpp.

10.56.3.244 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2002 of file datamap.hpp.

10.56.3.245 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2013 of file datamap.hpp.

10.56.3.246 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2024 of file datamap.hpp.

10.56.3.247 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2035 of file datamap.hpp.

10.56.3.248 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2084 of file datamap.hpp.

10.56.3.314 void coco::control_data::service (const std::string & __s) [inline]

This method sets the service to __s.

Definition at line 35 of file control_data.hpp.

10.56.3.315 void coco::control_data::service (const char * __s) [inline]

This method sets the service to __s.

Definition at line 37 of file control_data.hpp.

10.56.3.316 const std::string & coco::control_data::service ( ) const throw (api_exception) [inline]

This method returns the service. If no service is defined, an api_exception of type apiee_communication_-data is thrown.

Definition at line 42 of file control_data.hpp.

10.56.3.317 void coco::control_data::set (const info_contents & __i) [inline]

This method sets all parameters which are set in the info_contents structure __i to the values specified there.

Definition at line 104 of file control_data.h.

10.56.3.318 void coco::control_data::set (const std::string & __s, const basic_alltype & __h) [inline]

These methods set the parameter with name __s to value __h. Note that the constructors of the basic_-alltype class make it possible to use the set methods for every "subtype" of the basic_alltype class without explicitly using a basic_alltype constructor

Definition at line 112 of file control_data.h.

10.56.3.319 void coco::control_data::set (const char * __cp, const basic_alltype & __h) [inline]

These methods set the parameter with name ___s to value ___h. Note that the constructors of the basic_alltype class make it possible to use the set methods for every "subtype" of the basic_alltype class without explicitly using a basic_alltype constructor

Definition at line 114 of file control_data.h.

10.56.3.320 void coco::control_data::set (const std::string & __s, int i, const basic_alltype & __h) [inline]

These methods set the parameter with name ___s and index i to value ___h. Note that the constructors of the basic_alltype class * make it possible to use the set methods for every "subtype" of the basic_alltype class without explicitly using a basic_alltype constructor

Definition at line 123 of file control_data.h.

10.56.3.321 void coco::control_data::set (const char * __cp, int i, const basic_alltype & __h) [inline]

These methods set the parameter with name ___s and index i to value ___h. Note that the constructors of the basic_alltype class * make it possible to use the set methods for every "subtype" of the basic_alltype class without explicitly using a basic_alltype constructor

Definition at line 125 of file control_data.h.

10.56.3.322 const basic_alltype & coco::datamap::sfind (const std::string & __s) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable ___s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 81 of file datamap.hpp.

10.56.3.323 const basic_alltype & coco::datamap::sfind (const char * __s) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable ___s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 90 of file datamap.hpp.

10.56.3.324 const basic_alltype & coco::datamap::sfind (const std::string & __s, int i) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable ___s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 95 of file datamap.hpp.

10.56.3.325 const basic_alltype & coco::datamap::sfind (const char * __s, int i) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable ___s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 104 of file datamap.hpp.

10.56.3.326 bool coco::datamap::sinsert (const std::string & __s, const basic_alltype & __h, bool replace) [inherited]

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.cc.

10.56.3.327 bool coco::datamap::sinsert (const char * __s, const basic_alltype & __h, bool replace) [inline, inherited]

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.hpp.

10.56.3.328 bool coco::datamap::sinsert (const std::string & __s, int i, const basic_alltype & __h, bool replace) [inline, inherited]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 42 of file datamap.hpp.

10.56.3.329 bool coco::datamap::sinsert (const char * __s, int i, const basic_alltype & __h, bool replace) [inline, inherited]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 50 of file datamap.hpp.

10.56.3.330 void coco::control_data::unset (const std::string & __s) [inline]

These unset methods remove the parameter with name __s from the control data.

Definition at line 150 of file control_data.h.

10.56.3.331 void coco::control_data::unset (const char * __cp) [inline]

These unset methods remove the parameter with name __s from the control data.

Definition at line 151 of file control_data.h.

10.56.3.332 void coco::control_data::unset (const std::string & __s, int i) [inline]

These unset methods remove the parameter with name __s and index i from the control data.

Definition at line 156 of file control_data.h.

10.56.3.333 void coco::control_data::unset (const char * __cp, int i) [inline]

These unset methods remove the parameter with name __s and index i from the control data.

Definition at line 157 of file control_data.h.

10.56.3.334 bool coco::datamap::which (const std::string & __s, std::vector< int > & __idx) const [inline, inherited]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 129 of file datamap.hpp.

10.56.3.335 bool coco::datamap::which (const char * __s, std::vector< int > & __idx) const [inline, inherited]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 143 of file datamap.hpp.

10.56.3.336 bool coco::control_data::which_set (const std::string & __s, std::vector< int > & __idx) const [inline]

These methods set the vector __idx to all indices which are defined for the parameter with name __s.

Definition at line 183 of file control_data.h.

10.56.3.337 bool coco::control_data::which_set (const char * __cp, std::vector< int > & __idx) const [inline]

These methods set the vector __idx to all indices which are defined for the parameter with name __s.

Definition at line 185 of file control_data.h.

  C++ stream output operator for convex_e.

10.57.1 Detailed Description

This class stores the convexity information of a node. It is part of the semantics structure.

10.57.2 Constructor & Destructor Documentation

10.57.2.1 coco::convex_e::convex_e ( ) [inline]

Standard Constructor

Definition at line 70 of file convex_info.h.

10.57.2.2 coco::convex_e::convex_e (const convex_info & __e, uint16_t __t) [inline]

Constructor, which initializes the convex_info with __e and the algorithm complexity with __t.

Definition at line 73 of file convex_info.h.

10.57.2.3 coco::convex_e::convex_e (const convex_e & __e) [inline]

Standard Copy Constructor

Definition at line 75 of file convex_info.h.

10.57.2.4 coco::convex_e::convex_e (int16_t __e) [inline, explicit]

Constructor, which initializes the convex_info with the equivalent integer ___e and sets the algorithm complexity to 0.

Definition at line 78 of file convex_info.h.

10.57.2.5 coco::convex_e::~convex_e ( ) [inline]

Standard Destructor

Definition at line 81 of file convex_info.h.

10.57.3 Member Function Documentation

10.57.3.1 const convex_info& coco::convex_e::i ( ) const [inline]

This method returns the convex_info stored.

Definition at line 84 of file convex_info.h.

10.57.3.2 void coco::convex_e::merge (const convex_e & __c) [inline]

This method merges a convex_e with another convex_e ___c.

Definition at line 136 of file convex_info.h.

10.57.3.3 convex_e coco::convex_e::operator- ( ) const [inline]

The unary minus operator changes a convex_e in the same way as the convexity structure of f changes for the transition $f \to -f$.

Definition at line 91 of file convex_info.h.

10.57.3.4 convex_e& coco::convex_e::operator= (const convex_e & __c) [inline]

Standard Assignment Operator

Definition at line 104 of file convex_info.h.

10.57.3.5 convex_e& coco::convex_e::operator= (const convex_info & __i) [inline]

Assignment Operator, which only assigns the convex_info part.

Definition at line 112 of file convex_info.h.

10.57.3.6 convex_e& coco::convex_e::operator= (unsigned int __t) [inline]

Assignment Operator, which only assigns the algorithm complexity part.

Definition at line 119 of file convex_info.h.

10.57.3.7 convex_e& coco::convex_e::operator= (uint16_t __t) [inline]

Assignment Operator, which only assigns the algorithm complexity part.

Definition at line 126 of file convex_info.h.

10.57.3.8 void coco::convex_e::read (char * c)

This method reads a convex_e from the string c in .dag encoding.

10.57.3.9 uint16_t coco::convex_e::t ( ) const [inline]

This method returns the algorithm complexity stored.

Definition at line 86 of file convex_info.h.

10.57.4 Friends And Related Function Documentation

10.57.4.1 bool operator!= (const convex_e & __c, const convex_e & __d) [friend]

Disequality comparison operator. Note that only the convex_info part counts!

Definition at line 195 of file convex_info.h.

10.57.4.2 bool operator!= (const convex_e & __c, const convex_info & __d) [friend]

Disequality comparison operator with a convex_info.

Definition at line 203 of file convex_info.h.

10.57.4.3 bool operator!= (const convex_info & __c, const convex_e & __d) [friend]

Disequality comparison operator with a convex_info.

Definition at line 211 of file convex_info.h.

10.57.4.4 std::ostream& operator<< (std::ostream & o, const convex_e & __s) [friend]

This operator writes a convex_e in .dag format to an ostream.

Definition at line 219 of file convex_info.h.

10.57.4.5 bool operator== (const convex_e & __c, const convex_e & __d) [friend]

Equality comparison operator. Note that only the convex_info part counts!

Definition at line 171 of file convex_info.h.

10.57.4.6 bool operator== (const convex_e & __c, const convex_info & __d) [friend]

Equality comparison operator with a convex_info.

Definition at line 179 of file convex_info.h.

10.57.4.7 bool operator== (const convex_info & __c, const convex_e & __d) [friend]

Equality comparison operator with a convex_info.

Definition at line 187 of file convex_info.h.

- bool is_empty () const

10.59.1 Detailed Description

This class provides a simple reference counted pointer. The implementation is non-intrusive; it allocates an additional int and pointer for every counted object.

10.59.2 Member Typedef Documentation

10.59.2.1 typedef _Tp counted_ptr::element_type

The element type of the counted pointer

Definition at line 63 of file counted_ptr.h.

10.59.3 Constructor & Destructor Documentation

10.59.3.1 counted_ptr::counted_ptr (_Tp * *p* = `0`) [inline, explicit]

The constructor allocates a new counter object, at least if `is` non-NULL.

Definition at line 68 of file counted_ptr.h.

10.59.3.2 counted_ptr::~counted_ptr ( ) [inline]

The Standard Destructor just deletes this reference to the counted object.

Definition at line 72 of file counted_ptr.h.

10.59.3.3 counted_ptr::counted_ptr (const counted_ptr & *r*) throw () [inline]

The Copy Constructor gets a new reference to the counted object.

Definition at line 75 of file counted_ptr.h.

10.59.3.4 template<typename _Tq > counted_ptr::counted_ptr (const counted_ptr< _Tq > & *r*) throw () [inline]

The constructor allocates a new counter object.

Definition at line 105 of file counted_ptr.h.

10.59.4 Member Function Documentation

10.59.4.1 _Tp* counted_ptr::get ( ) const throw () [inline]

This is a safeguarded pointer operator

Definition at line 155 of file counted_ptr.h.

10.59.4.2 bool counted_ptr::is_empty ( ) const [inline]

Definition at line 160 of file counted_ptr.h.

10.59.4.3 bool counted_ptr::is_unique ( ) const throw () [inline]

This checks whether the object has only this (unique) reference.

Definition at line 158 of file counted_ptr.h.

10.59.4.4 bool counted_ptr::operator!= (const counted_ptr< _Tp > & *a*) const [inline]

The comparison operator checks whether the pointer to the objects coincide.

Definition at line 134 of file counted_ptr.h.

10.59.4.5 _Tp& counted_ptr::operator* ( ) const throw () [inline]

This is the dereferentiation operator

Definition at line 149 of file counted_ptr.h.

10.59.4.6 _Tp* counted_ptr::operator-> ( ) const throw () [inline]

This is the pointer operator

Definition at line 152 of file counted_ptr.h.

10.59.4.7 counted_ptr& counted_ptr::operator= (const counted_ptr & *r*) [inline]

The Assignment Operator first deletes the reference for the object this counted_ptr points at and then gets a new reference for the assigned object.

Definition at line 81 of file counted_ptr.h.

10.59.4.8 counted_ptr& counted_ptr::operator= (element_type * r) [inline]

This Assignment Operator explicitly sets a new element_type pointer.

Definition at line 92 of file counted_ptr.h.

10.59.4.9 template<typename _Tq > counted_ptr& counted_ptr::operator= (const counted_ptr< _Tq > & r) [inline]

The Assignment Operator first deletes the reference for the object this counted_ptr points at and then gets a new reference for the assigned object.

Definition at line 112 of file counted_ptr.h.

10.59.4.10 bool counted_ptr::operator== (const counted_ptr< _Tp > & a) const [inline]

The comparison operator checks whether the pointer to the objects coincide.

Definition at line 124 of file counted_ptr.h.

10.61.1 Detailed Description

The d1func class is the base class for one dimensional functions. It implements methods for range enclosure of function values, first and second derivatives. Furthermore, backward propagation using an interval - Newton method is included.

10.61.2 Member Typedef Documentation

10.61.2.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.61.2.2 typedef std::vector<point_info> coco::d1func::point_list

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.61.3 Member Enumeration Documentation

10.61.3.1 enum coco::d1func::d1func_point_t

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point-: At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup

d1fp_oddpoledn

d1fp_jumpldef

d1fp_jumpludef

d1fp_point

d1fp_undefined

d1fp_wild

d1fp_jumprdef

d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.61.3.2 enum coco::d1func::d1solve_t

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0

d1solve_1

d1solve_2

Definition at line 106 of file d1func.h.

10.61.5 Member Function Documentation

10.61.5.1 virtual uint64_t coco::d1func::chash ( ) [pure virtual]

the const hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.61.5.2 convex_info coco::d1func::convexity (const interval & i, unsigned int k) const [virtual]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.61.5.3 virtual std::string coco::d1func::dag_out ( ) const [inline, virtual]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 205 of file d1func.h.

10.61.5.4 virtual int coco::d1func::degree_update (int *in_degree*) const [inline, virtual]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.61.5.5 int coco::d1func::differentiability (const interval & *x*, unsigned int *k*) const [virtual]

return differentiability information on `i`.

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 2351 of file d1func.cc.

10.61.5.6 virtual double coco::d1func::eval (double *x*, unsigned int *k*) const [pure virtual]

the point evaluation

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.61.5.7 diffNumber coco::d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual]

the diffNumber evaluation

Reimplemented in coco::dag_d1func.

Definition at line 349 of file d1func.cc.

10.61.5.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.61.5.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual]

the range evaluation

Definition at line 390 of file d1func.cc.

10.61.5.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.61.5.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.61.5.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.61.5.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual]

the range evaluation

Definition at line 794 of file d1func.cc.

10.61.5.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual]

the interval first order slope evaluation at center z

Definition at line 1403 of file d1func.cc.

10.61.5.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual]

the interval second order slope evaluation at centers z and y

Definition at line 1984 of file d1func.cc.

10.61.5.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.61.5.17 virtual std::pair<double,double> coco::d1func::evald (double *x*, unsigned int *k*) const [inline, virtual]

the point and derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 437 of file d1func.h.

10.61.5.18 virtual void coco::d1func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual]

the point, first to third derivative evaluation

Reimplemented in coco::xexp_func.

Definition at line 443 of file d1func.h.

10.61.5.19 virtual std::triple<double,double,double> coco::d1func::evalt (double *x*, unsigned int *k*) const [inline, virtual]

the point and first and second derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 440 of file d1func.h.

10.61.5.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.61.5.21 virtual const char* coco::d1func::func_name ( ) const [pure virtual]

the name of the d1func.

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.61.5.22 virtual interval coco::d1func::imperfect_eval (const interval & *x*, unsigned int *k*) const [pure virtual]

the imperfect evaluation of k th derivative.

Implemented in coco::xexp_func, coco::hsf_func, and coco::dag_d1func.

10.61.5.23 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.61.5.24 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual]

back propagation

Definition at line 1708 of file d1func.cc.

10.61.5.25 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual]

back propagation

Definition at line 1778 of file d1func.cc.

10.61.5.26 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.61.5.27 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual]

the other comparison operator

Definition at line 476 of file d1func.h.

10.61.5.28 virtual bool coco::d1func::operator== (const d1func & *b*) const [inline, virtual]

the comparison operator

Reimplemented in coco::hsf_func, coco::xexp_func, and coco::dag_d1func.

Definition at line 473 of file d1func.h.

10.61.5.29 virtual bool coco::d1func::order_is_supported (unsigned int *k*) const [inline, virtual]

check whether evaluation of this order is supported.

Definition at line 460 of file d1func.h.

10.61.5.30 virtual std::ostream& coco::d1func::print_add (std::ostream & *o*) const [inline, virtual]

additional info written in DAG format (it must contain dag lines)

Reimplemented in coco::dag_d1func.

Definition at line 208 of file d1func.h.

10.61.5.31 virtual std::string coco::d1func::print_params ( ) const [inline, virtual]

the parameters written in printable form

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 211 of file d1func.h.

10.61.5.32 virtual void coco::d1func::raise_order (unsigned int *neworder*) [inline, protected, virtual]

raise the order of the supported function evaluation to `neworder`

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 215 of file d1func.h.

10.61.5.33 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.61.5.34 virtual uint64_t coco::d1func::thash ( ) [pure virtual]

the pure hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.61.5.35 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const

Definition at line 2415 of file d1func.cc.

10.61.6 Member Data Documentation

10.61.6.1 std::vector<func_info> coco::d1func::_f [protected]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.61.6.2 int coco::d1func::basic_diff [protected]

basic differentiability

Definition at line 160 of file d1func.h.

10.61.6.3 double coco::d1func::dod_left [protected]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.61.6.4 double coco::d1func::dod_right [protected]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.61.6.5 volatile int coco::d1func::MAXLEN

maximal lenght of the interval set returned

Definition at line 167 of file d1func.h.

The documentation for this class was generated from the following files:

- d1func.h
- d1func.cc

10.62.1 Detailed Description

The d1func_expr class is the class for one dimensional function expressions. It wraps the d1func class with an additional parameter for the order of the derivative.

10.62.2 Constructor & Destructor Documentation

10.62.2.1 coco::d1func_expr::d1func_expr (d1func * _d, unsigned int _k = 0) [inline]

constructor: note the _d should be allocated with new!

Definition at line 73 of file d1func_expr.h.

10.62.2.2 coco::d1func_expr::~d1func_expr ( ) [inline]

the destructor

Definition at line 76 of file d1func_expr.h.

10.62.3 Member Function Documentation

10.62.3.1 convex_e coco::d1func_expr::convex_update (const convex_e & c, const interval & i) const

update the convexity information for in argument convexity `c` on interval `i`.

Definition at line 35 of file d1func_expr.cc.

10.62.3.2 std::string coco::d1func_expr::dag_out ( ) const [inline]

the parameters written in DAG format (it must contain necessary ':'s)

Definition at line 63 of file d1func_expr.h.

10.62.3.3 int coco::d1func_expr::degree_update (int in_degree) const [inline]

update the degree for in-argument degree `in_degree`.

Definition at line 143 of file d1func_expr.h.

10.62.3.4 int coco::d1func_expr::differentiability (int diff, const interval & i) const

return differentiability information on `i`.

Definition at line 88 of file d1func_expr.cc.

10.62.3.5 d1func_expr* coco::d1func_expr::differentiate (unsigned int order) const [inline]

differentiate a d1func_expr

Definition at line 154 of file d1func_expr.h.

10.62.3.6 double coco::d1func_expr::eval (double x, unsigned int order = 0) const [inline]

the point evaluation

Definition at line 80 of file d1func_expr.h.

10.62.3.7 diffNumber coco::d1func_expr::eval (const diffNumber & *x*, unsigned int *order* = 0) const [inline]

the differential number evaluation

Definition at line 92 of file d1func_expr.h.

10.62.3.8 hessNumber coco::d1func_expr::eval (const hessNumber & *x*, unsigned int *order* = 0) const [inline]

the Hessian number evaluation

Definition at line 95 of file d1func_expr.h.

10.62.3.9 interval coco::d1func_expr::eval (const interval & *x*, unsigned int *order* = 0) const [inline]

the range evaluation

Definition at line 98 of file d1func_expr.h.

10.62.3.10 interval_set coco::d1func_expr::eval (const interval_set & *x*, unsigned int *order* = 0) const [inline]

the range evaluation

Definition at line 101 of file d1func_expr.h.

10.62.3.11 diffI coco::d1func_expr::eval (const diffI & *x*, unsigned int *order* = 0) const [inline]

the interval differential number evaluation

Definition at line 115 of file d1func_expr.h.

10.62.3.12 ihessNumber coco::d1func_expr::eval (const ihessNumber & *x*, unsigned int *order* = 0) const [inline]

the interval Hessian number evaluation

Definition at line 118 of file d1func_expr.h.

10.62.3.13 Islope coco::d1func_expr::eval (const Islope & *x*, unsigned int *order* = 0) const [inline]

the interval slope evaluation

Definition at line 121 of file d1func_expr.h.

10.62.3.14 interval coco::d1func_expr::eval_slp (const interval & *z*, const interval & *x*, unsigned int *order* = 0) const [inline]

the interval first order slope evaluation at center `z`

Definition at line 104 of file d1func_expr.h.

10.62.3.15 interval coco::d1func_expr::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *order* = 0) const [inline]

the interval second order slope evaluation at centers z and y

Definition at line 107 of file d1func_expr.h.

10.62.3.16 interval coco::d1func_expr::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *order* = 0) const [inline]

the interval second order slope evaluation at double center z

Definition at line 111 of file d1func_expr.h.

10.62.3.17 std::pair<double,double> coco::d1func_expr::evald (double *x*, unsigned int *order* = 0) const [inline]

the point and first derivative evaluation

Definition at line 83 of file d1func_expr.h.

10.62.3.18 void coco::d1func_expr::evalf (double *x*, double * *r*, unsigned int *order* = 0) const [inline]

the point, and first to third derivative evaluation

Definition at line 89 of file d1func_expr.h.

10.62.3.19 std::triple<double,double,double> coco::d1func_expr::evalt (double *x*, unsigned int *order* = 0) const [inline]

the point, first and second derivative evaluation

Definition at line 86 of file d1func_expr.h.

10.62.3.20 std::string coco::d1func_expr::func_name ( ) const [inline]

the name of the d1func.

Definition at line 57 of file d1func_expr.h.

10.62.3.21 unsigned int coco::d1func_expr::get_order ( ) const [inline]

the order of the derivative of the d1func.

Definition at line 60 of file d1func_expr.h.

10.62.3.22 void coco::d1func_expr::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func::d1func_point_t > & *ptin*, std::vector< d1func::d1func_point_t > & *ptres*, unsigned int *order* = 0) const [inline]

Definition at line 124 of file d1func_expr.h.

10.62.3.23 interval_set coco::d1func_expr::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *order* = 0) const [inline]

back propagation

Definition at line 130 of file d1func_expr.h.

10.62.3.24 interval_set coco::d1func_expr::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *order* = 0) const [inline]

back propagation

Definition at line 134 of file d1func_expr.h.

10.62.3.25 bool coco::d1func_expr::operator!= (const d1func_expr & *b*) const [inline]

the other comparison operator

Definition at line 150 of file d1func_expr.h.

10.62.3.26 bool coco::d1func_expr::operator== (const d1func_expr & *b*) const [inline]

the comparison operator

Definition at line 146 of file d1func_expr.h.

10.62.3.27 std::ostream& coco::d1func_expr::print_add (std::ostream & *o*) const [inline]

additional info written in DAG format (it must contain dag lines)

Definition at line 66 of file d1func_expr.h.

10.62.3.28 std::string coco::d1func_expr::print_params ( ) const [inline]

the parameters written in printable form

Definition at line 69 of file d1func_expr.h.

10.62.3.29 unsigned int coco::d1func_expr::supported_eval_order ( ) const [inline]

the maximal order of derivatives which can be evaluated.

Definition at line 139 of file d1func_expr.h.

The documentation for this class was generated from the following files:

- d1func_expr.h
- d1func_expr.cc

10.65.1 Detailed Description

dag_d1func is a one dimensional function defined by a DAG.

10.65.2 Member Typedef Documentation

10.65.2.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info [inherited]

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.65.2.2 typedef std::vector<point_info> coco::d1func::point_list [inherited]

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.65.3 Member Enumeration Documentation

10.65.3.1 enum coco::d1func::d1func_point_t [inherited]

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point- : At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup
d1fp_oddpoledn
d1fp_jumpldef
d1fp_jumpludef
d1fp_point
d1fp_undefined
d1fp_wild
d1fp_jumprdef
d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.65.3.2 enum coco::d1func::d1solve_t [inherited]

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0
d1solve_1
d1solve_2

Definition at line 106 of file d1func.h.

10.65.4 Constructor & Destructor Documentation

10.65.4.1 coco::dag_d1func::~dag_d1func ( ) [virtual]

standard destructor

Definition at line 79 of file dagd1func.cc.

10.65.4.2 coco::dag_d1func::dag_d1func (model * *m*, const interval & *borders*, int *PREPORDER* = -1) [inline]

this constructs a new dag_d1func from a model.

Definition at line 154 of file dagd1func.h.

10.65.4.3 coco::dag_d1func::dag_d1func (const char * *name*, const interval & *borders*, int *PREPORDER* = -1) [inline]

this constructs a new dag_d1func from a file.

Definition at line 163 of file dagd1func.h.

10.65.5 Member Function Documentation

10.65.5.1 virtual uint64_t coco::dag_d1func::chash ( ) [inline, virtual]

the const hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 61 of file dagd1func.h.

10.65.5.2 convex_info coco::d1func::convexity (const interval & *i*, unsigned int *k*) const [virtual, inherited]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.65.5.3 std::string coco::dag_d1func::dag_out ( ) const [virtual]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented from coco::d1func.

Definition at line 104 of file dagd1func.cc.

10.65.5.4 virtual int coco::d1func::degree_update (int *in_degree*) const [inline, virtual, inherited]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.65.5.5 int coco::d1func::differentiability (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return differentiability information on `i`.

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 2351 of file d1func.cc.

10.65.5.6 double coco::dag_d1func::eval (double *x*, unsigned int *k*) const [virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 108 of file dagd1func.cc.

10.65.5.7 diffNumber coco::dag_d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual]

the diffNumber evaluation

Reimplemented from coco::d1func.

Definition at line 138 of file dagd1func.cc.

10.65.5.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.65.5.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 390 of file d1func.cc.

10.65.5.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual, inherited]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.65.5.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.65.5.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual, inherited]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.65.5.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 794 of file d1func.cc.

10.65.5.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval first order slope evaluation at center `z`

Definition at line 1403 of file d1func.cc.

10.65.5.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at centers `z` and `y`

Definition at line 1984 of file d1func.cc.

10.65.5.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.65.5.17 std::pair< double, double > coco::dag_d1func::evald (double *x*, unsigned int *k*) const [virtual]

the point and derivative evaluation

Reimplemented from coco::d1func.

Definition at line 168 of file dagd1func.cc.

10.65.5.18 virtual void coco::d1func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual, inherited]

the point, first to third derivative evaluation

Reimplemented in coco::xexp_func.

Definition at line 443 of file d1func.h.

10.65.5.19 std::triple< double, double, double > coco::dag_d1func::evalt (double *x*, unsigned int *k*) const [virtual]

the point and derivative evaluation

Reimplemented from coco::d1func.

Definition at line 186 of file dagd1func.cc.

10.65.5.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual, inherited]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.65.5.21 virtual const char* coco::dag_d1func::func_name ( ) const [inline, virtual]

the name of the d1func.

Implements coco::d1func.

Definition at line 64 of file dagd1func.h.

10.65.5.22 interval coco::dag_d1func::imperfect_eval (const interval & *x*, unsigned int *k*) const [virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 245 of file dagd1func.cc.

10.65.5.23 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual, inherited]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.65.5.24 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1708 of file d1func.cc.

10.65.5.25 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1778 of file d1func.cc.

10.65.5.26 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.65.5.27 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual, inherited]

the other comparison operator

Definition at line 476 of file d1func.h.

10.65.5.28 virtual bool coco::dag_d1func::operator== (const d1func & *b*) const [inline, virtual]

the comparison operator

Reimplemented from coco::d1func.

Definition at line 91 of file dagd1func.h.

10.65.5.29 virtual std::ostream& coco::dag_d1func::print_add (std::ostream & *o*) const [inline, virtual]

additional info written in DAG format (it must contain dag lines)

Reimplemented from coco::d1func.

Definition at line 70 of file dagd1func.h.

10.65.5.30 virtual std::string coco::dag_d1func::print_params ( ) const [inline, virtual]

the parameters written in printable form

Reimplemented from coco::d1func.

Definition at line 74 of file dagd1func.h.

10.65.5.31 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual, inherited]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.65.5.32 virtual uint64_t coco::dag_d1func::thash ( ) [inline, virtual]

the pure hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 58 of file dagd1func.h.

10.65.5.33 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const [inherited]

Definition at line 2415 of file d1func.cc.

10.65.6 Member Data Documentation

10.65.6.1 std::vector<func_info> coco::d1func::_f [protected, inherited]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.65.6.2 int coco::d1func::basic_diff [protected, inherited]

basic differentiability

Definition at line 160 of file d1func.h.

10.65.6.3 double coco::d1func::dod_left [protected, inherited]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.65.6.4 double coco::d1func::dod_right [protected, inherited]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.65.6.5 volatile int coco::d1func::MAXLEN [inherited]

maximal lenght of the interval set returned

Definition at line 167 of file d1func.h.

The documentation for this class was generated from the following files:

- dagd1func.h
- dagd1func.cc
- dagd1func_bp.cc

10.66 coco::dag_delta Class Reference

The DAG delta class for performing changes to the DAG of a model.

`#include <dag_delta.h>`

10.66.1 Detailed Description

This class is used to specify information for changes to the DAG of a model.

10.66.2 Constructor & Destructor Documentation

10.66.2.1 coco::dag_delta::dag_delta (const std::string & __a, bool full = false) [inline]

Constructor setting the action identifier to __a and the is_full_delta member to full.

Definition at line 190 of file dag_delta.h.

10.66.2.2 coco::dag_delta::dag_delta (const std::string & __a, model * __nc, bool full = false) [inline]

Constructor setting the action identifier to __a and the is_full_delta member to full. Furthermore, the new_constraints member is initialized with __nc.

Definition at line 198 of file dag_delta.h.

10.66.2.3 coco::dag_delta::dag_delta (const dag_delta & __d) [inline]

Standard Copy Constructor

Definition at line 205 of file dag_delta.h.

10.66.2.4 coco::dag_delta::~dag_delta ( ) [inline]

Standard Destructor

Definition at line 216 of file dag_delta.h.

10.66.3 Member Function Documentation

10.66.3.1 void coco::dag_delta::add_new (model * __m) [inline]

This method initializes the new_constraints member.

Definition at line 233 of file dag_delta.h.

10.66.3.2 void coco::dag_delta::add_new (model & __m) [inline]

This method initializes the new_constraints member.

Definition at line 238 of file dag_delta.h.

10.66.3.3 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.66.3.4 bool coco::dag_delta::apply (work_node & x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const

Apply the delta with delta_id _d to work node _x, hereby changing the bounds as requested. save node numbers corresponding to the various new things

Definition at line 112 of file dag_delta.cc.

10.66.3.5 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.66.3.6 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.66.3.7 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.66.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.66.3.9 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.66.3.10 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.66.3.11 void coco::dag_delta::destroy_copy (delta_base * __d) const [inline]

Clone Destructor

Definition at line 230 of file dag_delta.h.

10.66.3.12 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.66.3.13 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.66.3.14 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.66.3.15 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.66.3.16 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.66.3.17 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.66.3.18 dag_delta* coco::dag_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Definition at line 228 of file dag_delta.h.

10.66.3.19 bool coco::dag_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 311 of file dag_delta.h.

10.66.3.20 bool coco::dag_delta::operator!= (const dag_delta & *_c*) const [inline]

Definition at line 318 of file dag_delta.h.

10.66.3.21 bool coco::dag_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Definition at line 308 of file dag_delta.h.

10.66.3.22 bool coco::dag_delta::operator== (const dag_delta & _c) const [inline]

Comparison operators

Definition at line 316 of file dag_delta.h.

10.66.3.23 void coco::dag_delta::remove (const walker & _nn) [inline]

This method adds another node _nn to be removed.

Definition at line 244 of file dag_delta.h.

10.66.3.24 void coco::dag_delta::remove (const std::vector< walker > & _nn) [inline]

This method adds the nodes _nn to the vector of nodes which are to be removed.

Definition at line 247 of file dag_delta.h.

10.66.3.25 void coco::dag_delta::unkeep ( ) [inline, virtual]

Free this delta from the responsibility to remove the nodes from the memory upon destruction of the delta.

Reimplemented from coco::coco::delta_base.

Definition at line 252 of file dag_delta.h.

10.66.4 Friends And Related Function Documentation

10.66.4.1 friend class dag_undelta [friend]

Definition at line 321 of file dag_delta.h.

10.66.5 Member Data Documentation

10.66.5.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

10.66.5.2 bool coco::dag_delta::is_full_delta

If this variable is true, the new_constraints member contains a full model, which is used to replace the model of the work_node when the delta is applied.

Definition at line 186 of file dag_delta.h.

10.66.5.3 counted_ptr<model> coco::dag_delta::new_constraints

This DAG will be added to the DAG of the work node when applied. The ghost nodes in this DAG are used to overlay the nodes with the same node number in the original DAG.

Definition at line 175 of file dag_delta.h.

10.66.5.4 std::vector<walker> coco::dag_delta::rm_nodes

This variable holds the nodes which are to be removed from the work node DAG. Actually, the minimal subgraph generated by the nodes is removed, i.e. the subgraph containing all nodes in rm_nodes and all nodes, which are only connected to them.

Definition at line 181 of file dag_delta.h.

The documentation for this class was generated from the following files:

- dag_delta.h
- dag_delta.cc

10.67 coco::dag_undelta Class Reference

The DAG undelta class for undoing changes to the DAG of a model.

`#include <dag_delta.h>`

10.67.1 Detailed Description

This class is used to specify undo information for changes to the DAG of a model. This class undoes the apply of a dag_delta.

10.67.2 Constructor & Destructor Documentation

10.67.2.1 coco::dag_undelta::dag_undelta (bool *full* = `false`) `[inline]`

Standard Constructor, setting the is_full_undelta member to `full`.

Definition at line 103 of file dag_delta.h.

10.67.2.2 coco::dag_undelta::dag_undelta (gptr< model > * *__nc*) `[inline]`

Constructor, setting the is_full_undelta member to `true` and storing the original model `__nc`.

Definition at line 114 of file dag_delta.h.

10.67.2.3 coco::dag_undelta::dag_undelta (const dag_undelta & *_du*) `[inline]`

Standard Copy Constructor

Definition at line 124 of file dag_delta.h.

10.67.2.4 coco::dag_undelta::~dag_undelta ( ) `[inline]`

Standard Destructor

Definition at line 141 of file dag_delta.h.

10.67.3 Member Function Documentation

10.67.3.1 void coco::dag_undelta::destroy_copy (undelta_base * *__d*) const `[inline]`

Clone Destructor

Definition at line 152 of file dag_delta.h.

10.67.3.2 undelta coco::coco::undelta_base::make_undelta (size_t *s*) `[inline, inherited]`

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.67.3.3 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.67.3.4 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.67.3.5 dag_undelta* coco::dag_undelta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::undelta_base.

Definition at line 150 of file dag_delta.h.

10.67.3.6 bool coco::dag_undelta::unapply (work_node & *x*, const delta_id & *did*) const [virtual]

Undo the dag_delta with delta_id _i in work node _x

Reimplemented from coco::coco::undelta_base.

Definition at line 342 of file dag_delta.cc.

10.67.3.7 virtual bool coco::coco::undelta_base::unapply3 (work_node & *x*, const work_node & *y*, const delta_id & *d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.67.3.8 virtual bool coco::coco::undelta_base::unapply3 (work_node & *x*, const work_node & *y*, const delta_id & *d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.67.3.9 bool coco::coco::undelta_base::unapply3 (work_node & *x*, const work_node & *y*, const delta_id & *d*) const [inline, virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

Definition at line 94 of file api_delta.h.

10.67.4 Friends And Related Function Documentation

10.67.4.1 friend class dag_delta [friend]

Definition at line 157 of file dag_delta.h.

10.67.5 Member Data Documentation

10.67.5.1 std::vector<walker> coco::dag_undelta::added_constraints

The vector of constraints added by the dag_delta

Definition at line 64 of file dag_delta.h.

10.67.5.2 std::vector<walker> coco::dag_undelta::added_ghosts

The vector of ghosts added by the dag_delta

Definition at line 66 of file dag_delta.h.

10.67.5.3 std::vector<walker> coco::dag_undelta::added_nodes

The vector of nodes added by the dag_delta

Definition at line 60 of file dag_delta.h.

10.67.5.4 std::vector<walker> coco::dag_undelta::added_objectives

The vector of objectives added by the dag_delta

Definition at line 62 of file dag_delta.h.

10.67.5.5 std::vector<walker> coco::dag_undelta::added_vars

The vector of variables added by the dag_delta

Definition at line 68 of file dag_delta.h.

10.67.5.6 std::map<unsigned int, interval> coco::dag_undelta::bounds_chgd

This map maps node numbers of ghosts overlaid over other nodes to the bounds of the nodes being overlaid prior to the application of the dag_delta.

Definition at line 73 of file dag_delta.h.

10.67.5.7 bool coco::dag_undelta::is_full_undelta

This variable is used to decide whether the dag_delta was a full model delta or an incremental delta.

Definition at line 77 of file dag_delta.h.

10.67.5.8 gptr<model>* coco::dag_undelta::old_model

This variable holds the complete old model, in case the dag_delta made a full model delta (is_full_undelta == `true`)

Definition at line 50 of file dag_delta.h.

10.67.5.9 counted_ptr<model> coco::dag_undelta::rm_dag

This variable holds the subgraph induced by all nodes which have been removed by the dag_delta.

Definition at line 54 of file dag_delta.h.

10.67.5.10 std::vector<model::enhanced_edge> coco::dag_undelta::rm_e

This variable holds the edges which had connected the removed subgraph to the remaining DAG prior to its removal by the dag_delta.

Definition at line 57 of file dag_delta.h.

The documentation for this class was generated from the following files:

- dag_delta.h
- dag_delta.cc

10.68 coco::coco::datamap Class Reference

The base class for communicating with COCONUT modules.

10.68.1 Detailed Description

This class is the base class for all classes used for communicating with COCONUT modules. It is basically a map of strings (variable names) to basic_alltype values (the variable values).

10.68.2 Constructor & Destructor Documentation

10.68.2.1 coco::coco::datamap::datamap ( ) [inline]

Standard Constructor

Definition at line 66 of file search_graph.cc.

10.68.2.2 coco::coco::datamap::datamap (const std::string & __n, const basic_alltype & __v) [inline]

Constructor setting the variable __n to value __v.

Definition at line 68 of file search_graph.cc.

10.68.2.3 coco::coco::datamap::datamap (const char * __n, const basic_alltype & __v) [inline]

Constructor setting the variable __n to value __v.

Definition at line 72 of file search_graph.cc.

10.68.2.4 coco::coco::datamap::datamap (const datamap & __c) [inline]

Standard Copy Constructor

Definition at line 76 of file search_graph.cc.

10.68.2.5 virtual coco::coco::datamap::~datamap ( ) [inline, virtual]

Standard Destructor

Definition at line 78 of file search_graph.cc.

10.68.3 Member Function Documentation

10.68.3.1 bool coco::datamap::defd (const std::string & __s) const [inline]

This method returns whether the variable with name __s is defined.

Definition at line 109 of file datamap.hpp.

10.68.3.2 bool coco::datamap::defd (const char * __s) const [inline]

This method returns whether the variable with name __s is defined.

Definition at line 114 of file datamap.hpp.

10.68.3.3 bool coco::datamap::defd (const std::string & __s, int i) const [inline]

This method returns whether the variable with name __s and index is defined.

Definition at line 119 of file datamap.hpp.

10.68.3.4 bool coco::datamap::defd (const char * __s, int i) const [inline]

This method returns whether the variable with name __s and index is defined.

Definition at line 124 of file datamap.hpp.

10.68.3.5 void coco::datamap::list (std::vector< std::string > & __v) const

The list method sets __v to the list of entry keys stored in this datamap.

Reimplemented in coco::control_data.

Definition at line 101 of file datamap.cc.

10.68.3.6 void coco::datamap::remove (const std::string & __s) [inline]

The remove methods remove the variable with name __s from the datamap.

Definition at line 57 of file datamap.hpp.

10.68.3.7 void coco::datamap::remove (const char * __s) [inline]

The remove methods remove the variable with name __s from the datamap.

Definition at line 65 of file datamap.hpp.

10.68.3.8 void coco::datamap::remove (const std::string & __s, int i) [inline]

The remove methods remove the variable with name __s and index i from the datamap.

Definition at line 70 of file datamap.hpp.

10.68.3.9 void coco::datamap::remove (const char * __s, int i) [inline]

The remove methods remove the variable with name __s and index i from the datamap.

Definition at line 76 of file datamap.hpp.

10.68.3.10 bool coco::datamap::retrieve (const std::string & __s, bool & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 149 of file datamap.hpp.

10.68.3.11 bool coco::datamap::retrieve (const std::string & __s, int & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 169 of file datamap.hpp.

10.68.3.12 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 191 of file datamap.hpp.

10.68.3.13 bool coco::datamap::retrieve (const std::string & __s, double & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 213 of file datamap.hpp.

10.68.3.14 bool coco::datamap::retrieve (const std::string & __s, interval & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 235 of file datamap.hpp.

10.68.3.15 bool coco::datamap::retrieve (const std::string & __s, std::string & __is) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 257 of file datamap.hpp.

10.68.3.16 bool coco::datamap::retrieve (const std::string & __s, num::Number & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 279 of file datamap.hpp.

10.68.3.17 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 301 of file datamap.hpp.

10.68.3.18 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 323 of file datamap.hpp.

10.68.3.19 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 345 of file datamap.hpp.

10.68.3.20 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 367 of file datamap.hpp.

10.68.3.21 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 389 of file datamap.hpp.

10.68.3.22 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 411 of file datamap.hpp.

10.68.3.23 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 433 of file datamap.hpp.

10.68.3.24 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 455 of file datamap.hpp.

10.68.3.25 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 477 of file datamap.hpp.

10.68.3.26 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 499 of file datamap.hpp.

10.68.3.27 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 521 of file datamap.hpp.

10.68.3.28 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 543 of file datamap.hpp.

10.68.3.29 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 565 of file datamap.hpp.

10.68.3.30 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 587 of file datamap.hpp.

10.68.3.31 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 609 of file datamap.hpp.

10.68.3.32 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 631 of file datamap.hpp.

10.68.3.33 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 653 of file datamap.hpp.

10.68.3.34 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 675 of file datamap.hpp.

10.68.3.35 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 697 of file datamap.hpp.

10.68.3.36 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 719 of file datamap.hpp.

10.68.3.37 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 741 of file datamap.hpp.

10.68.3.38 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 763 of file datamap.hpp.

10.68.3.39 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 785 of file datamap.hpp.

10.68.3.40 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 807 of file datamap.hpp.

10.68.3.41 bool coco::datamap::retrieve (const char * __s, bool & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 829 of file datamap.hpp.

10.68.3.42 bool coco::datamap::retrieve (const char * __s, int & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 839 of file datamap.hpp.

10.68.3.43 bool coco::datamap::retrieve (const char * __s, unsigned int & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 849 of file datamap.hpp.

10.68.3.44 bool coco::datamap::retrieve (const char * __s, double & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 859 of file datamap.hpp.

10.68.3.45 bool coco::datamap::retrieve (const char * __s, interval & __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 869 of file datamap.hpp.

10.68.3.46 bool coco::datamap::retrieve (const char * __s, std::string & __is) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 879 of file datamap.hpp.

10.68.3.47 bool coco::datamap::retrieve (const char * __s, num::Number & __is) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 889 of file datamap.hpp.

10.68.3.48 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 899 of file datamap.hpp.

10.68.3.49 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 919 of file datamap.hpp.

10.68.3.50 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 909 of file datamap.hpp.

10.68.3.51 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 929 of file datamap.hpp.

10.68.3.52 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 939 of file datamap.hpp.

10.68.3.53 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 949 of file datamap.hpp.

10.68.3.54 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 959 of file datamap.hpp.

10.68.3.55 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 969 of file datamap.hpp.

10.68.3.56 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 989 of file datamap.hpp.

10.68.3.57 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 979 of file datamap.hpp.

10.68.3.58 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 999 of file datamap.hpp.

10.68.3.59 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1009 of file datamap.hpp.

10.68.3.60 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1019 of file datamap.hpp.

10.68.3.61 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1029 of file datamap.hpp.

10.68.3.62 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1039 of file datamap.hpp.

10.68.3.63 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1050 of file datamap.hpp.

10.68.3.64 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1061 of file datamap.hpp.

10.68.3.65 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1072 of file datamap.hpp.

10.68.3.66 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1083 of file datamap.hpp.

10.68.3.67 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1094 of file datamap.hpp.

10.68.3.68 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1105 of file datamap.hpp.

10.68.3.69 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1116 of file datamap.hpp.

10.68.3.70 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1127 of file datamap.hpp.

10.68.3.71 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1138 of file datamap.hpp.

10.68.3.72 bool coco::datamap::retrieve (const std::string & __s, bool & __v, bool __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 159 of file datamap.hpp.

10.68.3.73 bool coco::datamap::retrieve (const std::string & __s, int & __v, int __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 181 of file datamap.hpp.

10.68.3.74 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v, unsigned int __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 203 of file datamap.hpp.

10.68.3.75 bool coco::datamap::retrieve (const std::string & __s, double & __v, double __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 225 of file datamap.hpp.

10.68.3.76 bool coco::datamap::retrieve (const std::string & __s, interval & __v, const interval & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 247 of file datamap.hpp.

10.68.3.77 bool coco::datamap::retrieve (const std::string & __s, std::string & __is, const std::string & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 269 of file datamap.hpp.

10.68.3.78 bool coco::datamap::retrieve (const std::string & __s, num::Number & __is, const num::Number & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 291 of file datamap.hpp.

10.68.3.79 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 313 of file datamap.hpp.

10.68.3.80 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v, const std::vector< int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 335 of file datamap.hpp.

10.68.3.81 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 357 of file datamap.hpp.

10.68.3.82 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v, const std::vector< double > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 379 of file datamap.hpp.

10.68.3.83 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 401 of file datamap.hpp.

10.68.3.84 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 423 of file datamap.hpp.

10.68.3.85 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 445 of file datamap.hpp.

10.68.3.86 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 467 of file datamap.hpp.

10.68.3.87 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 489 of file datamap.hpp.

10.68.3.88 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 511 of file datamap.hpp.

10.68.3.89 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< double > *& __v*, const vmtl::sparse_vector< double > * *__def*) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 533 of file datamap.hpp.

10.68.3.90 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< interval > *& __v*, const vmtl::sparse_vector< interval > * *__def*) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 555 of file datamap.hpp.

10.68.3.91 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< std::string > *& __v*, const vmtl::sparse_vector< std::string > * *__def*) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 577 of file datamap.hpp.

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 687 of file datamap.hpp.

10.68.3.97 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 709 of file datamap.hpp.

10.68.3.98 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 731 of file datamap.hpp.

10.68.3.99 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 753 of file datamap.hpp.

10.68.3.100 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 775 of file datamap.hpp.

10.68.3.101 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 797 of file datamap.hpp.

10.68.3.102 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 819 of file datamap.hpp.

10.68.3.103 bool coco::datamap::retrieve (const char * __s, bool & __v, bool __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 834 of file datamap.hpp.

10.68.3.104 bool coco::datamap::retrieve (const char * __s, int & __v, int __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 844 of file datamap.hpp.

10.68.3.105 bool coco::datamap::retrieve (const char * __s, unsigned int & __v, unsigned int __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 854 of file datamap.hpp.

10.68.3.106 bool coco::datamap::retrieve (const char * __s, double & __v, double __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 864 of file datamap.hpp.

10.68.3.107 bool coco::datamap::retrieve (const char * __s, interval & __v, const interval & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 874 of file datamap.hpp.

10.68.3.108 bool coco::datamap::retrieve (const char * __s, std::string & __v, const std::string & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 884 of file datamap.hpp.

10.68.3.109 bool coco::datamap::retrieve (const char * __s, num::Number & __v, const num::Number & __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 894 of file datamap.hpp.

10.68.3.110 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 904 of file datamap.hpp.

10.68.3.111 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 924 of file datamap.hpp.

10.68.3.112 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v, const std::vector< int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 914 of file datamap.hpp.

10.68.3.113 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v, const std::vector< double > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 934 of file datamap.hpp.

10.68.3.114 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 944 of file datamap.hpp.

10.68.3.115 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 954 of file datamap.hpp.

10.68.3.116 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 964 of file datamap.hpp.

10.68.3.117 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 974 of file datamap.hpp.

10.68.3.118 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 994 of file datamap.hpp.

10.68.3.119 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 984 of file datamap.hpp.

10.68.3.120 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const [inline]

Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1510 of file datamap.hpp.

10.68.3.153 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1530 of file datamap.hpp.

10.68.3.154 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1550 of file datamap.hpp.

10.68.3.155 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1570 of file datamap.hpp.

10.68.3.156 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1590 of file datamap.hpp.

10.68.3.157 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< interval > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1610 of file datamap.hpp.

10.68.3.158 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< std::string > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1630 of file datamap.hpp.

10.68.3.159 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< num::Number > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1650 of file datamap.hpp.

10.68.3.160 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< double > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1670 of file datamap.hpp.

10.68.3.161 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< int > *& __v) const [inline]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2084 of file datamap.hpp.

10.68.3.258 const basic_alltype & coco::datamap::sfind (const std::string & __s) const [inline]

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 81 of file datamap.hpp.

10.68.3.259 const basic_alltype & coco::datamap::sfind (const char * __s) const [inline]

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 90 of file datamap.hpp.

10.68.3.260 const basic_alltype & coco::datamap::sfind (const std::string & __s, int i) const [inline]

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 95 of file datamap.hpp.

10.68.3.261 const basic_alltype & coco::datamap::sfind (const char * __s, int i) const [inline]

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 104 of file datamap.hpp.

10.68.3.262 bool coco::datamap::sinsert (const std::string & __s, const basic_alltype & __h, bool replace)

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.cc.

10.68.3.263 bool coco::datamap::sinsert (const char * __s, const basic_alltype & __h, bool replace) [inline]

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.hpp.

10.68.3.264 bool coco::datamap::sinsert (const std::string & __s, int i, const basic_alltype & __h, bool replace) [inline]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 42 of file datamap.hpp.

10.68.3.265 bool coco::datamap::sinsert (const char * __s, int i, const basic_alltype & __h, bool replace) [inline]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 50 of file datamap.hpp.

10.68.3.266 bool coco::datamap::which (const std::string & __s, std::vector< int > & __idx) const [inline]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 129 of file datamap.hpp.

10.68.3.267 bool coco::datamap::which (const char * __s, std::vector< int > & __idx) const [inline]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 143 of file datamap.hpp.

The documentation for this class was generated from the following files:

- datamap.h
- datamap.cc
- datamap.hpp

10.69 coco::datamap Class Reference

The base class for communicating with COCONUT modules.

`#include <datamap.h>`

10.69.1 Detailed Description

This class is the base class for all classes used for communicating with COCONUT modules. It is basically a map of strings (variable names) to basic_alltype values (the variable values).

10.69.2 Constructor & Destructor Documentation

10.69.2.1 coco::datamap::datamap ( ) [inline]

Standard Constructor

Definition at line 66 of file datamap.h.

10.69.2.2 coco::datamap::datamap (const std::string & __n, const basic_alltype & __v) [inline]

Constructor setting the variable __n to value __v.

Definition at line 68 of file datamap.h.

10.69.2.3 coco::datamap::datamap (const char * __n, const basic_alltype & __v) [inline]

Constructor setting the variable __n to value __v.

Definition at line 72 of file datamap.h.

10.69.2.4 coco::datamap::datamap (const datamap & __c) [inline]

Standard Copy Constructor

Definition at line 76 of file datamap.h.

10.69.2.5 virtual coco::datamap::~datamap ( ) [inline, virtual]

Standard Destructor

Definition at line 78 of file datamap.h.

10.69.3 Member Function Documentation

10.69.3.1 bool coco::datamap::defd (const std::string & __s) const

This method returns whether the variable with name __s is defined.

10.69.3.2 bool coco::datamap::defd (const char * __s) const

This method returns whether the variable with name __s is defined.

10.69.3.3 bool coco::datamap::defd (const std::string & __s, int i) const

This method returns whether the variable with name __s and index is defined.

10.69.3.4 bool coco::datamap::defd (const char * __s, int i) const

This method returns whether the variable with name __s and index is defined.

10.69.3.5 void coco::datamap::list (std::vector< std::string > & __v) const

The list method sets __v to the list of entry keys stored in this datamap.

10.69.3.6 void coco::datamap::remove (const std::string & __s)

The remove methods remove the variable with name __s from the datamap.

10.69.3.7 void coco::datamap::remove (const char * __s)

The remove methods remove the variable with name __s from the datamap.

10.69.3.8 void coco::datamap::remove (const std::string & __s, int i)

The remove methods remove the variable with name __s and index i from the datamap.

10.69.3.9 void coco::datamap::remove (const char * __s, int i)

The remove methods remove the variable with name __s and index i from the datamap.

10.69.3.10 bool coco::datamap::retrieve (const std::string & __s, bool & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.11 bool coco::datamap::retrieve (const std::string & __s, int & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.12 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.13 bool coco::datamap::retrieve (const std::string & __s, double & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.14 bool coco::datamap::retrieve (const std::string & __s, interval & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.15 bool coco::datamap::retrieve (const std::string & __s, std::string & __is) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.16 bool coco::datamap::retrieve (const std::string & __s, num::Number & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.17 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.18 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.19 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.20 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.21 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.22 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.23 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.24 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.25 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.26 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.27 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.28 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.29 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.30 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.31 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.32 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.33 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.34 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.35 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.36 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.37 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.38 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.39 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.40 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.41 bool coco::datamap::retrieve (const char * __s, bool & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.42 bool coco::datamap::retrieve (const char * __s, int & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.43 bool coco::datamap::retrieve (const char * __s, unsigned int & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.44 bool coco::datamap::retrieve (const char * __s, double & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.45 bool coco::datamap::retrieve (const char * __s, interval & __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.46 bool coco::datamap::retrieve (const char * __s, std::string & __is) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.47 bool coco::datamap::retrieve (const char * __s, num::Number & __is) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.48 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.49 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.50 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.51 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to

the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.52 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.53 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.54 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.55 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.56 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.57 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.58 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.59 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.60 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.61 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.62 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.63 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.64 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.65 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.66 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.67 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.68 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.69 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.70 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.71 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.72 bool coco::datamap::retrieve (const std::string & __s, bool & __v, bool __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.73 bool coco::datamap::retrieve (const std::string & __s, int & __v, int __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.74 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v, unsigned int __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.75 bool coco::datamap::retrieve (const std::string & __s, double & __v, double __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.76 bool coco::datamap::retrieve (const std::string & __s, interval & __v, const interval & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.77 bool coco::datamap::retrieve (const std::string & __s, std::string & __is, const std::string & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.78 bool coco::datamap::retrieve (const std::string & __s, num::Number & __is, const num::Number & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.79 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.80 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v, const std::vector< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.81 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.82 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v, const std::vector< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.83 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.84 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.85 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.86 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.87 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< int > *& *__v*, const vmtl::sparse_vector< int > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.88 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< unsigned int > *& *__v*, const vmtl::sparse_vector< unsigned int > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.89 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< double > *& *__v*, const vmtl::sparse_vector< double > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.90 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< interval > *& *__v*, const vmtl::sparse_vector< interval > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.91 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< std::string > *& *__v*, const vmtl::sparse_vector< std::string > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.92 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< num::Number > *& *__v*, const vmtl::sparse_vector< num::Number > * *__def*) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.93 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.94 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.95 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.96 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v, const vmtl::dense_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.97 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.98 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.99 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.100 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.101 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.102 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.103 bool coco::datamap::retrieve (const char * __s, bool & __v, bool __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.104 bool coco::datamap::retrieve (const char * __s, int & __v, int __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.105 bool coco::datamap::retrieve (const char * __s, unsigned int & __v, unsigned int __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.106 bool coco::datamap::retrieve (const char * __s, double & __v, double __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.107 bool coco::datamap::retrieve (const char * __s, interval & __v, const interval & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.108 bool coco::datamap::retrieve (const char * __s, std::string & __v, const std::string & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.109 bool coco::datamap::retrieve (const char * __s, num::Number & __v, const num::Number & __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.110 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.111 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.112 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v, const std::vector< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.113 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v, const std::vector< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.114 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.115 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.116 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.117 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.118 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.119 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.120 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.121 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.122 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v, const vmtl::sparse_vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.123 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v, const vmtl::sparse_vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.124 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.125 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.126 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.127 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< std::string > *& __v, const vmtl::dense_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.128 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.129 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.130 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.131 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.132 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.133 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.134 bool coco::datamap::retrieve_i (const std::string & __s, int i, bool & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.135 bool coco::datamap::retrieve_i (const std::string & __s, int i, int & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.136 bool coco::datamap::retrieve_i (const std::string & __s, int i, unsigned int & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.137 bool coco::datamap::retrieve_i (const std::string & __s, int i, double & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.138 bool coco::datamap::retrieve_i (const std::string & __s, int i, interval & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.139 bool coco::datamap::retrieve_i (const std::string & __s, int i, std::string & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.140 bool coco::datamap::retrieve_i (const std::string & __s, int i, num::Number & __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.141 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.142 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.143 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.144 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.145 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.146 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.147 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.148 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.149 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.150 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.151 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.152 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.153 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.154 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.155 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.156 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.157 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.158 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.159 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.160 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.161 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.162 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.163 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.164 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.165 bool coco::datamap::retrieve_i (const char * __s, int i, bool & __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.166 bool coco::datamap::retrieve_i (const char * __s, int i, int & __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.167 bool coco::datamap::retrieve_i (const char * __s, int i, unsigned int & __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.168 bool coco::datamap::retrieve_i (const char * __s, int i, double & __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.169 bool coco::datamap::retrieve_i (const char * __s, int i, interval & __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.170 bool coco::datamap::retrieve_i (const char * __s, int i, std::string & __is) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.171 bool coco::datamap::retrieve_i (const char * __s, int i, num::Number & __is) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.172 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< bool > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.173 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< int > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.174 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.175 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< double > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.176 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< interval > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.177 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< std::string > *& __v) const

The retrieve methods assign the value of the variable ___s with index i to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.178 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.179 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< bool > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.180 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.181 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< unsigned int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.182 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.183 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.184 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.185 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.186 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.187 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.188 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.189 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.190 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.191 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< double > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.192 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< int > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.193 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< interval > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.194 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< std::string > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.195 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< num::Number > *& __v) const

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.196 bool coco::datamap::retrieve_i (const std::string & __s, int i, bool & __v, bool __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.197 bool coco::datamap::retrieve_i (const std::string & __s, int i, int & __v, int __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.198 bool coco::datamap::retrieve_i (const std::string & __s, int i, unsigned int & __v, unsigned int __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.199 bool coco::datamap::retrieve_i (const std::string & __s, int i, double & __v, double __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.200 bool coco::datamap::retrieve_i (const std::string & __s, int i, interval & __v, const interval & __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.201 bool coco::datamap::retrieve_i (const std::string & __s, int i, std::string & __is, const std::string & __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.202 bool coco::datamap::retrieve_i (const std::string & __s, int i, num::Number & __is, const num::Number & __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.203 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< bool > *& __v, const std::vector< bool > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.204 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< int > *& __v, const std::vector< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.205 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the

simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.206 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< double > *& __v, const std::vector< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.207 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< interval > *& __v, const std::vector< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.208 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.209 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.210 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.211 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.212 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.213 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.214 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.215 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< std::string > *& __v, const vmtl::sparse_vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.216 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< num::Number > *& __v, const vmtl::sparse_vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.217 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.218 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the

simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.219 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.220 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< std::string > *& __v, const vmtl::dense_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.221 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.222 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.223 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.224 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.225 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.226 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.227 bool coco::datamap::retrieve_i (const char * __s, int i, bool & __v, bool __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.228 bool coco::datamap::retrieve_i (const char * __s, int i, int & __v, int __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.229 bool coco::datamap::retrieve_i (const char * __s, int i, unsigned int & __v, unsigned int __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.230 bool coco::datamap::retrieve_i (const char * __s, int i, double & __v, double __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.231 bool coco::datamap::retrieve_i (const char * __s, int i, interval & __v, const interval & __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.232 bool coco::datamap::retrieve_i (const char * __s, int i, std::string & __v, const std::string & __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.233 bool coco::datamap::retrieve_i (const char * __s, int i, num::Number & __v, const num::Number & __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.234 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< bool > *& __v, const std::vector< bool > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.235 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< int > *& __v, const std::vector< int > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.236 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.237 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< double > *& __v, const std::vector< double > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.238 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< interval > *& __v, const std::vector< interval > * __def) const

The retrieve methods assign the value of the variable ___s with index i to * the variable ___v. It is returned whether the variable is set. If * the variable is not set, the value of ___def is assigned to ___v. Note that the

simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.239 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.240 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.241 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.242 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.243 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.244 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.245 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.246 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< std::string > *& __v, const vmtl::sparse_vector< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.247 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< num::Number > *& __v, const vmtl::sparse_vector< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.248 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< double > *& __v, const vmtl::dense_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.249 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< int > *& __v, const vmtl::dense_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.250 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.251 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< std::string > *& __v, const vmtl::dense_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the

simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.252 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.253 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.254 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.255 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.256 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.257 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

10.69.3.258 const basic_alltype& coco::datamap::sfind (const std::string & __s) const

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

10.69.3.259 const basic_alltype& coco::datamap::sfind (const char * __s) const

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

10.69.3.260 const basic_alltype& coco::datamap::sfind (const std::string & __s, int i) const

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

10.69.3.261 const basic_alltype& coco::datamap::sfind (const char * __s, int i) const

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

10.69.3.262 bool coco::datamap::sinsert (const std::string & __s, const basic_alltype & __h, bool replace)

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

10.69.3.263 bool coco::datamap::sinsert (const char * __s, const basic_alltype & __h, bool replace)

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

10.69.3.264 bool coco::datamap::sinsert (const std::string & __s, int i, const basic_alltype & __h, bool replace)

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

10.69.3.265 bool coco::datamap::sinsert (const char * __s, int i, const basic_alltype & __h, bool replace)

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

10.69.3.266 bool coco::datamap::which (const std::string & __s, std::vector< int > & __idx) const

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

10.69.3.267 bool coco::datamap::which (const char * __s, std::vector< int > & __idx) const

The which methods sets ___idx to the list of indices defined for the variable with name ___s. The methods return whether the variable ___s is defined.

10.80.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural interval extension.

10.80.2 Member Typedef Documentation

10.80.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.80.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.80.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.80.3 Constructor & Destructor Documentation

10.80.3.1 coco::dd1f_interval_eval::dd1f_interval_eval (const std::vector< interval > & __x, const variable_indicator & __v, const model & __m, std::vector< interval > * __c, bool do_i = true, const std::map< unsigned int, d1func * > * _pi = NULL, unsigned int __tn = 0) [inline]

Constructor: ___x is the box over which the function range shall be evaluated, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___c the cache (may be NULL). The boolean do_i determines whether the natural interval extension will use known node ranges for reducing the ranges.

10.80.4 Member Function Documentation

10.80.4.1 void coco::dd1f_interval_eval::calculate (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 254 of file dagd1func_ie.h.

10.80.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.80.4.3 interval coco::dd1f_interval_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< dd1f_interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 767 of file dagd1func_ie.h.

10.80.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.80.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.80.4.6 void coco::dd1f_interval_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< dd1f_interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 179 of file dagd1func_ie.h.

10.80.4.7 int coco::dd1f_interval_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 181 of file dagd1func_ie.h.

10.80.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.80.4.9 bool coco::dd1f_interval_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< dd1f_interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 88 of file dagd1func_ie.h.

10.80.4.10 void coco::dd1f_interval_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 171 of file dagd1func_ie.h.

10.80.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.80.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.80.4.13 void coco::dd1f_interval_eval::retrieve_from_cache (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 265 of file dagd1func_ie.h.

10.80.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.80.4.15 expression_const_walker coco::dd1f_interval_eval::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 165 of file dagd1func_ie.h.

10.80.4.16 int coco::dd1f_interval_eval::update (const interval & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 280 of file dagd1func_ie.h.

10.80.4.17 int coco::dd1f_interval_eval::update (const expression_node & *__data,* const interval & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 286 of file dagd1func_ie.h.

10.80.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data,* const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.80.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.80.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.80.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.80.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.80.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.82.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural interval extension.

10.82.2 Member Typedef Documentation

10.82.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.82.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.82.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.82.3 Constructor & Destructor Documentation

10.82.3.1 coco::defdom_eval::defdom_eval (const std::vector< interval > & __x, const variable_indicator & __v, const model & __m, defdom_map & __p, std::vector< interval > * __c) [inline]

Constructor: __x is the box over which the function range shall be evaluated, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, and __c

the cache (may be NULL). The boolean do_i determines whether the natural interval extension will use known node ranges for reducing the ranges.

Definition at line 216 of file defdom_evaluator.h.

10.82.3.2 coco::defdom_eval::defdom_eval (const defdom_eval & __v) [inline]

Standard Copy Constructor

Definition at line 230 of file defdom_evaluator.h.

10.82.3.3 coco::defdom_eval::~defdom_eval ( ) [inline]

Standard Destructor

Definition at line 233 of file defdom_evaluator.h.

10.82.4 Member Function Documentation

10.82.4.1 void coco::defdom_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 321 of file defdom_evaluator.h.

10.82.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.82.4.3 defdom_ret_type coco::defdom_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< defdom_eval_type, expression_node, defdom_ret_type, expression_const_walker >.

Definition at line 973 of file defdom_evaluator.h.

10.82.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.82.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.82.4.6 void coco::defdom_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< defdom_eval_type, expression_node, defdom_ret_type, expression_const_walker >.

Definition at line 250 of file defdom_evaluator.h.

10.82.4.7 int coco::defdom_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 252 of file defdom_evaluator.h.

10.82.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.82.4.9 bool coco::defdom_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< defdom_eval_type, expression_node, defdom_ret_type, expression_const_walker >.

Definition at line 117 of file defdom_evaluator.h.

10.82.4.10 void coco::defdom_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 242 of file defdom_evaluator.h.

10.82.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.82.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.82.4.13 void coco::defdom_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 332 of file defdom_evaluator.h.

10.82.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.82.4.15 expression_const_walker coco::defdom_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 236 of file defdom_evaluator.h.

10.82.4.16 int coco::defdom_eval::update (const defdom_ret_type & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 352 of file defdom_evaluator.h.

10.82.4.17 int coco::defdom_eval::update (const expression_node & __data, const defdom_ret_type & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 358 of file defdom_evaluator.h.

10.82.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.82.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.82.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.82.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.82.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.82.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

- std::ostream & operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.

10.86.1 Detailed Description

The delta class is used to store deltas (updates to search_nodes in the search_graph). It is designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded. Deltas are stored in the search database table `deltas`.

10.86.2 Constructor & Destructor Documentation

10.86.2.1 coco::delta::delta ( ) [inline]

Standard Constructor

Definition at line 72 of file api_deltabase.h.

10.86.2.2 coco::delta::delta (const delta_base & __d)

Constructor, which constructs a delta from a delta_base. The clone operation for the delta_base will be called in that process.

10.86.2.3 coco::delta::delta (const delta & _d)

Copy Constructor, which constructs a new delta from an existing delta. The clone operation for the delta_base will be called in that process, effectively overloading the copy constructor for the delta_base.

10.86.2.4 coco::delta::~delta ( )

Destructor, which frees the _d using `delete`

10.86.3 Member Function Documentation

10.86.3.1 bool coco::delta::apply (work_node & _x, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x

10.86.3.2 bool coco::delta::apply3 (work_node & _x, const work_node & _y, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x.

10.86.3.3 void coco::delta::convert (work_node & _x)

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

10.86.3.4 const std::string& coco::delta::get_action ( ) const

Retrieve the action information (the delta type) for this delta.

10.86.3.5 const delta_base* coco::delta::get_base ( ) const

Return the delta_base stored in this wrapper

10.86.3.6 bool coco::delta::operator!= (const delta & _c) const

10.86.3.7 delta& coco::delta::operator= (const delta & _d)

Assignment operator, which uses the clone operation for the delta_base, effectively overloading the assignment operator for the delta_base.

10.86.3.8 bool coco::delta::operator== (const delta & _c) const

Comparison operators

10.86.3.9 delta_id coco::delta::store (work_node & _x, const certificate & _c)

Store the delta along with certificate _c in work_node _x. This work_node then **keeps** the delta. The created delta_id of the delta is returned.

10.86.3.10 void coco::delta::unkeep ( )

This method is called when the delta is permanently applied and it signals the delta that certain data structures should be kept intact, even if the delta is destroyed.

10.86.4 Friends And Related Function Documentation

10.87.1 Detailed Description

The delta class is used to store deltas (updates to search_nodes in the search_graph). It is designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded. Deltas are stored in the search database table `deltas`.

Definition at line 64 of file search_graph.cc.

10.87.2 Constructor & Destructor Documentation

10.87.2.1 coco::coco::delta::delta ( ) [inline]

Standard Constructor

Definition at line 72 of file search_graph.cc.

10.87.2.2 coco::coco::delta::delta (const delta_base & __d) [inline]

Constructor, which constructs a delta from a delta_base. The clone operation for the delta_base will be called in that process.

Definition at line 112 of file api_delta.h.

10.87.2.3 coco::coco::delta::delta (const delta & __d) [inline]

Copy Constructor, which constructs a new delta from an existing delta. The clone operation for the delta_base will be called in that process, effectively overloading the copy constructor for the delta_base.

Definition at line 114 of file api_delta.h.

10.87.2.4 coco::coco::delta::~delta ( ) [inline]

Destructor, which frees the _d using `delete`

Definition at line 120 of file api_delta.h.

10.87.2.5 coco::coco::delta::delta ( ) [inline]

Standard Constructor

Definition at line 72 of file search_graph.cc.

10.87.2.6 coco::coco::delta::delta (const delta_base & __d)

Constructor, which constructs a delta from a delta_base. The clone operation for the delta_base will be called in that process.

10.87.2.7 coco::coco::delta::delta (const delta & __d)

Copy Constructor, which constructs a new delta from an existing delta. The clone operation for the delta_base will be called in that process, effectively overloading the copy constructor for the delta_base.

10.87.2.8 coco::coco::delta::~delta ( )

Destructor, which frees the _d using `delete`

10.87.2.9 coco::coco::delta::delta ( ) [inline]

Standard Constructor

Definition at line 72 of file search_graph.cc.

10.87.2.10 coco::coco::delta::delta (const delta_base & __d)

Constructor, which constructs a delta from a delta_base. The clone operation for the delta_base will be called in that process.

10.87.2.11 coco::coco::delta::delta (const delta & __d)

Copy Constructor, which constructs a new delta from an existing delta. The clone operation for the delta_base will be called in that process, effectively overloading the copy constructor for the delta_base.

10.87.2.12 coco::coco::delta::~delta ( )

Destructor, which frees the _d using `delete`

10.87.3 Member Function Documentation

10.87.3.1 bool coco::coco::delta::apply (work_node & _x, const delta_id & _d) const [inline]

Apply the delta with delta_id _d to work node _x

Definition at line 139 of file api_delta.h.

10.87.3.2 bool coco::coco::delta::apply (work_node & _x, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x

10.87.3.3 bool coco::coco::delta::apply (work_node & _x, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x

10.87.3.4 bool coco::coco::delta::apply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [inline]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x.

Definition at line 160 of file api_delta.h.

10.87.3.5 bool coco::coco::delta::apply3 (work_node & _x, const work_node & _y, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x.

10.87.3.6 bool coco::coco::delta::apply3 (work_node & _x, const work_node & _y, const delta_id & _d) const

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x.

10.87.3.7 void coco::coco::delta::convert (work_node & _x) [inline]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 182 of file api_delta.h.

10.87.3.8 void coco::coco::delta::convert (work_node & _x)

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

10.87.3.9 void coco::coco::delta::convert (work_node & _x)

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

10.87.3.10 const std::string& coco::coco::delta::get_action ( ) const

Retrieve the action information (the delta type) for this delta.

10.87.3.11 const std::string& coco::coco::delta::get_action ( ) const

Retrieve the action information (the delta type) for this delta.

10.87.3.12 const std::string & coco::coco::delta::get_action ( ) const [inline]

Retrieve the action information (the delta type) for this delta.

Definition at line 136 of file api_delta.h.

10.87.3.13 const delta_base * coco::coco::delta::get_base ( ) const [inline]

Return the delta_base stored in this wrapper

Definition at line 137 of file api_delta.h.

10.87.3.14 const delta_base* coco::coco::delta::get_base ( ) const

Return the delta_base stored in this wrapper

10.87.3.15 const delta_base* coco::coco::delta::get_base ( ) const

Return the delta_base stored in this wrapper

10.87.3.16 bool coco::coco::delta::operator!= (const delta & _c) const [inline]

Definition at line 195 of file api_delta.h.

10.87.3.17 bool coco::coco::delta::operator!= (const delta & _c) const

10.87.3.18 bool coco::coco::delta::operator!= (const delta & _c) const

10.87.3.19 delta & coco::coco::delta::operator= (const delta & _d) [inline]

Assignment operator, which uses the clone operation for the delta_base, effectively overloading the assignment operator for the delta_base.

Definition at line 126 of file api_delta.h.

10.87.3.20 delta& coco::coco::delta::operator= (const delta & _d)

Assignment operator, which uses the clone operation for the delta_base, effectively overloading the assignment operator for the delta_base.

10.87.3.21 delta& coco::coco::delta::operator= (const delta & _d)

Assignment operator, which uses the clone operation for the delta_base, effectively overloading the assignment operator for the delta_base.

10.87.3.22 bool coco::coco::delta::operator== (const delta & _c) const [inline]

Comparison operators

Definition at line 192 of file api_delta.h.

10.87.3.23 bool coco::coco::delta::operator== (const delta & _c) const

Comparison operators

10.87.3.24 bool coco::coco::delta::operator== (const delta & _c) const

Comparison operators

10.87.3.25 delta_id coco::coco::delta::store (work_node & _x, const certificate & _c)

Store the delta along with certificate _c in work_node _x. This work_node then **keeps** the delta. The created delta_id of the delta is returned.

10.87.3.26 delta_id coco::coco::delta::store (work_node & _x, const certificate & _c)

Store the delta along with certificate _c in work_node _x. This work_node then **keeps** the delta. The created delta_id of the delta is returned.

10.87.3.27 delta_id coco::delta::store (work_node & _x, const certificate & _c)

Store the delta along with certificate _c in work_node _x. This work_node then **keeps** the delta. The created delta_id of the delta is returned.

Definition at line 37 of file delta.cc.

10.87.3.28 void coco::coco::delta::unkeep ( ) [inline]

This method is called when the delta is permanently applied and it signals the delta that certain data structures should be kept intact, even if the delta is destroyed.

Definition at line 190 of file api_delta.h.

10.87.3.29 void coco::coco::delta::unkeep ( )

This method is called when the delta is permanently applied and it signals the delta that certain data structures should be kept intact, even if the delta is destroyed.

10.87.3.30 void coco::coco::delta::unkeep ( )

This method is called when the delta is permanently applied and it signals the delta that certain data structures should be kept intact, even if the delta is destroyed.

10.87.4 Friends And Related Function Documentation

10.87.4.1 delta_base [friend]

Definition at line 127 of file search_graph.cc.

10.87.4.2 ie_return_type [friend]

Definition at line 128 of file search_graph.cc.

10.87.4.3 std::ostream& operator<< (std::ostream & *o*, const delta & *t*) [friend]

Stream output operator for deltas, which calls the get_action method of the delta.

Definition at line 137 of file search_graph.cc.

10.87.4.4 std::ostream& operator<< (std::ostream & *o*, const delta & *t*) [friend]

Stream output operator for deltas, which calls the get_action method of the delta.

Definition at line 137 of file search_graph.cc.

10.87.4.5 std::ostream& operator<< (std::ostream & *o*, const delta & *t*) [friend]

Stream output operator for deltas, which calls the get_action method of the delta.

Definition at line 137 of file search_graph.cc.

The documentation for this class was generated from the following files:

- api_deltabase.h
- api_delta.h
- delta.cc

10.88.1 Detailed Description

Base class for the deltas, which is wrapped by the delta class since copy constructors cannot directly be overloaded.

10.88.2 Constructor & Destructor Documentation

10.88.2.1 coco::delta_base::delta_base ( ) [inline]

Standard Constructor

Definition at line 158 of file api_deltabase.h.

10.88.2.2 coco::delta_base::delta_base (const std::string & *a*) [inline]

Constructor, explicitly setting the action to `a`

Definition at line 160 of file api_deltabase.h.

10.88.2.3 coco::delta_base::delta_base (const char * *a*) [inline]

Constructor, explicitly setting the action to `a`

Definition at line 162 of file api_deltabase.h.

10.88.2.4 coco::delta_base::delta_base (const delta_base & *__d*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 164 of file api_deltabase.h.

10.88.3 Member Function Documentation

10.88.3.1 virtual bool coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual]

Apply the delta with delta_id `_d` to work node `_x`. In this process the undo information for this delta is stored in `_u`.

Definition at line 198 of file api_deltabase.h.

10.88.3.2 virtual bool coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.88.3.3 virtual void coco::delta_base::convert (work_node & *_x*, delta_base *& *_d*) [inline, virtual]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file api_deltabase.h.

10.88.3.4 const std::string& coco::delta_base::get_action ( ) const [inline]

10.89.2.12 coco::coco::delta_base::delta_base (const delta_base & __d) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 164 of file search_graph.cc.

10.89.3 Member Function Documentation

10.89.3.1 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.89.3.2 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.89.3.3 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.89.3.4 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.89.3.5 bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [inline, virtual]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.89.3.6 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.89.3.7 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.89.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.89.3.9 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.89.3.10 const std::string& coco::coco::delta_base::get_action ( ) const [inline]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.89.3.11 const std::string& coco::coco::delta_base::get_action ( ) const [inline]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.89.3.12 const std::string& coco::coco::delta_base::get_action ( ) const [inline]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.89.3.13 delta coco::coco::delta_base::make_delta (const std::string & a) [inline]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.89.3.14 delta coco::coco::delta_base::make_delta (const std::string & a) [inline]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.89.3.15 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.89.3.16 virtual delta_base* coco::coco::delta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::semantics_delta, coco::dag_delta, coco::split_delta, coco::annotation_delta, coco::bound_delta, coco::table_delta, coco::infeasible_delta, coco::boxes_delta, and coco::point_delta.

Definition at line 167 of file search_graph.cc.

10.89.3.17 virtual delta_base* coco::coco::delta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::semantics_delta, coco::dag_delta, coco::split_delta, coco::annotation_delta, coco::bound_delta, coco::table_delta, coco::infeasible_delta, coco::boxes_delta, and coco::point_delta.

Definition at line 167 of file search_graph.cc.

10.89.3.18 virtual delta_base* coco::coco::delta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::semantics_delta, coco::dag_delta, coco::split_delta, coco::annotation_delta, coco::bound_delta, coco::table_delta, coco::infeasible_delta, coco::boxes_delta, and coco::point_delta.

Definition at line 167 of file search_graph.cc.

10.89.3.19 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.89.3.20 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.89.3.21 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.89.4 Member Data Documentation

10.89.4.1 std::string coco::coco::delta_base::_action [protected]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

The documentation for this class was generated from the following files:

- api_deltabase.h
- api_delta.h

10.90 coco::coco::delta_get_action Class Reference

Stored procedure class for computing the delta action specifier.

Public Types

- typedef vdbl::context context
- typedef std::string return_type

Public Member Functions

- delta_get_action (vdbl::colid _c)
- delta_get_action (const delta_get_action &_i)
- virtual ~delta_get_action ()
- const std::string & operator() () const
- const std::string & def () const
- void setcontext (const context *c, const vdbl::row *r)

10.90.1 Detailed Description

A database method returning the delta action specifier, used as a stored procedure.

10.90.2 Member Typedef Documentation

10.90.2.1 typedef vdbl::context coco::coco::delta_get_action::context

The evaluation context class

Definition at line 66 of file search_graph.cc.

10.90.2.2 typedef std::string coco::coco::delta_get_action::return_type

The return type of this stored procedure

Definition at line 68 of file search_graph.cc.

10.90.3 Constructor & Destructor Documentation

10.90.3.1 coco::coco::delta_get_action::delta_get_action (vdbl::colid _c) [inline]

Constructor, which sets the column id from _c

Definition at line 71 of file search_graph.cc.

10.90.3.2 coco::coco::delta_get_action::delta_get_action (const delta_get_action & _i) [inline]

Standard Copy Constructor

Definition at line 73 of file search_graph.cc.

10.90.3.3 virtual coco::coco::delta_get_action::~delta_get_action ( ) [inline, virtual]

Standard Destructor

Definition at line 76 of file search_graph.cc.

10.90.4 Member Function Documentation

10.90.4.1 const std::string& coco::coco::delta_get_action::def ( ) const [inline]

Default value of the procedure

Definition at line 81 of file search_graph.cc.

10.90.4.2 const std::string & coco::coco::delta_get_action::operator() ( ) const [inline]

Result of the procedure

Definition at line 98 of file api_delta.h.

10.90.4.3 void coco::coco::delta_get_action::setcontext (const context * c, const vdbl::row * r) [inline]

Set the evaluation context for row r and context c (ignored!)

Definition at line 83 of file search_graph.cc.

The documentation for this class was generated from the following file:

- api_delta.h

10.91 coco::delta_get_action Class Reference

Stored procedure class for computing the delta action specifier.

```
#include <api_delta.h>
```

Public Types

- typedef vdbl::context context
- typedef std::string return_type

Public Member Functions

- delta_get_action (vdbl::colid _c)
- delta_get_action (const delta_get_action &_i)
- virtual ~delta_get_action ()
- const std::string & operator() () const
- const std::string & def () const
- void setcontext (const context *c, const vdbl::row *r)

10.91.1 Detailed Description

A database method returning the delta action specifier, used as a stored procedure.

10.91.2 Member Typedef Documentation

10.91.2.1 typedef vdbl::context coco::delta_get_action::context

The evaluation context class

Definition at line 66 of file api_delta.h.

10.91.2.2 typedef std::string coco::delta_get_action::return_type

The return type of this stored procedure

Definition at line 68 of file api_delta.h.

10.91.3 Constructor & Destructor Documentation

10.91.3.1 coco::delta_get_action::delta_get_action (vdbl::colid _c) [inline]

Constructor, which sets the column id from _c

Definition at line 71 of file api_delta.h.

10.91.3.2 coco::delta_get_action::delta_get_action (const delta_get_action & _i) [inline]

Standard Copy Constructor

Definition at line 73 of file api_delta.h.

10.91.3.3 virtual coco::delta_get_action::~delta_get_action ( ) [inline, virtual]

Standard Destructor

Definition at line 76 of file api_delta.h.

10.91.4 Member Function Documentation

10.91.4.1 const std::string& coco::delta_get_action::def ( ) const [inline]

Default value of the procedure

Definition at line 81 of file api_delta.h.

10.91.4.2 const std::string& coco::delta_get_action::operator() ( ) const

Result of the procedure

10.91.4.3 void coco::delta_get_action::setcontext (const context * c, const vdbl::row * r) [inline]

Set the evaluation context for row `r` and context `c` (ignored!)

Definition at line 83 of file api_delta.h.

The documentation for this class was generated from the following file:

- api_delta.h

10.92 coco::coco::delta_node Class Reference

Class holding the delta nodes in the search graph.

Friends

- class search_graph

10.92.1 Detailed Description

This is a class of nodes stored in the search graph. It represents a delta node, i.e., a node which only stores the changes with respect to the parent model.

See also

delta

10.92.2 Constructor & Destructor Documentation

10.92.2.1 coco::coco::delta_node::delta_node (const search_node_id & *_i*, const vdbl::userid & *_dui*, std::vector< delta_id > & *__d*, gptr< search_node > & *_gm*, gptr< vdbl::database > & *_db*, search_node_relation *_snr* = `snr_reduction`) `[inline]`

This constructor generates a new delta node (a reduction node by default) with search_node_id `i` and search_node_relation `__snr` holding the delta ids stored in `__d`. The parameters `_gm`, `_db`, and `_dui` initialize the global model, search database, and the database user id, respectively.

Definition at line 220 of file search_graph.cc.

10.92.2.2 virtual coco::coco::delta_node::~delta_node ( ) `[inline, virtual]`

Standard Destructor

Definition at line 228 of file search_graph.cc.

10.92.3 Member Function Documentation

10.92.3.1 template<class _Iterator > void coco::coco::delta_node::add_deltas (_Iterator _f, _Iterator _l) [inline]

This method inserts all deltas in the collection of delta ids, which starts at iterator _f and ends before iterator _l to the list of delta ids in this delta node.

Definition at line 254 of file search_graph.cc.

10.92.3.2 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.92.3.3 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.92.3.4 delta coco::delta_node::get_delta (unsigned int *i*) [inline]

A call to this method returns a copy of the ith delta.

Definition at line 395 of file search_node.hpp.

10.92.3.5 const delta & coco::delta_node::get_delta (unsigned int *i*) const [inline]

A call to this method returns a const reference to the ith delta.

Definition at line 411 of file search_node.hpp.

10.92.3.6 delta_id coco::coco::delta_node::get_delta_id (unsigned int *i*) const [inline]

A call to this method returns the delta id of the ith delta.

Definition at line 242 of file search_graph.cc.

10.92.3.7 template<class _SeqContainer > void coco::coco::delta_node::get_deltas (_SeqContainer & _c) [inline]

This method extracts all deltas from the delta node and adds it to the end of the container passed.

Definition at line 260 of file search_graph.cc.

10.92.3.8 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.92.3.9 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.92.3.10 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.92.3.11 bool coco::coco::delta_node::is_delta ( ) const [inline, virtual]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a delta_node it returns `true`.

Reimplemented from coco::coco::search_node.

Definition at line 236 of file search_graph.cc.

10.92.3.12 void coco::coco::search_node::keep (const annotation & _an) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation _an.

Definition at line 173 of file search_graph.cc.

10.92.3.13 void coco::coco::search_node::keep (const std::vector< annotation > & _anv) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in _anv.

Definition at line 177 of file search_graph.cc.

10.92.3.14 unsigned int coco::coco::delta_node::n_deltas ( ) const [inline]

This method returns the number of deltas stored in this delta node.

Definition at line 239 of file search_graph.cc.

10.92.3.15 delta_node & coco::delta_node::operator= (const delta_node & __w) [inline]

Standard Assignment Operator

Definition at line 198 of file search_node.hpp.

10.92.3.16 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.92.3.17 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.92.3.18 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.92.3.19 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation _an.

Definition at line 82 of file search_node.hpp.

10.92.3.20 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

Definition at line 93 of file search_node.hpp.

10.92.4 Friends And Related Function Documentation

10.92.4.1 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.92.5 Member Data Documentation

10.92.5.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.92.5.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.92.5.3 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.92.5.4 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.92.5.5 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.92.5.6 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.92.5.7 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

The documentation for this class was generated from the following files:

- search_node.h
- search_node.hpp

10.93.1 Detailed Description

This is a class of nodes stored in the search graph. It represents a delta node, i.e., a node which only stores the changes with respect to the parent model.

See also

delta

10.93.2 Constructor & Destructor Documentation

10.93.2.1 coco::delta_node::delta_node (const search_node_id & *_i*, const vdbl::userid & *_dui*, std::vector< delta_id > & *__d*, gptr< search_node > & *_gm*, gptr< vdbl::database > & *_db*, search_node_relation *_snr* = snr_reduction) [inline]

This constructor generates a new delta node (a reduction node by default) with search_node_id i and search_node_relation ___snr holding the delta ids stored in ___d. The parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively.

Definition at line 220 of file search_node.h.

10.93.2.2 virtual coco::delta_node::~delta_node ( ) [inline, virtual]

Standard Destructor

Definition at line 228 of file search_node.h.

10.93.3 Member Function Documentation

10.93.3.1 template<class _Iterator > void coco::delta_node::add_deltas (_Iterator *_f*, _Iterator *_l*) [inline]

This method inserts all deltas in the collection of delta ids, which starts at iterator _f and ends before iterator _l to the list of delta ids in this delta node.

Definition at line 254 of file search_node.h.

10.93.3.2 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.93.3.3 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.93.3.4 delta coco::delta_node::get_delta (unsigned int *i*)

A call to this method returns a copy of the ith delta.

10.93.3.5 const delta& coco::delta_node::get_delta (unsigned int *i*) const

A call to this method returns a const reference to the ith delta.

10.93.3.6 delta_id coco::delta_node::get_delta_id (unsigned int *i*) const [inline]

A call to this method returns the delta id of the ith delta.

Definition at line 242 of file search_node.h.

10.93.3.7 template<class _SeqContainer > void coco::delta_node::get_deltas (_SeqContainer & _c) [inline]

This method extracts all deltas from the delta node and adds it to the end of the container passed.

Definition at line 260 of file search_node.h.

10.93.3.8 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.93.3.9 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.93.3.10 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.93.3.11 bool coco::delta_node::is_delta ( ) const [inline, virtual]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a delta_node it returns `true`.

Reimplemented from coco::coco::search_node.

Definition at line 236 of file search_node.h.

10.93.3.12 void coco::coco::search_node::keep (const annotation & _an) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation _an.

Definition at line 173 of file search_graph.cc.

10.93.3.13 void coco::coco::search_node::keep (const std::vector< annotation > & _anv) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in _anv.

Definition at line 177 of file search_graph.cc.

10.93.3.14 unsigned int coco::delta_node::n_deltas ( ) const [inline]

This method returns the number of deltas stored in this delta node.

Definition at line 239 of file search_node.h.

10.93.3.15 delta_node& coco::delta_node::operator= (const delta_node & __w)

Standard Assignment Operator

10.93.3.16 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.93.3.17 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.93.3.18 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.93.3.19 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation _an.

Definition at line 82 of file search_node.hpp.

10.93.3.20 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

Definition at line 93 of file search_node.hpp.

10.93.4 Friends And Related Function Documentation

10.93.4.1 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.93.5 Member Data Documentation

10.93.5.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.93.5.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.93.5.3 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.93.5.4 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.93.5.5 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.93.5.6 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.93.5.7 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

10.94.1 Detailed Description

This class is a cached backward evaluator performing a gradient evaluation with available partial derivative information.

10.94.2 Member Typedef Documentation

10.94.2.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.94.2.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.94.2.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.94.3 Constructor & Destructor Documentation

10.94.3.1 coco::der_eval::der_eval (std::vector< std::vector< double > > & __der_data, variable_indicator & __v, const model & __m, std::vector< std::vector< double > > * __d, std::vector< double > & __grad) [inline]

Constructor: __der_data contains the partial derivative information, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, and __d the cache (may be NULL). Eventually, __grad is a reference to the result vector. This vector must have the correct length and has to be initialized with zero, since all components are actually computed by adding to the components of __grad.

Definition at line 1093 of file der_evaluator.h.

10.94.3.2 coco::der_eval::der_eval (const der_eval & __d) [inline]

Standard Copy Constructor

Definition at line 1107 of file der_evaluator.h.

10.94.3.3 coco::der_eval::~der_eval ( ) [inline]

Standard Destructor

Definition at line 1110 of file der_evaluator.h.

10.94.4 Member Function Documentation

10.94.4.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.94.4.2 int coco::der_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1148 of file der_evaluator.h.

10.94.4.3 bool coco::der_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< der_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1241 of file der_evaluator.h.

10.94.4.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.94.4.5 void coco::der_eval::cleanup (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1197 of file der_evaluator.h.

10.94.4.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.94.4.7 void coco::der_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< der_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1142 of file der_evaluator.h.

10.94.4.8 bool coco::der_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the gradient for this node is already available.

Reimplemented from coco::coco::cached_backward_evaluator_base< der_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1072 of file der_evaluator.h.

10.94.4.9 void coco::der_eval::new_point (std::vector< std::vector< double > > & __der_data, const variable_indicator & __v) [inline]

This method changes the evaluation point to new derivative data ___der. The parameter ___v specifies which variables have changed value since the last evaluation.

Definition at line 1115 of file der_evaluator.h.

10.94.4.10 void coco::der_eval::new_result (std::vector< double > & __grad) [inline]

This method changes the result vector to ___grad.

Definition at line 1123 of file der_evaluator.h.

10.94.4.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.94.4.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.94.4.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.94.4.14 void coco::der_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1208 of file der_evaluator.h.

10.94.4.15 void coco::der_eval::set_mult (double scal) [inline]

This method causes the gradient to be multiplied by `scal`.

Definition at line 1129 of file der_evaluator.h.

10.94.4.16 expression_const_walker coco::der_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 1136 of file der_evaluator.h.

10.94.4.17 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.94.4.18 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.94.4.19 int coco::der_eval::update (const bool & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1215 of file der_evaluator.h.

10.94.4.20 int coco::der_eval::update (const expression_node & *__data*, const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1222 of file der_evaluator.h.

10.94.4.21 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.94.4.22 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.94.4.23 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.94.4.24 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

The documentation for this class was generated from the following file:

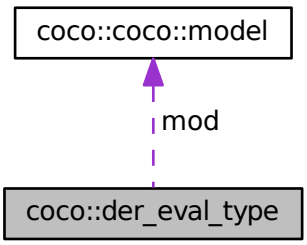
- der_evaluator.h

10.95 coco::der_eval_type Struct Reference

Visitor data for der_eval.

```
#include <der_evaluator.h>
```

Collaboration diagram for coco::der_eval_type:



Public Attributes

- std::vector< std::vector < double > > * d_data
- std::vector< std::vector < double > > * d_cache
- std::vector< double > * grad_vec
- const model * mod
- double mult
- double mult_trans
- unsigned int child_n

10.95.1 Detailed Description

This class is the visitor data type for the der_eval evaluator.

10.95.2 Member Data Documentation

10.95.2.1 unsigned int coco::der_eval_type::child_n

children counter

Definition at line 1051 of file der_evaluator.h.

10.96.1 Detailed Description

The detect_0chain_visitor is used to find 0-chains, i.e. univariate functions within the DAG.

10.96.2 Member Typedef Documentation

10.96.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.96.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.96.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.96.3 Constructor & Destructor Documentation

10.96.3.1 coco::model::detect_0chain_visitor::detect_0chain_visitor (std::vector< unsigned int > & __t, std::vector< unsigned int > & __d, std::vector< unsigned int > & __nn, unsigned int & d) [inline]

Constructor, which initializes the vector of types with __t, the vector of depths with __d, the vector of chain bases with __nn, and the counter with d.

Definition at line 2334 of file model.hpp.

10.96.3.2 coco::model::detect_0chain_visitor::detect_0chain_visitor (const detect_0chain_visitor & __x) [inline]

Standard Copy Constructor

Definition at line 2347 of file model.hpp.

10.96.3.3 coco::model::detect_0chain_visitor::~detect_0chain_visitor ( ) [inline]

Standard Destructor

Definition at line 2351 of file model.hpp.

10.96.4 Member Function Documentation

10.96.4.1 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.96.4.2 void coco::model::detect_0chain_visitor::calculate (const expression_node & __data) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2383 of file model.hpp.

10.96.4.3 std::pair<unsigned int,unsigned int> coco::model::detect_0chain_visitor::calculate_value (bool *eval_all*) [inline, virtual]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Reimplemented from coco::coco::cached_forward_evaluator_base< model::detect_0chain_visitor_st, expression-_node, std::pair< unsigned int, unsigned int >, model::const_walker >.

Definition at line 2412 of file model.hpp.

10.96.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.96.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.96.4.6 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.96.4.7 void coco::model::detect_0chain_visitor::initialize ( ) [inline, virtual]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Reimplemented from coco::coco::cached_forward_evaluator_base< model::detect_0chain_visitor_st, expression-_node, std::pair< unsigned int, unsigned int >, model::const_walker >.

Definition at line 2356 of file model.hpp.

10.96.4.8 int coco::model::detect_0chain_visitor::initialize (const expression_node & *__data*) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2365 of file model.hpp.

10.96.4.9 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.96.4.10 bool coco::model::detect_0chain_visitor::is_cached (const expression_node & *__data*) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2358 of file model.hpp.

10.96.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.96.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.96.4.13 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.96.4.14 void coco::model::detect_0chain_visitor::retrieve_from_cache (const expression_node & __data) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2361 of file model.hpp.

10.96.4.15 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.96.4.16 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The ___data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.96.4.17 int coco::model::detect_0chain_visitor::update (const std::pair< unsigned int, unsigned int > & __rval) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2389 of file model.hpp.

10.96.4.18 int coco::model::detect_0chain_visitor::update (const expression_node & __data, const std::pair< unsigned int, unsigned int > & __rval) [inline]

This is a method which has to be defined for a cached forward evaluator.

See also

cached_forward_evaluator_base.

Definition at line 2391 of file model.hpp.

10.96.4.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.96.4.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.96.4.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.96.4.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.97 coco::model::detect_0chain_visitor_st Struct Reference

`#include <model.hpp>`

Public Attributes

- std::pair< unsigned int, unsigned int > r
- unsigned int * f
- std::vector< unsigned int > * t

- std::vector< unsigned int > * d
- std::vector< unsigned int > * nn
- bool new_number

10.97.1 Detailed Description

This struct is the visitor data of the model::detect_0chain_visitor.

10.97.2 Member Data Documentation

10.97.2.1 std::vector<unsigned int>* coco::model::detect_0chain_visitor_st::d

vector of node depths

Definition at line 2313 of file model.hpp.

10.97.2.2 unsigned int* coco::model::detect_0chain_visitor_st::f

counter

Definition at line 2311 of file model.hpp.

10.97.2.3 bool coco::model::detect_0chain_visitor_st::new_number

is this a new 0-chain?

Definition at line 2315 of file model.hpp.

10.97.2.4 std::vector<unsigned int>* coco::model::detect_0chain_visitor_st::nn

vector of 0-chain bases

Definition at line 2314 of file model.hpp.

10.97.2.5 std::pair<unsigned int,unsigned int> coco::model::detect_0chain_visitor_st::r

return value (node number, depth)

Definition at line 2310 of file model.hpp.

10.97.2.6 std::vector<unsigned int>* coco::model::detect_0chain_visitor_st::t

vector of node types

Definition at line 2312 of file model.hpp.

The documentation for this struct was generated from the following file:

10.98.1 Member Typedef Documentation

10.98.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.98.1.2 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.98.2 Constructor & Destructor Documentation

10.98.2.1 coco::dfunc_eval::dfunc_eval (const _T & __x, const variable_indicator & __v, const model & __m, std::vector< retval > * __c) [inline]

Definition at line 135 of file dfunc_evaluator.h.

10.98.2.2 coco::dfunc_eval::dfunc_eval (const dfunc_eval & __v) [inline]

Definition at line 146 of file dfunc_evaluator.h.

10.98.2.3 coco::dfunc_eval::~dfunc_eval ( ) [inline]

Definition at line 148 of file dfunc_evaluator.h.

10.98.3 Member Function Documentation

10.98.3.1 void coco::dfunc_eval::calculate (const expression_node & __data) [inline]

Definition at line 238 of file dfunc_evaluator.h.

10.98.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.98.3.3 retval coco::dfunc_eval::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< dfunc_eval_type< _T, DN >, expression_node, dfunc_eval_rettype< _T, DN >, expression_const_walker >.

Definition at line 655 of file dfunc_evaluator.h.

10.98.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.98.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.98.3.6 void coco::dfunc_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< dfunc_eval_type< _T, DN >, expression_node, dfunc_eval_rettype< _T, DN >, expression_const_walker >.

Definition at line 160 of file dfunc_evaluator.h.

10.98.3.7 int coco::dfunc_eval::initialize (const expression_node & *__data*) [inline]

Definition at line 162 of file dfunc_evaluator.h.

10.98.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.98.3.9 bool coco::dfunc_eval::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< dfunc_eval_type< _T, DN >, expression_node, dfunc_eval_rettype< _T, DN >, expression_const_walker >.

Definition at line 80 of file dfunc_evaluator.h.

10.98.3.10 void coco::dfunc_eval::new_point (const _T & *__x*, const variable_indicator & *__v*) [inline]

Definition at line 154 of file dfunc_evaluator.h.

10.98.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.98.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.98.3.13 void coco::dfunc_eval::retrieve_from_cache (const expression_node & *__data*) [inline]

Definition at line 249 of file dfunc_evaluator.h.

10.98.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.98.3.15 expression_const_walker coco::dfunc_eval::short_cut_to (const expression_node & *__data*) [inline]

Definition at line 150 of file dfunc_evaluator.h.

10.98.3.16 int coco::dfunc_eval::update (const retval & *__rval*) [inline]

Definition at line 254 of file dfunc_evaluator.h.

10.98.3.17 int coco::dfunc_eval::update (const expression_node & *__data*, const retval & *__rval*) [inline]

Definition at line 260 of file dfunc_evaluator.h.

10.98.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.98.3.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.98.3.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.98.3.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.98.3.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.98.3.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

- bool drop_columns (vdbl::standard_table &stable)
- const std::string & name () const

Protected Member Functions

- template<class _CI >
  bool _init_column (vdbl::standard_table &stable, const std::string &colname, const _CI &c)
- template<class _CI >
  bool _init_column (vdbl::standard_table &stable, const char *colname, const _CI &c)
- bool _drop_columns (vdbl::standard_table &stable)
- search_node_relation parent_relation (const work_node &wn) const
- search_node_id node_id (const work_node &wn) const

10.101.1 Detailed Description

This class is a work node computation hook (see work_node_comp_hook), which calculates the diameter and the minimal width of the work node (variables only) and keeps it in columns “diameter” and “min width”.

10.101.2 Constructor & Destructor Documentation

10.101.2.1 coco::diameter_comp_hook::diameter_comp_hook ( ) [inline]

Standard Constructor

Definition at line 46 of file diameter_hook.h.

10.101.2.2 virtual coco::diameter_comp_hook::~diameter_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 49 of file diameter_hook.h.

10.101.3 Member Function Documentation

10.101.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in ___managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.101.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 238 of file comp_hook.h.

10.101.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 135 of file comp_hook.h.

10.101.3.4 bool coco::diameter_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the column "diameter" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 83 of file diameter_hook.h.

10.101.3.5 bool coco::diameter_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "diameter" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 76 of file diameter_hook.h.

10.101.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.101.3.7 diameter_comp_hook* coco::diameter_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 52 of file diameter_hook.h.

10.101.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.101.3.9 void coco::diameter_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *a* = `NULL`, std::list< certificate > * *b* = `NULL`) const [inline, virtual]

The evaluation operator of this computation hook. It stores the log-volume of the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 56 of file diameter_hook.h.

10.101.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

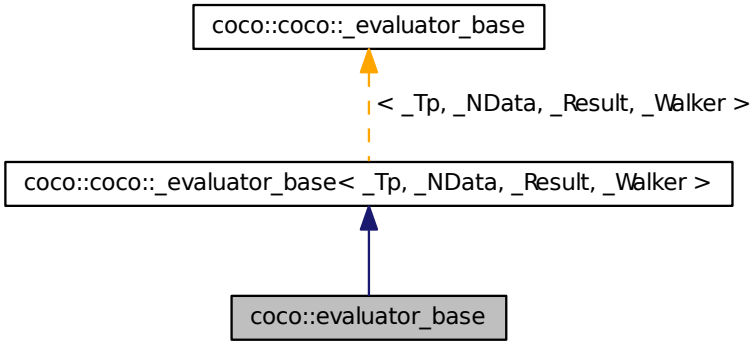
10.105 coco::evaluator_base Class Reference

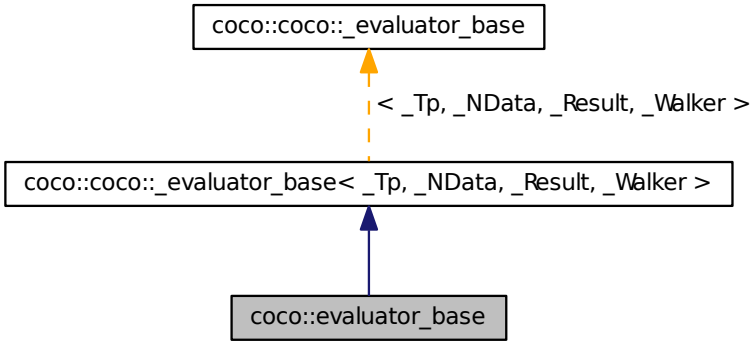
Base class of all (non-caching) evaluators.

`#include <evaluator.h>`

Inheritance diagram for coco::evaluator_base:



Collaboration diagram for coco::evaluator_base:



Public Types

- typedef _Base::node_data_type node_data_type
- typedef _Base::return_value return_value
- typedef _Base::const_walker const_walker
- typedef _Tp data_type

Public Member Functions

- virtual int preorder (const node_data_type &__data)
- virtual const_walker short_cut_to (const node_data_type &__data)
- virtual return_value vvalue ()
- virtual return_value value ()
- virtual int vcollect (const return_value &__cresult)
- virtual int collect (const node_data_type &__data, const return_value &__cresult)
- virtual void postorder (const node_data_type &__data)

Protected Attributes

- _Tp eval_data

10.105.1 Detailed Description

This class is the base class of all non-caching evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on _evaluator_base.

10.105.2 Member Typedef Documentation

10.105.2.1 typedef _Base::const_walker coco::evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 390 of file evaluator.h.

10.105.2.2 typedef _Tp coco::coco::_evaluator_base::data_type [inherited]

The data_type specifies the type of the internal data of the evaluator.

Definition at line 306 of file search_graph.cc.

10.105.2.3 typedef _Base::node_data_type coco::evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 386 of file evaluator.h.

10.105.2.4 typedef _Base::return_value coco::evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 388 of file evaluator.h.

10.105.3 Member Function Documentation

10.105.3.1 virtual int coco::coco::_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 360 of file search_graph.cc.

10.105.3.2 virtual void coco::coco::_evaluator_base::postorder (const node_data_type & *__data*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 365 of file search_graph.cc.

10.105.3.3 virtual int coco::evaluator_base::preorder (const node_data_type & __data) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 401 of file evaluator.h.

10.105.3.4 virtual const_walker coco::evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the const_walker returned is the target of the short-cut.

Definition at line 405 of file evaluator.h.

10.105.3.5 virtual return_value coco::coco::_evaluator_base::value ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 337 of file search_graph.cc.

10.105.3.6 virtual int coco::coco::_evaluator_base::vcollect (const return_value & __cresult) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 349 of file search_graph.cc.

10.105.3.7 virtual return_value coco::coco::_evaluator_base::vvalue ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 333 of file search_graph.cc.

10.105.4 Member Data Documentation

10.105.4.1 _Tp coco::coco::_evaluator_base::eval_data [protected, inherited]

The internal data of the evaluator

Definition at line 317 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.106 coco::coco::evaluator_base Class Reference

Base class of all (non-caching) evaluators.

10.106.1 Detailed Description

This class is the base class of all non-caching evaluators. Basically, it is a visitor to expression_node nodes in a DAG, based on _evaluator_base.

10.106.2 Member Typedef Documentation

10.106.2.1 typedef _Base::const_walker coco::coco::evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::backward_evaluator_base, coco::backward_evaluator_base, coco::coco::forward_evaluator_base, and coco::forward_evaluator_base.

Definition at line 391 of file search_graph.cc.

10.106.2.2 typedef _Tp coco::coco::_evaluator_base::data_type [inherited]

The data_type specifies the type of the internal data of the evaluator.

Definition at line 306 of file search_graph.cc.

10.106.2.3 typedef _Base::node_data_type coco::coco::evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::backward_evaluator_base, coco::backward_evaluator_base, coco::coco::forward_evaluator_base, and coco::forward_evaluator_base.

Definition at line 387 of file search_graph.cc.

10.106.2.4 typedef _Base::return_value coco::coco::evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::_evaluator_base< _Tp, _NData, _Result, _Walker >.

Reimplemented in coco::coco::backward_evaluator_base, coco::backward_evaluator_base, coco::coco::forward_evaluator_base, and coco::forward_evaluator_base.

Definition at line 389 of file search_graph.cc.

10.106.3 Member Function Documentation

10.106.3.1 virtual int coco::coco::_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 360 of file search_graph.cc.

10.106.3.2 virtual void coco::coco::_evaluator_base::postorder (const node_data_type & *__data*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited.

Definition at line 365 of file search_graph.cc.

10.106.3.3 virtual int coco::coco::evaluator_base::preorder (const node_data_type & *__data*) [inline, virtual]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 402 of file search_graph.cc.

10.106.3.4 virtual const_walker coco::coco::evaluator_base::short_cut_to (const node_data_type & *__data*) [inline, virtual]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 406 of file search_graph.cc.

10.106.3.5 virtual return_value coco::coco::_evaluator_base::value ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value.

Definition at line 337 of file search_graph.cc.

10.106.3.6 virtual int coco::coco::_evaluator_base::vcollect (const return_value & *__cresult*) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect-:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 349 of file search_graph.cc.

10.106.3.7 virtual return_value coco::coco::_evaluator_base::vvalue ( ) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value.

Definition at line 333 of file search_graph.cc.

10.106.4 Member Data Documentation

10.106.4.1 _Tp coco::coco::_evaluator_base::eval_data [protected, inherited]

The internal data of the evaluator

Definition at line 317 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.107 coco::coco::expression_node Class Reference

The base class for a node in the expression DAGs.

  this node depends on which variables?
- evaluator_v * ev

Friends

- std::ostream & operator<< (std::ostream &o, const expression_node &__x)

10.107.1 Detailed Description

This class is the base class for all nodes in the expression DAGs used to specify the optimization problems to be solved.

10.107.2 Constructor & Destructor Documentation

10.107.2.1 coco::coco::expression_node::expression_node ( ) [inline]

The Standard Constructor

Definition at line 519 of file search_graph.cc.

10.107.2.2 coco::coco::expression_node::expression_node (int *et*, int *nn*) [inline]

Constructor, which builds a node of operator type `et` having node number `nn`.

Definition at line 526 of file search_graph.cc.

10.107.2.3 coco::coco::expression_node::expression_node (const expression_node & *__x*) [inline]

Standard Copy Constructor

Definition at line 533 of file search_graph.cc.

10.107.2.4 virtual coco::coco::expression_node::~expression_node ( ) [inline, virtual]

Standard Destructor

Definition at line 541 of file search_graph.cc.

10.107.3 Member Function Documentation

10.107.3.1 void coco::coco::expression_node::add_is_var (unsigned int *idx*) [inline]

The add_is_var method is used to add the variable number `idx` to the list of variables, which are represented by this node.

Definition at line 620 of file search_graph.cc.

10.107.3.2 virtual interval coco::coco::expression_node::cp_evaluate (int *argnum,* int *idx,* const std::vector< interval > & *node_range,* const variable_indicator & *v_i,* interval *fold,* interval *fupd,* std::vector< interval > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 663 of file search_graph.cc.

10.107.3.3 virtual double coco::coco::expression_node::f_evaluate (int *argnum,* int *idx,* const std::vector< double > & *x,* const variable_indicator & *v_i,* double *fold,* double *fupd,* std::vector< double > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 655 of file search_graph.cc.

10.107.3.4 virtual interval coco::coco::expression_node::i_evaluate (int *argnum,* int *idx,* const std::vector< interval > & *x,* const variable_indicator & *v_i,* interval *fold,* interval *fupd,* std::vector< interval > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 659 of file search_graph.cc.

10.107.3.5 bool coco::expression_node::is (unsigned int *__tp*) const

The method `is` is used to determine, whether the expression represented by this node has a certain type specified by `__tp`. For `__tp` one of the `ex_..` values or a logical combination of them can be used.

Definition at line 39 of file expression.cc.

10.107.3.6 void coco::coco::expression_node::merge (const expression_node & *__s*) [inline]

This method merges the node `__s` with this node. It is used mainly in the simplifier.

Definition at line 580 of file search_graph.cc.

10.107.3.7 bool coco::coco::expression_node::operator< (const expression_node & *__x*) const [inline]

This is the order operator for expression nodes.

This function compares two nodes' node numbers.

Definition at line 279 of file expression.hpp.

10.107.3.8 expression_node& coco::coco::expression_node::operator= (const expression_node & __x) [inline]

Standard Assignment Operator

Definition at line 549 of file search_graph.cc.

10.107.3.9 void coco::coco::expression_node::rm_is_var (unsigned int *idx*) [inline]

The add_is_var method is used to remove the variable number `idx` from the list of variables, which are represented by this node.

Definition at line 628 of file search_graph.cc.

10.107.3.10 void coco::coco::expression_node::set_bounds (rhs_t __i) [inline]

This method sets the node's restriction to the rhs_t `__i`.

Definition at line 593 of file search_graph.cc.

10.107.3.11 void coco::coco::expression_node::set_bounds (double __d = 0.) [inline]

This method sets the node's bounds to the equality restriction "== `__d`".

Definition at line 600 of file search_graph.cc.

10.107.3.12 void coco::coco::expression_node::set_bounds (int __i) [inline]

This method sets the node's bounds to the restriction "in `__i`".

Definition at line 606 of file search_graph.cc.

10.107.3.13 void coco::coco::expression_node::set_bounds (double *lo*, double *up*) [inline]

This method sets the node's bounds to the restriction "in `[lo, up]`".

Definition at line 613 of file search_graph.cc.

10.107.3.14 const variable_indicator& coco::coco::expression_node::var_indicator ( ) const [inline]

This method returns the variable indicator of this node.

Definition at line 650 of file search_graph.cc.

10.107.4 Friends And Related Function Documentation

10.107.4.1 std::ostream& operator<< (std::ostream & *o*, const expression_node & __x) [friend]

10.107.5 Member Data Documentation

10.108.1 Detailed Description

This class is the base class for all nodes in the expression DAGs used to specify the optimization problems to be solved.

10.108.2 Constructor & Destructor Documentation

10.108.2.1 coco::expression_node::expression_node ( ) [inline]

The Standard Constructor

Definition at line 519 of file expression.h.

10.108.2.2 coco::expression_node::expression_node (int *et*, int *nn*) [inline]

Constructor, which builds a node of operator type `et` having node number `nn`.

Definition at line 526 of file expression.h.

10.108.2.3 coco::expression_node::expression_node (const expression_node & *__x*) [inline]

Standard Copy Constructor

Definition at line 533 of file expression.h.

10.108.2.4 virtual coco::expression_node::~expression_node ( ) [inline, virtual]

Standard Destructor

Definition at line 541 of file expression.h.

10.108.3 Member Function Documentation

10.108.3.1 void coco::expression_node::add_is_var (unsigned int *idx*) [inline]

The add_is_var method is used to add the variable number `idx` to the list of variables, which are represented by this node.

Definition at line 620 of file expression.h.

10.108.3.2 virtual interval coco::expression_node::cp_evaluate (int *argnum*, int *idx*, const std::vector< interval > & *node_range*, const variable_indicator & *v_i*, interval *fold*, interval *fupd*, std::vector< interval > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 663 of file expression.h.

10.108.3.3 virtual double coco::expression_node::f_evaluate (int *argnum*, int *idx*, const std::vector< double > & *x*, const variable_indicator & *v_i*, double *fold*, double *fupd*, std::vector< double > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 655 of file expression.h.

10.108.3.4 virtual interval coco::expression_node::i_evaluate (int *argnum*, int *idx*, const std::vector< interval > & *x*, const variable_indicator & *v_i*, interval *fold*, interval *fupd*, std::vector< interval > * *cache_data*) const [inline, virtual]

This is an extra evaluation routine, which needs to be overloaded by a user defined node (with operator_type > 0).

Definition at line 659 of file expression.h.

10.108.3.5 bool coco::expression_node::is (unsigned int *__tp*) const

The method `is` is used to determine, whether the expression represented by this node has a certain type specified by `__tp`. For `__tp` one of the `ex_..` values or a logical combination of them can be used.

10.108.3.6 void coco::expression_node::merge (const expression_node & *__s*) [inline]

This method merges the node `__s` with this node. It is used mainly in the simplifier.

Definition at line 580 of file expression.h.

10.108.3.7 bool coco::expression_node::operator< (const expression_node & *__x*) const

This is the order operator for expression nodes.

10.108.3.8 expression_node& coco::expression_node::operator= (const expression_node & *__x*) [inline]

Standard Assignment Operator

Definition at line 549 of file expression.h.

10.108.3.9 void coco::expression_node::rm_is_var (unsigned int *idx*) [inline]

The add_is_var method is used to remove the variable number `idx` from the list of variables, which are represented by this node.

Definition at line 628 of file expression.h.

10.108.3.10 void coco::expression_node::set_bounds (rhs_t *__i*) [inline]

This method sets the node's restriction to the rhs_t `__i`.

Definition at line 593 of file expression.h.

10.108.3.11 void coco::expression_node::set_bounds (double *__d* = `0.`) [inline]

This method sets the node's bounds to the equality restriction "== `__d`".

Definition at line 600 of file expression.h.

10.108.3.12 void coco::expression_node::set_bounds (int *__i*) [inline]

This method sets the node's bounds to the restriction "in `__i`".

Definition at line 606 of file expression.h.

10.108.3.13 void coco::expression_node::set_bounds (double *lo*, double *up*) [inline]

This method sets the node's bounds to the restriction "in [lo, up]".

Definition at line 613 of file expression.h.

10.108.3.14 const variable_indicator& coco::expression_node::var_indicator ( ) const [inline]

This method returns the variable indicator of this node.

Definition at line 650 of file expression.h.

10.108.4 Friends And Related Function Documentation

10.108.4.1 std::ostream& operator<< (std::ostream & *o*, const expression_node & *__x*) [friend]

Definition at line 208 of file expression.cc.

10.108.5 Member Data Documentation

10.108.5.1 std::vector<double> coco::expression_node::coeffs

Definition at line 490 of file expression.h.

10.108.5.2 evaluator_v* coco::expression_node::ev

optional evaluators used instead of tree walks NULL means no evaluators, map if some or all are defined. This is for recursive_cached_walk.

Definition at line 505 of file expression.h.

10.108.5.3 rhs_t coco::expression_node::f_bounds

Definition at line 494 of file expression.h.

10.108.5.4 unsigned short coco::expression_node::is_var

Definition at line 496 of file expression.h.

10.108.5.5 unsigned int coco::expression_node::n_children

Definition at line 486 of file expression.h.

10.108.5.6 unsigned int coco::expression_node::n_parents

Definition at line 486 of file expression.h.

10.108.5.7 unsigned int coco::expression_node::node_num

Definition at line 475 of file expression.h.

10.108.5.8 int coco::expression_node::operator_type

this is a number describing the operation. negative numbers describe standard operations as defined above. the positive numbers describe other operations like elementary functions (exp, pow, sin,...) or more complicated functions like linear or general quadratic terms, user-defined functions, piecewise linear approximations,...

Definition at line 477 of file expression.h.

10.108.5.9 basic_alltype coco::expression_node::params

Definition at line 492 of file expression.h.

10.108.5.10 semantics coco::expression_node::sem

additional semantics information like integer (y/n), stochastic (y/n), karush-john (y/n) convexity,...

Definition at line 499 of file expression.h.

10.108.5.11 variable_indicator coco::expression_node::v_i

Definition at line 503 of file expression.h.

10.108.5.12 std::vector<unsigned int> coco::expression_node::var_idx

Definition at line 497 of file expression.h.

The documentation for this class was generated from the following file:

- expression.h

10.109 coco::expression_print_visitor Class Reference

`#include <expression.hpp>`

Public Member Functions

- expression_print_visitor (std::vector< bool > &__p, std::ostream &__o=std::cout)
- expression_print_visitor (const expression_print_visitor &__p)
- ~expression_print_visitor ()

- bool preorder (const expression_node &r)
- int vvalue ()
- int value ()
- void collect (const expression_node &r, int __r)

10.109.1 Detailed Description

This class is a visitor to expression_node nodes in a DAG, which can be used to print the DAG in .dag format.

10.109.2 Constructor & Destructor Documentation

10.109.2.1 coco::expression_print_visitor::expression_print_visitor (std::vector< bool > & __p, std::ostream & __o = std::cout) [inline]

Constructor, which initializes printed from __p and sets the ostream to __o (default is cout).

Definition at line 302 of file expression.hpp.

10.109.2.2 coco::expression_print_visitor::expression_print_visitor (const expression_print_visitor & __p) [inline]

Standard Copy Constructor

Definition at line 306 of file expression.hpp.

10.109.2.3 coco::expression_print_visitor::~expression_print_visitor ( ) [inline]

Standard Destructor

Definition at line 309 of file expression.hpp.

10.109.3 Member Function Documentation

10.109.3.1 void coco::expression_print_visitor::collect (const expression_node & r, int __r) [inline]

This function is needed by a VGTL preorder visitor.

Definition at line 330 of file expression.hpp.

10.109.3.2 bool coco::expression_print_visitor::preorder (const expression_node & r) [inline]

This function is needed by a VGTL preorder visitor.

Definition at line 313 of file expression.hpp.

10.109.3.3 int coco::expression_print_visitor::value ( ) [inline]

This function is needed by a VGTL preorder visitor.

Definition at line 329 of file expression.hpp.

10.109.3.4 int coco::expression_print_visitor::vvalue ( ) [inline]

This function is needed by a VGTL preorder visitor.

Definition at line 328 of file expression.hpp.

- virtual return_value calculate_value (bool eval_all)
- virtual int preorder (const node_data_type &__data)
- virtual const_walker short_cut_to (const node_data_type &__data)

10.111.1 Detailed Description

This class is the base class of all non-caching forward evaluators. Basically, it is a visitor to expression_-node nodes in a DAG, based on evaluator_base.

10.111.2 Member Typedef Documentation

10.111.2.1 typedef _Base::const_walker coco::forward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 489 of file evaluator.h.

10.111.2.2 typedef _Base::node_data_type coco::forward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 485 of file evaluator.h.

10.111.2.3 typedef _Base::return_value coco::forward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 487 of file evaluator.h.

10.111.3 Member Function Documentation

10.111.3.1 virtual void coco::forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 547 of file evaluator.h.

10.111.3.2 virtual return_value coco::forward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Definition at line 577 of file evaluator.h.

10.111.3.3 virtual void coco::forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 551 of file evaluator.h.

10.111.3.4 int coco::forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 506 of file evaluator.h.

10.111.3.5 virtual void coco::forward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 532 of file evaluator.h.

10.111.3.6 virtual int coco::forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 543 of file evaluator.h.

10.111.3.7 void coco::forward_evaluator_base::postorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 500 of file evaluator.h.

10.111.3.8 virtual int coco::coco::evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 402 of file search_graph.cc.

10.111.3.9 int coco::forward_evaluator_base::preorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It is translated into a call to initialize.

Definition at line 495 of file evaluator.h.

10.111.3.10 virtual const_walker coco::coco::evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 406 of file search_graph.cc.

10.111.3.11 virtual int coco::forward_evaluator_base::update (const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 561 of file evaluator.h.

10.111.3.12 virtual int coco::forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 572 of file evaluator.h.

10.111.3.13 return_value coco::forward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 518 of file evaluator.h.

10.111.3.14 int coco::forward_evaluator_base::vcollect (const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 512 of file evaluator.h.

10.111.3.15 void coco::forward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 527 of file evaluator.h.

10.111.3.16 return_value coco::forward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 523 of file evaluator.h.

The documentation for this class was generated from the following file:

- evaluator.h

10.112.1 Detailed Description

This class is the base class of all non-caching forward evaluators. Basically, it is a visitor to expression_-node nodes in a DAG, based on evaluator_base.

10.112.2 Member Typedef Documentation

10.112.2.1 typedef _Base::const_walker coco::coco::forward_evaluator_base::const_walker

This is the type of the walker, which is used for the short-cuts.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 490 of file search_graph.cc.

10.112.2.2 typedef _Base::node_data_type coco::coco::forward_evaluator_base::node_data_type

The node_data_type is the datatype of the nodes of the graph.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 486 of file search_graph.cc.

10.112.2.3 typedef _Base::return_value coco::coco::forward_evaluator_base::return_value

This type is the result type of the evaluator.

Reimplemented from coco::coco::evaluator_base< _Tp, _NData, _Result, _Walker >.

Definition at line 488 of file search_graph.cc.

10.112.3 Member Function Documentation

10.112.3.1 virtual void coco::coco::forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 548 of file search_graph.cc.

10.112.3.2 virtual return_value coco::coco::forward_evaluator_base::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Definition at line 578 of file search_graph.cc.

10.112.3.3 virtual void coco::coco::forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 552 of file search_graph.cc.

10.112.3.4 int coco::coco::forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 507 of file search_graph.cc.

10.112.3.5 virtual void coco::coco::forward_evaluator_base::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Definition at line 533 of file search_graph.cc.

10.112.3.6 virtual int coco::coco::forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 544 of file search_graph.cc.

10.112.3.7 void coco::coco::forward_evaluator_base::postorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 501 of file search_graph.cc.

10.112.3.8 virtual int coco::coco::evaluator_base::preorder (const node_data_type & __data) [inline, virtual, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. The return value of the method influences the further graph walk:

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 402 of file search_graph.cc.

10.112.3.9 int coco::coco::forward_evaluator_base::preorder (const node_data_type & __data) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It is translated into a call to initialize.

Definition at line 496 of file search_graph.cc.

10.112.3.10 virtual const_walker coco::coco::evaluator_base::short_cut_to (const node_data_type & __data) [inline, virtual, inherited]

The short_cut_to method is called whenever a short-cut is signalled during the graph walk, and the `const_walker` returned is the target of the short-cut.

Definition at line 406 of file search_graph.cc.

10.112.3.11 virtual int coco::coco::forward_evaluator_base::update (const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 562 of file search_graph.cc.

10.112.3.12 virtual int coco::coco::forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 573 of file search_graph.cc.

10.112.3.13 return_value coco::coco::forward_evaluator_base::value ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 519 of file search_graph.cc.

10.112.3.14 int coco::coco::forward_evaluator_base::vcollect (const return_value & *__rval*) [inline]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 513 of file search_graph.cc.

10.112.3.15 void coco::coco::forward_evaluator_base::vinit ( ) [inline]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 528 of file search_graph.cc.

10.112.3.16 return_value coco::coco::forward_evaluator_base::vvalue ( ) [inline]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 524 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.113.1 Detailed Description

This is a class of nodes stored in the search graph. It represents a full node, i.e., a node which stores a complete model not just changes to the parent model.

10.113.2 Constructor & Destructor Documentation

10.113.2.1 coco::coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > * _gm, gptr< vdbl::database > & _db, search_node_relation _snr = snr_reduction) [inline, protected]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized as empty vector.

Definition at line 292 of file search_graph.cc.

10.113.2.2 coco::coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > * _gm, gptr< vdbl::database > & _db, const std::vector< annotation > & _a, search_node_relation _snr = snr_reduction) [inline, protected]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by the parameter _a.

Definition at line 305 of file search_graph.cc.

10.113.2.3 coco::coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > & _gm, gptr< vdbl::database > & _db, search_node_relation _snr = snr_reduction) [inline]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized as empty vector.

Definition at line 320 of file search_graph.cc.

10.113.2.4 coco::coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > & _gm, gptr< vdbl::database > & _db, const std::vector< annotation > & _a, search_node_relation _snr = snr_reduction) [inline]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by the parameter _a.

Definition at line 333 of file search_graph.cc.

10.113.2.5 coco::coco::full_node::full_node (const full_node & _i) [inline]

Standard copy constructor

Definition at line 341 of file search_graph.cc.

10.113.2.6 virtual coco::coco::full_node::~full_node ( ) [inline, virtual]

Standard Destructor

Definition at line 346 of file search_graph.cc.

10.113.3 Member Function Documentation

10.113.3.1 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.113.3.2 const annotation& coco::coco::full_node::get_annotation (unsigned int *i*) const [inline]

A call to this method returns a const reference to the `i`th annotation.

Definition at line 362 of file search_graph.cc.

10.113.3.3 const std::vector<annotation>& coco::coco::full_node::get_annotations ( ) const [inline]

A call to this method returns a const reference to the whole vector of annotations.

Definition at line 367 of file search_graph.cc.

10.113.3.4 const vdbl::database* coco::coco::full_node::get_database ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 378 of file search_graph.cc.

10.113.3.5 vdbl::database* coco::coco::full_node::get_database_ptr ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 389 of file search_graph.cc.

10.113.3.6 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.113.3.7 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.113.3.8 const model* coco::coco::full_node::get_model ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Reimplemented in coco::coco::work_node, and coco::work_node.

Definition at line 372 of file search_graph.cc.

10.113.3.9 model* coco::coco::full_node::get_model_ptr ( ) const [inline]

This method returns a pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 383 of file search_graph.cc.

10.113.3.10 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.113.3.11 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.113.3.12 bool coco::coco::full_node::is_delta ( ) const [inline, virtual]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a full_node it returns `false`.

Reimplemented from coco::coco::search_node.

Definition at line 354 of file search_graph.cc.

10.113.3.13 void coco::coco::search_node::keep (const annotation & _an) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation _an.

Definition at line 173 of file search_graph.cc.

10.113.3.14 void coco::coco::search_node::keep (const std::vector< annotation > & _anv) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in _anv.

Definition at line 177 of file search_graph.cc.

10.113.3.15 unsigned int coco::coco::full_node::n_annotations ( ) const [inline]

This method returns the number of annotations stored in this full node.

Definition at line 358 of file search_graph.cc.

10.113.3.16 full_node & coco::full_node::operator= (const full_node & *__w*) [inline]

Standard Assignment Operator

Reimplemented in coco::coco::work_node, and coco::work_node.

Definition at line 208 of file search_node.hpp.

10.113.3.17 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.113.3.18 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.113.3.19 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.113.3.20 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation _an.

Definition at line 82 of file search_node.hpp.

10.113.3.21 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

Definition at line 93 of file search_node.hpp.

10.113.4 Friends And Related Function Documentation

10.113.4.1 friend class certificate_base [friend]

Definition at line 393 of file search_graph.cc.

10.113.4.2 friend class dag_delta [friend]

Definition at line 394 of file search_graph.cc.

10.113.4.3 friend class dag_undelta [friend]

Definition at line 395 of file search_graph.cc.

10.113.4.4 friend class delta_base [friend]

Definition at line 392 of file search_graph.cc.

10.113.4.5 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.113.5 Member Data Documentation

10.113.5.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.113.5.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.113.5.3 std::vector<annotation> coco::coco::full_node::_ann

This is the vector of annotations active at this full node.

Definition at line 283 of file search_graph.cc.

10.113.5.4 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.113.5.5 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.113.5.6 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.113.5.7 gptr<model>* coco::coco::full_node::_m [protected]

This is a pointer to a global pointer to the model kept in this full node.

Definition at line 279 of file search_graph.cc.

10.113.5.8 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.113.5.9 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

The documentation for this class was generated from the following files:

- search_node.h
- search_node.hpp

10.114.1 Detailed Description

This is a class of nodes stored in the search graph. It represents a full node, i.e., a node which stores a complete model not just changes to the parent model.

10.114.2 Constructor & Destructor Documentation

10.114.2.1 coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > * _gm, gptr< vdbl::database > & _db, search_node_relation _snr = snr_reduction) [inline, protected]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized as empty vector.

Definition at line 292 of file search_node.h.

10.114.2.2 coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > * _gm, gptr< vdbl::database > & _db, const std::vector< annotation > & _a, search_node_relation _snr = snr_reduction) [inline, protected]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by the parameter _a.

Definition at line 305 of file search_node.h.

10.114.2.3 coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > & _gm, gptr< vdbl::database > & _db, search_node_relation _snr = snr_reduction) [inline]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized as empty vector.

Definition at line 320 of file search_node.h.

10.114.2.4 coco::full_node::full_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __mod, gptr< search_node > & _gm, gptr< vdbl::database > & _db, const std::vector< annotation > & _a, search_node_relation _snr = snr_reduction) [inline]

This constructor generates a new full node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameter ___mod is used to specify the full model, while the parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by the parameter _a.

10.114.2.5 coco::full_node::full_node (const full_node & _i) [inline]

Standard copy constructor

Definition at line 341 of file search_node.h.

10.114.2.6 virtual coco::full_node::~full_node ( ) [inline, virtual]

Standard Destructor

Definition at line 346 of file search_node.h.

10.114.3 Member Function Documentation

10.114.3.1 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.114.3.2 const annotation& coco::full_node::get_annotation (unsigned int *i*) const [inline]

A call to this method returns a const reference to the `i`th annotation.

Definition at line 362 of file search_node.h.

10.114.3.3 const std::vector<annotation>& coco::full_node::get_annotations ( ) const [inline]

A call to this method returns a const reference to the whole vector of annotations.

Definition at line 367 of file search_node.h.

10.114.3.4 const vdbl::database* coco::full_node::get_database ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 378 of file search_node.h.

10.114.3.5 vdbl::database* coco::full_node::get_database_ptr ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 389 of file search_node.h.

10.114.3.6 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.114.3.7 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.114.3.8 const model* coco::full_node::get_model ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 372 of file search_node.h.

10.114.3.9 model* coco::full_node::get_model_ptr ( ) const [inline]

This method returns a pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 383 of file search_node.h.

10.114.3.10 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.114.3.11 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.114.3.12 bool coco::full_node::is_delta ( ) const [inline, virtual]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a full_node it returns `false`.

Reimplemented from coco::coco::search_node.

Definition at line 354 of file search_node.h.

10.114.3.13 void coco::coco::search_node::keep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation _an.

Definition at line 173 of file search_graph.cc.

10.114.3.14 void coco::coco::search_node::keep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in _anv.

Definition at line 177 of file search_graph.cc.

10.114.3.15 unsigned int coco::full_node::n_annotations ( ) const [inline]

This method returns the number of annotations stored in this full node.

Definition at line 358 of file search_node.h.

10.114.3.16 full_node& coco::full_node::operator= (const full_node & *__w*)

Standard Assignment Operator

10.114.3.17 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.114.3.18 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.114.3.19 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.114.3.20 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation _an.

Definition at line 82 of file search_node.hpp.

10.114.3.21 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

Definition at line 93 of file search_node.hpp.

10.114.4 Friends And Related Function Documentation

10.114.4.1 friend class certificate_base [friend]

Definition at line 393 of file search_node.h.

10.114.4.2 friend class dag_delta [friend]

Definition at line 394 of file search_node.h.

10.114.4.3 friend class dag_undelta [friend]

Definition at line 395 of file search_node.h.

10.114.4.4 friend class delta_base [friend]

Definition at line 392 of file search_node.h.

10.114.4.5 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.114.5 Member Data Documentation

10.114.5.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.114.5.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.114.5.3 std::vector<annotation> coco::full_node::_ann

This is the vector of annotations active at this full node.

Definition at line 283 of file search_node.h.

10.114.5.4 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.114.5.5 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.114.5.6 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.114.5.7 gptr<model>* coco::full_node::_m [protected]

This is a pointer to a global pointer to the model kept in this full node.

Definition at line 279 of file search_node.h.

10.114.5.8 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.114.5.9 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

The documentation for this class was generated from the following file:

- search_node.h

10.115 coco::func_d_eval Class Reference

Forward function evaluation with preparation of derivative data.

10.115.1 Detailed Description

This class is a cached forward evaluator performing a function evaluation and the preparation of partial derivative information for backwards differentiation.

10.115.2 Member Typedef Documentation

10.115.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.115.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.115.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.115.3 Constructor & Destructor Documentation

10.115.3.1 coco::func_d_eval::func_d_eval (const std::vector< double > & __x, const variable_indicator & __v, const model & __m, std::vector< std::vector< double > > & __d, std::vector< double > * __c) [inline]

Constructor: __x is the point where the derivative shall be evaluated, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, __d the derivative data, and __c the cache (may be NULL).

Definition at line 243 of file der_evaluator.h.

10.115.3.2 coco::func_d_eval::func_d_eval (const func_d_eval & __x) [inline]

Standard Copy Constructor

Definition at line 258 of file der_evaluator.h.

10.115.3.3 coco::func_d_eval::~func_d_eval ( ) [inline]

Standard Destructor

Definition at line 261 of file der_evaluator.h.

10.115.4 Member Function Documentation

10.115.4.1 void coco::func_d_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 343 of file der_evaluator.h.

10.115.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.115.4.3 double coco::func_d_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_d_eval_type, expression_node, double, expression_const_walker >.

Definition at line 1031 of file der_evaluator.h.

10.115.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.115.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.115.4.6 void coco::func_d_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_d_eval_type, expression_node, double, expression_const_walker >.

Definition at line 278 of file der_evaluator.h.

10.115.4.7 int coco::func_d_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 280 of file der_evaluator.h.

10.115.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The ___data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.115.4.9 bool coco::func_d_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the value and derivative information for this node are already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_d_eval_type, expression_node, double, expression_const_walker >.

Definition at line 162 of file der_evaluator.h.

10.115.4.10 void coco::func_d_eval::new_point (const std::vector< double > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation point to ___x. The parameter ___v specifies which variables have changed value since the last evaluation.

Definition at line 270 of file der_evaluator.h.

10.115.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.115.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.115.4.13 void coco::func_d_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 353 of file der_evaluator.h.

10.115.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.115.4.15 expression_const_walker coco::func_d_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 264 of file der_evaluator.h.

10.115.4.16 int coco::func_d_eval::update (const double & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 384 of file der_evaluator.h.

10.115.4.17 int coco::func_d_eval::update (const expression_node & *__data*, const double & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 390 of file der_evaluator.h.

10.115.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.115.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.115.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.115.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.115.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.115.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.117.4 Member Function Documentation

10.117.4.1 void coco::func_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 251 of file func_evaluator.h.

10.117.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.117.4.3 double coco::func_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_eval_type, expression_node, double, expression_const_walker >.

Definition at line 735 of file func_evaluator.h.

10.117.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.117.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.117.4.6 void coco::func_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_eval_type, expression_node, double, expression_const_walker >.

Definition at line 173 of file func_evaluator.h.

10.117.4.7 int coco::func_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 175 of file func_evaluator.h.

10.117.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.117.4.9 bool coco::func_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the value for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_eval_type, expression_node, double, expression_const_walker >.

Definition at line 82 of file func_evaluator.h.

10.117.4.10 void coco::func_eval::new_point (const std::vector< double > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation point to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 165 of file func_evaluator.h.

10.117.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.117.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.117.4.13 void coco::func_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 260 of file func_evaluator.h.

10.117.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.117.4.15 expression_const_walker coco::func_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 159 of file func_evaluator.h.

10.117.4.16 int coco::func_eval::update (const double & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 278 of file func_evaluator.h.

10.117.4.17 int coco::func_eval::update (const expression_node & __data, const double & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 284 of file func_evaluator.h.

10.117.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.117.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.117.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.117.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.117.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.117.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

Protected Member Functions

- bool is_cached (const node_data_type &__data)

10.119.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation using the natural interval extension of the function, and it prepares partial interval derivative information for backwards interval differentiation.

10.119.2 Member Typedef Documentation

10.119.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.119.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.119.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.119.3 Constructor & Destructor Documentation

10.119.3.1 coco::func_id_eval::func_id_eval (const std::vector< interval > & __x, const std::vector< interval > & __rg, const variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > & __d, std::vector< interval > * __c, bool *intersect* = true, const std::vector< interval > * *_center* = NULL) [inline]

Constructor: __x is the box over which the interval derivative shall be evaluated, __rg contains the ranges of all the DAG nodes, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, __d the partial interval derivative data, and __c the cache (may be NULL).

Definition at line 248 of file ider_evaluator.h.

10.119.3.2 coco::func_id_eval::func_id_eval (const func_id_eval & __x) [inline]

Standard Copy Constructor

Definition at line 271 of file ider_evaluator.h.

10.119.3.3 coco::func_id_eval::~func_id_eval ( ) [inline]

Standard Destructor

Definition at line 274 of file ider_evaluator.h.

10.119.4 Member Function Documentation

10.119.4.1 void coco::func_id_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 376 of file ider_evaluator.h.

10.119.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.119.4.3 interval coco::func_id_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_id_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 1545 of file ider_evaluator.h.

10.119.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.119.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.119.4.6 void coco::func_id_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_id_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 306 of file ider_evaluator.h.

10.119.4.7 int coco::func_id_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 308 of file ider_evaluator.h.

10.119.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.119.4.9 bool coco::func_id_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range and interval derivative information for this node are already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_id_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 168 of file ider_evaluator.h.

10.119.4.10 void coco::func_id_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 283 of file ider_evaluator.h.

10.119.4.11 void coco::func_id_eval::new_center (const std::vector< interval > * _center) [inline]

This method changes the center for centered forms to _center.

Definition at line 299 of file ider_evaluator.h.

10.119.4.12 void coco::func_id_eval::new_range (const std::vector< interval > & __rg, const variable_indicator & __v) [inline]

This method changes the node ranges to __rg. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 292 of file ider_evaluator.h.

10.119.4.13 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.119.4.14 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.119.4.15 void coco::func_id_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 389 of file ider_evaluator.h.

10.119.4.16 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.119.4.17 expression_const_walker coco::func_id_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 277 of file ider_evaluator.h.

10.119.4.18 int coco::func_id_eval::update (const interval & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 419 of file ider_evaluator.h.

10.119.4.19 int coco::func_id_eval::update (const expression_node & __data, const interval & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 425 of file ider_evaluator.h.

10.119.4.20 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.119.4.21 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.119.4.22 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.119.4.23 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.119.4.24 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.119.4.25 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.122.1 Member Typedef Documentation

10.122.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.122.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.122.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.122.2 Constructor & Destructor Documentation

10.122.2.1 coco::func_islp2_eval::func_islp2_eval (const std::vector< Islope > & __z, const std::vector< double > & __w, const std::vector< interval > & __rg, const variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > & __c, std::vector< std::vector< interval > > & __d, std::vector< std::vector< interval > > & __h, std::vector< Islope > * __zc, std::vector< interval > * __wc, bool inters = true) [inline]

Definition at line 237 of file islp2_evaluator.h.

10.122.2.2 coco::func_islp2_eval::func_islp2_eval (const func_islp2_eval & __x) [inline]

Definition at line 286 of file islp2_evaluator.h.

10.122.2.3 coco::func_islp2_eval::~func_islp2_eval ( ) [inline]

Definition at line 290 of file islp2_evaluator.h.

10.122.3 Member Function Documentation

10.122.3.1 void coco::func_islp2_eval::calculate (const expression_node & __data) [inline]

Definition at line 423 of file islp2_evaluator.h.

10.122.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.122.3.3 func_islp2_eval_ret_type coco::func_islp2_eval::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_islp2_eval_type, expression_node, func_islp2_eval_ret_type, expression_const_walker >.

Definition at line 1439 of file islp2_evaluator.h.

10.122.3.4 void coco::func_islp2_eval::changeIntersectBehaviour (bool *intersect*) [inline]

Definition at line 334 of file islp2_evaluator.h.

10.122.3.5 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `___data` parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.122.3.6 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.122.3.7 void coco::func_islp2_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_islp2_eval_type, expression_node, func_islp2_eval_ret_type, expression_const_walker >.

Definition at line 339 of file islp2_evaluator.h.

10.122.3.8 int coco::func_islp2_eval::initialize (const expression_node & *__data*) [inline]

Definition at line 349 of file islp2_evaluator.h.

10.122.3.9 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The `___data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.122.3.10 bool coco::func_islp2_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_islp2_eval_type, expression_node, func_islp2_eval_ret_type, expression_const_walker >.

Definition at line 194 of file islp2_evaluator.h.

10.122.3.11 void coco::func_islp2_eval::newPoint (const std::vector< Islope > & __z, const std::vector< double > & __w, const variable_indicator & __v) [inline]

Definition at line 295 of file islp2_evaluator.h.

10.122.3.12 void coco::func_islp2_eval::newRange (const std::vector< interval > & __rg, const variable_indicator & __v) [inline]

This method changes the node ranges to ___rg. The parameter $*$ ___v specifies which variables have changed value since the last $*$ evaluation.

Definition at line 328 of file islp2_evaluator.h.

10.122.3.13 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.122.3.14 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.122.3.15 void coco::func_islp2_eval::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 432 of file islp2_evaluator.h.

10.122.3.16 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.122.3.17 expression_const_walker coco::func_islp2_eval::short_cut_to (const expression_node & __data) [inline]

Definition at line 292 of file islp2_evaluator.h.

10.122.3.18 int coco::func_islp2_eval::update (const func_islp2_eval_ret_type & __rval) [inline]

Definition at line 439 of file islp2_evaluator.h.

10.122.3.19 int coco::func_islp2_eval::update (const expression_node & __data, const func_islp2_eval_ret_type & __rval) [inline]

Definition at line 449 of file islp2_evaluator.h.

10.122.3.20 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.122.3.21 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The ___data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.122.3.22 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter

`false`.

Definition at line 763 of file search_graph.cc.

10.122.3.23 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.122.3.24 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.122.3.25 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.125.1 Detailed Description

This class is a cached forward evaluator performing a function evaluation at the center, and it prepares partial first order slope information for backwards slope calculation.

10.125.2 Member Typedef Documentation

10.125.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.125.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.125.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.125.3 Constructor & Destructor Documentation

10.125.3.1 coco::func_islp_eval::func_islp_eval (const std::vector< double > & *__z*, const std::vector< interval > & *__rg*, const variable_indicator & *__v*, const model & *__m*, std::vector< std::vector< interval > > & *__d*, std::vector< interval > & *__f*, bool *intsect* = true) [inline]

Constructor: __z is the center of the slope, __rg contains the ranges of all the DAG nodes, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies

the DAG, __d the partial first order slope data, and __f the center values at each node.

Definition at line 201 of file islp_evaluator.h.

10.125.3.2 coco::func_islp_eval::func_islp_eval (const func_islp_eval & __x) [inline]

Standard Copy Constructor

Definition at line 220 of file islp_evaluator.h.

10.125.3.3 coco::func_islp_eval::~func_islp_eval ( ) [inline]

Standard Destructor

Definition at line 223 of file islp_evaluator.h.

10.125.4 Member Function Documentation

10.125.4.1 void coco::func_islp_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 325 of file islp_evaluator.h.

10.125.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.125.4.3 func_islp_return_type coco::func_islp_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_islp_eval_type, expression_node, func_islp_return_type, expression_const_walker >.

Definition at line 1529 of file islp_evaluator.h.

10.125.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.125.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.125.4.6 void coco::func_islp_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< func_islp_eval_type, expression_node, func_islp_return_type, expression_const_walker >.

Definition at line 256 of file islp_evaluator.h.

10.125.4.7 int coco::func_islp_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 258 of file islp_evaluator.h.

10.125.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.125.4.9 bool coco::func_islp_eval::is_cached (const expression_node & __data) [inline, protected]

This function determines, whether the function value and first order slope information for this node are already available.

Definition at line 179 of file islp_evaluator.h.

10.125.4.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.125.4.11 void coco::func_islp_eval::new_point (const std::vector< double > & __x, const variable_indicator & __v) [inline]

This method changes the center to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 232 of file islp_evaluator.h.

10.125.4.12 void coco::func_islp_eval::new_range (const std::vector< interval > & __rg, const variable_indicator & __v) [inline]

This method changes the node ranges to ___rg. The parameter ___v specifies which variables have changed value since the last evaluation.

Definition at line 241 of file islp_evaluator.h.

10.125.4.13 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.125.4.14 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.125.4.15 void coco::func_islp_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 338 of file islp_evaluator.h.

10.125.4.16 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.125.4.17 void coco::func_islp_eval::set_do_intersect (bool intsect) [inline]

This method changes the intersect behaviour of the evaluator.

Definition at line 249 of file islp_evaluator.h.

10.125.4.18 expression_const_walker coco::func_islp_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 226 of file islp_evaluator.h.

10.125.4.19 int coco::func_islp_eval::update (const func_islp_return_type & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 361 of file islp_evaluator.h.

10.125.4.20 int coco::func_islp_eval::update (const expression_node & *__data,* const func_islp_return_type & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 367 of file islp_evaluator.h.

10.125.4.21 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data,* const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.125.4.22 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.125.4.23 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.125.4.24 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.125.4.25 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.125.4.26 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

- islp_evaluator.h

10.126 coco::func_islp_eval_type Struct Reference

Visitor data for func_id_eval.

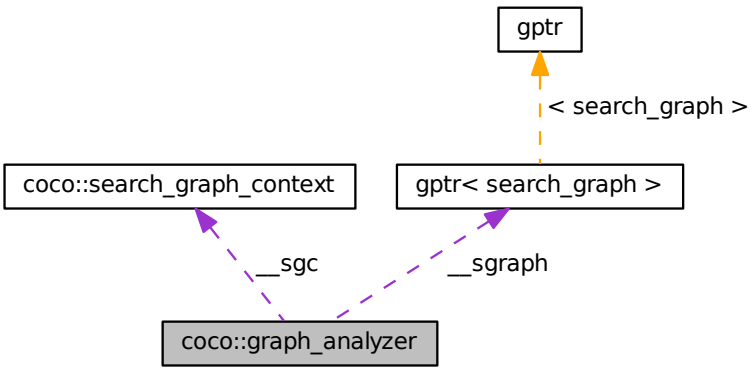
10.129 coco::graph_analyzer Class Reference

Graph analyzer base class.

`#include <graph_analyzer.h>`

Collaboration diagram for coco::graph_analyzer:



Public Member Functions

- graph_analyzer (const gptr< search_graph > &sgraph, const search_focus &sfoc, const std::string &__n)
- graph_analyzer (const gptr< search_graph > &sgraph, const std::string &__n)
- virtual ~graph_analyzer ()
- virtual bool update_engine (const gptr< search_graph > &sgraph, const search_focus &sfoc)
- virtual bool update_engine (const gptr< search_graph > &sgraph)
- virtual ga_return_type analyze (const control_data &__c)
- const std::string & get_name () const

Protected Attributes

- std::string __name
- const gptr< search_graph > * __sgraph
- const search_focus * __sfoc
- const search_graph_context * __sgc
- const vdbl::viewdbase * __vdb

10.129.1 Detailed Description

This is the base class of all COCONUT graph analyzer modules. A graph analyzer is an inference module, which specializes in analyzing the search graph. A typical graph analyzer is, e.g., the box chooser, which selects the next search_node from the search_graph.

10.129.2 Constructor & Destructor Documentation

10.129.2.1 coco::graph_analyzer::graph_analyzer (const gptr< search_graph > & *sgraph*, const search_focus & *sfoc*, const std::string & *__n*) [inline]

This is the standard constructor for a graph_analyzer. It sets the indentifier string to `n`, the search graph to `sgraph`, and the search focus to `sfoc`.

Definition at line 102 of file graph_analyzer.h.

10.129.2.2 coco::graph_analyzer::graph_analyzer (const gptr< search_graph > & *sgraph*, const std::string & *__n*) [inline]

This is the standard constructor for a graph_analyzer if no search focus is available. It sets the indentifier string to `n` and the search graph to `sgraph`.

Definition at line 113 of file graph_analyzer.h.

10.129.2.3 virtual coco::graph_analyzer::~graph_analyzer ( ) [inline, virtual]

Standard Destructor

Definition at line 121 of file graph_analyzer.h.

10.129.3 Member Function Documentation

10.129.3.1 virtual ga_return_type coco::graph_analyzer::analyze (const control_data & *__c*) [inline, virtual]

This method is the main method of a graph analyzer. It is supposed to analyze the search graph and to return the information gained in the ga_return_type structure. This method is overloaded by the various subclasses. Service information and parameters are provided via the control_data structure __c.

Definition at line 151 of file graph_analyzer.h.

10.129.3.2 const std::string& coco::graph_analyzer::get_name ( ) const [inline]

The get_name method returns the identifier string of the graph analyzer.

Definition at line 155 of file graph_analyzer.h.

10.129.3.3 virtual bool coco::graph_analyzer::update_engine (const gptr< search_graph > & *sgraph*, const search_focus & *sfoc*) [inline, virtual]

This update_engine method changes the search graph to sgraph and the search focus to sfoc.

Definition at line 125 of file graph_analyzer.h.

10.129.3.4 virtual bool coco::graph_analyzer::update_engine (const gptr< search_graph > & *sgraph*) [inline, virtual]

This update_engine method changes the search graph to sgraph and clears the search focus.

Definition at line 137 of file graph_analyzer.h.

10.129.4 Member Data Documentation

10.129.4.1 std::string coco::graph_analyzer::__name [protected]

This is the identifier string for a graph analyzer.

Definition at line 87 of file graph_analyzer.h.

10.129.4.2 const search_focus* coco::graph_analyzer::__sfoc [protected]

This is the current search focus.

Definition at line 91 of file graph_analyzer.h.

10.129.4.3 const search_graph_context* coco::graph_analyzer::__sgc [protected]

This is the search_graph_context for extracting information from the search database.

Definition at line 94 of file graph_analyzer.h.

10.129.4.4 const gptr<search_graph>* coco::graph_analyzer::__sgraph [protected]

This variable contains a global pointer to the search graph.

Definition at line 89 of file graph_analyzer.h.

10.129.4.5 const vdbl::viewdbase* coco::graph_analyzer::__vdb [protected]

This is a view to the search database.

Definition at line 96 of file graph_analyzer.h.

The documentation for this class was generated from the following file:

- graph_analyzer.h

10.130 coco::graph_analyzer_exception Class Reference

Graph analyzer exception class.

- virtual std::string message () const throw ()
- virtual std::string message () const throw ()
- virtual std::string message () const throw ()
- virtual std::string message () const throw ()

10.130.1 Detailed Description

This is the exceptions class thrown by graph_analyzer subclasses. Every properly coded COCONUT graph analyzer module should only throw exceptions of this type.

10.130.2 Constructor & Destructor Documentation

10.130.2.1 coco::graph_analyzer_exception::graph_analyzer_exception (const std::string & *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 60 of file graph_analyzer.h.

10.130.2.2 coco::graph_analyzer_exception::graph_analyzer_exception (const char * *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 63 of file graph_analyzer.h.

10.130.2.3 virtual coco::graph_analyzer_exception::~graph_analyzer_exception ( ) throw () [inline, virtual]

Standard Destructor

Definition at line 67 of file graph_analyzer.h.

10.130.3 Member Function Documentation

10.130.3.1 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file expression.h.

10.130.3.2 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.130.3.3 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.130.3.4 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.130.3.5 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.130.3.6 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.130.3.7 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.130.3.8 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file expression.h.

10.130.3.9 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.130.3.10 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.130.3.11 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.130.3.12 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.130.3.13 const char * coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

Definition at line 57 of file api_exception.cc.

10.130.3.14 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.130.3.15 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.130.3.16 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.130.3.17 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.130.3.18 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file expression.h.

10.130.3.19 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.130.3.20 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

The documentation for this class was generated from the following file:

- graph_analyzer.h

10.131 coco::graphorder_visitor Class Reference

This visitor class is used for computing a graph order.

Public Member Functions

- graphorder_visitor (std::vector< unsigned int > &__v, std::vector< bool > &__b, unsigned int __k=0)
- graphorder_visitor (const graphorder_visitor &__c)

- unsigned int vvalue ()
- unsigned int value ()
- bool postorder (const expression_node &r)
- void collect (const expression_node &r, unsigned int __v)
- void vcollect (unsigned int __v)

10.131.1 Detailed Description

This postorder visitor computes an order of the nodes compatible with the DAG structure.

10.131.2 Constructor & Destructor Documentation

10.131.2.1 coco::graphorder_visitor::graphorder_visitor (std::vector< unsigned int > & __v, std::vector< bool > & __b, unsigned int __k = 0) [inline]

Constructor setting phi to __v, phi_defined to __b, and k to __k.

Definition at line 56 of file graphorder.cc.

10.131.2.2 coco::graphorder_visitor::graphorder_visitor (const graphorder_visitor & __c) [inline]

Standard Copy Constructor

Definition at line 63 of file graphorder.cc.

10.131.3 Member Function Documentation

10.131.3.1 void coco::graphorder_visitor::collect (const expression_node & r, unsigned int __v) [inline]

This is a method required for a postorder visitor.

Definition at line 83 of file graphorder.cc.

10.131.3.2 bool coco::graphorder_visitor::postorder (const expression_node & r) [inline]

This is a method required for a postorder visitor.

Definition at line 72 of file graphorder.cc.

10.131.3.3 unsigned int coco::graphorder_visitor::value ( ) [inline]

This is a method required for a postorder visitor.

Definition at line 70 of file graphorder.cc.

10.131.3.4 void coco::graphorder_visitor::vcollect (unsigned int __v) [inline]

This is a method required for a postorder visitor.

Definition at line 88 of file graphorder.cc.

10.131.3.5 unsigned int coco::graphorder_visitor::vvalue ( ) [inline]

This is a method required for a postorder visitor.

Definition at line 69 of file graphorder.cc.

Definition at line 1288 of file hess_evaluator.h.

10.133.2.3 coco::hessBackwardEvaluator::~hessBackwardEvaluator ( ) [inline]

Definition at line 1290 of file hess_evaluator.h.

10.133.3 Member Function Documentation

10.133.3.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.133.3.2 int coco::hessBackwardEvaluator::calculate (const expression_node & *__data*) [inline]

Definition at line 1330 of file hess_evaluator.h.

10.133.3.3 bool coco::hessBackwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< hessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1569 of file hess_evaluator.h.

10.133.3.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.133.3.5 void coco::hessBackwardEvaluator::cleanup (const expression_node & __data) [inline]

Definition at line 1467 of file hess_evaluator.h.

10.133.3.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.133.3.7 void coco::hessBackwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< hessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1319 of file hess_evaluator.h.

10.133.3.8 bool coco::hessBackwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< hessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1245 of file hess_evaluator.h.

10.133.3.9 void coco::hessBackwardEvaluator::newPoint (std::vector< std::vector< double > > * __der_data, std::vector< std::vector< double > > * __hess_data, const variable_indicator & __v) [inline]

Definition at line 1292 of file hess_evaluator.h.

10.133.3.10 void coco::hessBackwardEvaluator::newResult (std::vector< double > * __grad, std::vector< double > * __hess) [inline]

Definition at line 1302 of file hess_evaluator.h.

10.133.3.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.133.3.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.133.3.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.133.3.14 void coco::hessBackwardEvaluator::set_mult (double scal) [inline]

Definition at line 1308 of file hess_evaluator.h.

10.133.3.15 expression_const_walker coco::hessBackwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 1315 of file hess_evaluator.h.

10.133.3.16 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.133.3.17 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.133.3.18 int coco::hessBackwardEvaluator::update (const bool & *__rval*) [inline]

Definition at line 1505 of file hess_evaluator.h.

10.133.3.19 int coco::hessBackwardEvaluator::update (const expression_node & *__data*, const bool & *__rval*) [inline]

Definition at line 1515 of file hess_evaluator.h.

10.133.3.20 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.133.3.21 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.133.3.22 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.133.3.23 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

The documentation for this class was generated from the following file:

- hess_evaluator.h

10.135.1 Member Typedef Documentation

10.135.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.135.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.135.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.135.2 Constructor & Destructor Documentation

10.135.2.1 coco::hessForwardEvaluator::hessForwardEvaluator (const std::vector< diffNumber > & __x, const variable_indicator & __v, const model & __m, std::vector< std::vector< double > > & __d, std::vector< std::vector< double > > & __h, std::vector< diffNumber > * __c) [inline]

Definition at line 250 of file hess_evaluator.h.

10.135.2.2 coco::hessForwardEvaluator::hessForwardEvaluator (const hessForwardEvaluator & __x) [inline]

Definition at line 287 of file hess_evaluator.h.

10.135.2.3 coco::hessForwardEvaluator::~hessForwardEvaluator ( ) [inline]

Definition at line 291 of file hess_evaluator.h.

10.135.3 Member Function Documentation

10.135.3.1 void coco::hessForwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 409 of file hess_evaluator.h.

10.135.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.135.3.3 hessForwardEvaluatorReturnValue coco::hessForwardEvaluator::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< hessForwardEvaluatorType, expression_node, hessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 1205 of file hess_evaluator.h.

10.135.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.135.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.135.3.6 void coco::hessForwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< hessForwardEvaluatorType, expression_node, hessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 321 of file hess_evaluator.h.

10.135.3.7 int coco::hessForwardEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 330 of file hess_evaluator.h.

10.135.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.135.3.9 bool coco::hessForwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< hessForwardEvaluatorType, expression_node, hessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 177 of file hess_evaluator.h.

10.135.3.10 void coco::hessForwardEvaluator::newPoint (const std::vector< diffNumber > & __x, const variable_indicator & __v) [inline]

Definition at line 296 of file hess_evaluator.h.

10.135.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.135.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.135.3.13 void coco::hessForwardEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 420 of file hess_evaluator.h.

10.135.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.135.3.15 expression_const_walker coco::hessForwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 293 of file hess_evaluator.h.

10.135.3.16 int coco::hessForwardEvaluator::update (const diffNumber & __rval) [inline]

Definition at line 427 of file hess_evaluator.h.

10.135.3.17 int coco::hessForwardEvaluator::update (const expression_node & __data, const hessForwardEvaluatorReturnValue & __rval) [inline]

Definition at line 437 of file hess_evaluator.h.

10.135.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.135.3.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.135.3.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter

`false`.

Definition at line 763 of file search_graph.cc.

10.135.3.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.135.3.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.135.3.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.139.1 Member Typedef Documentation

10.139.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.139.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.139.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.139.2 Constructor & Destructor Documentation

10.139.2.1 coco::hessPreparationEvaluator::hessPreparationEvaluator (std::vector< std::vector< double > > & *__d*, std::vector< std::vector< double > > & *__h*, unsigned int *_num_of_nodes*) [inline]

Definition at line 86 of file hess_evaluator.h.

10.139.2.2 coco::hessPreparationEvaluator::hessPreparationEvaluator (const hessPreparationEvaluator & *__x*) [inline]

Definition at line 102 of file hess_evaluator.h.

10.139.2.3 coco::hessPreparationEvaluator::~hessPreparationEvaluator ( ) [inline]

Definition at line 105 of file hess_evaluator.h.

10.139.3 Member Function Documentation

10.139.3.1 void coco::hessPreparationEvaluator::calculate (const expression_node & *__data*) [inline]

Definition at line 126 of file hess_evaluator.h.

10.139.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.139.3.3 bool coco::hessPreparationEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< hessPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 138 of file hess_evaluator.h.

10.139.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.139.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.139.3.6 void coco::hessPreparationEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< hessPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 107 of file hess_evaluator.h.

10.139.3.7 int coco::hessPreparationEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 116 of file hess_evaluator.h.

10.139.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The ___data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.139.3.9 bool coco::hessPreparationEvaluator::is_cached (const expression_node & __data) [inline]

Definition at line 109 of file hess_evaluator.h.

10.139.3.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.139.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.139.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.139.3.13 void coco::hessPreparationEvaluator::retrieve_from_cache (const expression_node & *__data*) [inline]

Definition at line 114 of file hess_evaluator.h.

10.139.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.139.3.15 int coco::hessPreparationEvaluator::update (bool *__rval*) [inline]

Definition at line 128 of file hess_evaluator.h.

10.139.3.16 int coco::hessPreparationEvaluator::update (const expression_node & *__data*, bool *__rval*) [inline]

Definition at line 130 of file hess_evaluator.h.

10.139.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.139.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.139.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.139.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.139.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.139.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.141.1 Detailed Description

hsf_func is a one dimensional function defined by (exp(-c*sqrt(x))-exp(c*sqrt(x)))/sqrt(x) = -2*sinh(c*sqrt(x))/sqrt(x), where c is a real constant. Its domain is]0,inf[.

10.141.2 Member Typedef Documentation

10.141.2.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info [inherited]

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.141.2.2 typedef std::vector<point_info> coco::d1func::point_list [inherited]

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.141.3 Member Enumeration Documentation

10.141.3.1 enum coco::d1func::d1func_point_t [inherited]

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point-: At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup

d1fp_oddpoledn

d1fp_jumpldef

d1fp_jumpludef

d1fp_point

d1fp_undefined

d1fp_wild

d1fp_jumprdef

d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.141.3.2 enum coco::d1func::d1solve_t [inherited]

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0

d1solve_1

d1solve_2

Definition at line 106 of file d1func.h.

10.141.4 Constructor & Destructor Documentation

10.141.4.1 coco::hsf_func::hsf_func (double _c, unsigned int MAXORDER = 5) [inline]

Definition at line 377 of file hsf.h.

10.141.5 Member Function Documentation

10.141.5.1 virtual uint64_t coco::hsf_func::chash ( ) [inline, virtual]

the const hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 54 of file hsf.h.

10.141.5.2 convex_info coco::d1func::convexity (const interval & i, unsigned int k) const [virtual, inherited]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.141.5.3 virtual std::string coco::hsf_func::dag_out ( ) const [inline, virtual]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented from coco::d1func.

Definition at line 60 of file hsf.h.

10.141.5.4 virtual int coco::d1func::degree_update (int in_degree) const [inline, virtual, inherited]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.141.5.5 virtual int coco::hsf_func::differentiability (const interval & i, unsigned int k) const [inline, virtual]

return differentiability information on `i`.

Reimplemented from coco::d1func.

Definition at line 383 of file hsf.h.

10.141.5.6 virtual double coco::hsf_func::eval (double x, unsigned int k) const [inline, virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 66 of file hsf.h.

10.141.5.7 diffNumber coco::d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual, inherited]

the diffNumber evaluation

Reimplemented in coco::dag_d1func.

Definition at line 349 of file d1func.cc.

10.141.5.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.141.5.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 390 of file d1func.cc.

10.141.5.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual, inherited]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.141.5.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.141.5.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual, inherited]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.141.5.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 794 of file d1func.cc.

10.141.5.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval first order slope evaluation at center z

Definition at line 1403 of file d1func.cc.

10.141.5.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at centers z and y

Definition at line 1984 of file d1func.cc.

10.141.5.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.141.5.17 virtual std::pair<double,double> coco::d1func::evald (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 437 of file d1func.h.

10.141.5.18 virtual void coco::d1func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual, inherited]

the point, first to third derivative evaluation

Reimplemented in coco::xexp_func.

Definition at line 443 of file d1func.h.

10.141.5.19 virtual std::triple<double,double,double> coco::d1func::evalt (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and first and second derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 440 of file d1func.h.

10.141.5.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual, inherited]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.141.5.21 virtual const char* coco::hsf_func::func_name ( ) const [inline, virtual]

the name of the d1func.

Implements coco::d1func.

Definition at line 57 of file hsf.h.

10.141.5.22 virtual interval coco::hsf_func::imperfect_eval (const interval & *x*, unsigned int *k*) const [inline, virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 176 of file hsf.h.

10.141.5.23 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual, inherited]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.141.5.24 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1708 of file d1func.cc.

10.141.5.25 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1778 of file d1func.cc.

10.141.5.26 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.141.5.27 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual, inherited]

the other comparison operator

Definition at line 476 of file d1func.h.

10.141.5.28 virtual bool coco::hsf_func::operator== (const d1func & *b*) const [inline, virtual]

the comparison operator

Reimplemented from coco::d1func.

Definition at line 319 of file hsf.h.

10.141.5.29 virtual bool coco::d1func::order_is_supported (unsigned int *k*) const [inline, virtual, inherited]

check whether evaluation of this order is supported.

Definition at line 460 of file d1func.h.

10.141.5.30 virtual std::ostream& coco::d1func::print_add (std::ostream & *o*) const [inline, virtual, inherited]

additional info written in DAG format (it must contain dag lines)

Reimplemented in coco::dag_d1func.

Definition at line 208 of file d1func.h.

10.141.5.31 virtual std::string coco::hsf_func::print_params ( ) const [inline, virtual]

the parameters written in printable form

Reimplemented from coco::d1func.

Definition at line 63 of file hsf.h.

10.141.5.32 virtual void coco::hsf_func::raise_order (unsigned int *neworder*) [inline, virtual]

raise the order of the supported function evaluation to `neworder`

Reimplemented from coco::d1func.

Definition at line 326 of file hsf.h.

10.141.5.33 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual, inherited]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.141.5.34 virtual uint64_t coco::hsf_func::thash ( ) [inline, virtual]

the pure hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 51 of file hsf.h.

10.141.5.35 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const [inherited]

Definition at line 2415 of file d1func.cc.

10.141.6 Member Data Documentation

10.141.6.1 std::vector<func_info> coco::d1func::_f [protected, inherited]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.141.6.2 int coco::d1func::basic_diff [protected, inherited]

basic differentiability

Definition at line 160 of file d1func.h.

10.141.6.3 double coco::d1func::dod_left [protected, inherited]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.141.6.4 double coco::d1func::dod_right [protected, inherited]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.142.1 Detailed Description

This class is a cached backward evaluator performing an interval gradient evaluation with available partial interval derivative information.

10.142.2 Member Typedef Documentation

10.142.2.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.142.2.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.142.2.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.142.3 Constructor & Destructor Documentation

10.142.3.1 coco::ider_eval::ider_eval (const std::vector< interval > & __x, std::vector< std::vector< interval > > & __ider_data, variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > * __d, std::vector< interval > & __grad) [inline]

Constructor: __x is the evaluation box, __ider_data contains the partial interval derivative information, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, and __d the cache (may be NULL). Eventually, __grad is a reference to the result vector. This vector must have the correct length and has to be initialized with zero, since all components are actually computed by adding to the components of __grad.

Definition at line 1609 of file ider_evaluator.h.

10.142.4 Member Function Documentation

10.142.4.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.142.4.2 int coco::ider_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1668 of file ider_evaluator.h.

10.142.4.3 bool coco::ider_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< ider_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1763 of file ider_evaluator.h.

10.142.4.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.142.4.5 void coco::ider_eval::cleanup (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1719 of file ider_evaluator.h.

10.142.4.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.142.4.7 void coco::ider_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< ider_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1662 of file ider_evaluator.h.

10.142.4.8 bool coco::ider_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the interval gradient for this node is already available.

Reimplemented from coco::coco::cached_backward_evaluator_base< ider_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 1587 of file ider_evaluator.h.

10.142.4.9 void coco::ider_eval::new_box (std::vector< interval > & __x, std::vector< std::vector< interval > > & __ider_data, const variable_indicator & __v) [inline]

This method changes the evaluation box to ___x and the new interval derivative data ___ider_data. The parameter ___v specifies which variables have changed value since the last evaluation.

Definition at line 1633 of file ider_evaluator.h.

10.142.4.10 void coco::ider_eval::new_result (std::vector< interval > & __grad) [inline]

This method changes the result vector to ___grad.

Definition at line 1643 of file ider_evaluator.h.

10.142.4.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.142.4.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.142.4.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.142.4.14 void coco::ider_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1730 of file ider_evaluator.h.

10.142.4.15 void coco::ider_eval::set_mult (const interval & *scal*) [inline]

This method causes the gradient to be multiplied by `scal`.

Definition at line 1649 of file ider_evaluator.h.

10.142.4.16 expression_const_walker coco::ider_eval::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 1656 of file ider_evaluator.h.

10.142.4.17 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.142.4.18 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.142.4.19 int coco::ider_eval::update (const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1737 of file ider_evaluator.h.

10.142.4.20 int coco::ider_eval::update (const expression_node & *__data*, const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1744 of file ider_evaluator.h.

10.142.4.21 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.142.4.22 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.142.4.23 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.142.4.24 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.144.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural interval extension together with a derivative range evaluation.

10.144.2 Member Typedef Documentation

10.144.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.144.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.144.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.144.3 Constructor & Destructor Documentation

10.144.3.1 coco::iderf_eval::iderf_eval (const std::vector< interval > & __x, const std::vector< interval > & __rg, const variable_indicator & __v, const model & __m, std::vector< iderf_ret_type > * __c, bool do_i = true) [inline]

Constructor: ___x is the box over which the function range shall be evaluated, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___c the cache (may be NULL). The boolean do_i determines whether the natural interval extension will use known node ranges for reducing the ranges.

Definition at line 156 of file iderf_evaluator.h.

10.144.4 Member Function Documentation

10.144.4.1 void coco::iderf_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 256 of file iderf_evaluator.h.

10.144.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.144.4.3 iderf_ret_type coco::iderf_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< iderf_eval_type, expression_node, iderf_ret_type, expression_const_walker >.

Definition at line 901 of file iderf_evaluator.h.

10.144.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.144.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.144.4.6 void coco::iderf_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< iderf_eval_type, expression_node, iderf_ret_type, expression_const_walker >.

Definition at line 192 of file iderf_evaluator.h.

10.144.4.7 int coco::iderf_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 194 of file iderf_evaluator.h.

10.144.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.144.4.9 bool coco::iderf_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< iderf_eval_type, expression_node, iderf_ret_type, expression_const_walker >.

Definition at line 101 of file iderf_evaluator.h.

10.144.4.10 void coco::iderf_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 184 of file iderf_evaluator.h.

10.144.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.144.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.144.4.13 void coco::iderf_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 271 of file iderf_evaluator.h.

10.144.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.144.4.15 expression_const_walker coco::iderf_eval::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 178 of file iderf_evaluator.h.

10.144.4.16 int coco::iderf_eval::update (const iderf_ret_type & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 293 of file iderf_evaluator.h.

10.144.4.17 int coco::iderf_eval::update (const expression_node & *__data*, const iderf_ret_type & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 299 of file iderf_evaluator.h.

10.144.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.144.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.144.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.144.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.144.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.144.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

10.145.1 Detailed Description

This class is the visitor data type for the iderf_eval evaluator.

10.145.2 Member Data Documentation

10.145.2.1 std::vector<iderf_ret_type>* coco::iderf_eval_type::cache

the function range cache

Definition at line 68 of file iderf_evaluator.h.

10.145.2.2 interval_st coco::iderf_eval_type::d

Definition at line 72 of file iderf_evaluator.h.

10.145.2.3 bool coco::iderf_eval_type::do_intersect

compute an intersection with the node range?

Definition at line 76 of file iderf_evaluator.h.

10.145.2.4 int coco::iderf_eval_type::info

Definition at line 72 of file iderf_evaluator.h.

10.145.2.5 const model* coco::iderf_eval_type::mod

the DAG

Definition at line 71 of file iderf_evaluator.h.

10.145.2.6 unsigned int coco::iderf_eval_type::n

children counter

Definition at line 75 of file iderf_evaluator.h.

10.145.2.7 void* coco::iderf_eval_type::p

Definition at line 72 of file iderf_evaluator.h.

10.145.2.8 iderf_ret_type coco::iderf_eval_type::r

return value

Definition at line 74 of file iderf_evaluator.h.

10.145.2.9 const std::vector<interval>* coco::iderf_eval_type::range

the ranges of all nodes

Definition at line 67 of file iderf_evaluator.h.

10.145.2.10 union { ... } coco::iderf_eval_type::u

additional data for complex nodes

10.145.2.11 const std::vector<interval>* coco::iderf_eval_type::x

the box

Definition at line 66 of file iderf_evaluator.h.

The documentation for this struct was generated from the following file:

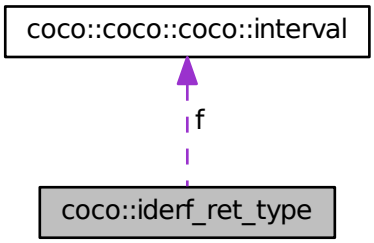
- iderf_evaluator.h

10.146 coco::iderf_ret_type Struct Reference

Visitor data for iderf_eval return value.

`#include <iderf_evaluator.h>`

Collaboration diagram for coco::iderf_ret_type:



Public Attributes

- interval f
- vmtl::sparse_vector< interval > g

10.146.1 Detailed Description

This class is the visitor data type for the return type of the iderf_eval evaluator.

10.146.2 Member Data Documentation

10.146.2.1 interval coco::iderf_ret_type::f

Definition at line 51 of file iderf_evaluator.h.

10.146.2.2 vmtl::sparse_vector<interval> coco::iderf_ret_type::g

Definition at line 52 of file iderf_evaluator.h.

The documentation for this struct was generated from the following file:

- iderf_evaluator.h

10.147 coco::ie_return_type Class Reference

The return class of all inference engines.

`#include <ie_rettype.h>`
