10.147.1 Detailed Description

This class is returned by the `infer` method of all COCONUT inference engines. It holds the reason of termination (the return code) of the engine, the deltas with weights and certificates calculated by the engine, and additional information the engine provides.

10.147.2 Constructor & Destructor Documentation

10.147.2.1 coco::ie_return_type::ie_return_type ( ) [inline]

Standard Constructor

Definition at line 71 of file ie_rettype.h.

10.147.2.2 coco::ie_return_type::ie_return_type (const termination_reason & __t) [inline]

Constructor, which sets the termination_reason to ___t

Definition at line 73 of file ie_rettype.h.

10.147.2.3 coco::ie_return_type::ie_return_type (const delta_base * __d, double __w) [inline]

Constructor, which initializes the ie_return_type with one delta ___d and the corresponding weight ___w.

Definition at line 77 of file ie_rettype.h.

10.147.2.4 coco::ie_return_type::ie_return_type (const delta_base * __d, double __w, const certificate_base * __c) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w and certificate ___c.

Definition at line 83 of file ie_rettype.h.

10.147.2.5 coco::ie_return_type::ie_return_type (const std::pair< delta_base *, double > & __d) [inline]

Constructor, which initializes the ie_return_type with one delta and the corresponding weight collected in a pair ___d.

Definition at line 90 of file ie_rettype.h.

10.147.2.6 coco::ie_return_type::ie_return_type (const std::triple< delta_base *, double, certificate_base * > & __d) [inline]

Constructor, which initializes the ie_return_type with one delta, the corresponding weight and certificate collected in a triple ___d.

Definition at line 96 of file ie_rettype.h.

10.147.2.7 coco::ie_return_type::ie_return_type (delta __d, double __w) [inline]

Constructor, which initializes the ie_return_type with one delta ___d and the corresponding weight ___w.

Definition at line 103 of file ie_rettype.h.

10.147.2.8 coco::ie_return_type::ie_return_type (delta __d, double __w, certificate __c) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w and certificate ___c.

Definition at line 109 of file ie_rettype.h.

10.147.2.9 coco::ie_return_type::ie_return_type (const std::pair< delta, double > & __d) [inline]

Constructor, which initializes the ie_return_type with one delta and the corresponding weight collected in a pair ___d.

Definition at line 114 of file ie_rettype.h.

10.147.2.10 coco::ie_return_type::ie_return_type (const std::triple< delta, double, certificate > & __d) [inline]

Constructor, which initializes the ie_return_type with one delta, the corresponding weight and certificate collected in a triple ___d.

Definition at line 119 of file ie_rettype.h.

10.147.2.11 coco::ie_return_type::ie_return_type (const std::list< delta > & __d, const std::list< double > & __w) [inline]

Constructor, which initializes the ie_return_type with a list of deltas and the corresponding list of weights.

Definition at line 124 of file ie_rettype.h.

10.147.2.12 coco::ie_return_type::ie_return_type (const std::list< delta > & __d, const std::list< double > & __w, const std::list< certificate > & __c) [inline]

Constructor, which initializes the ie_return_type with a list of deltas and the corresponding lists of weights and certificates.

Definition at line 136 of file ie_rettype.h.

10.147.2.13 coco::ie_return_type::ie_return_type (const delta_base * __d, double __w, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w, and the reason of termination ___t.

Definition at line 147 of file ie_rettype.h.

10.147.2.14 coco::ie_return_type::ie_return_type (const delta_base * __d, double __w, const certificate_base * __c, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w and certificate ___c, and the reason of termination ___t.

Definition at line 155 of file ie_rettype.h.

10.147.2.15 coco::ie_return_type::ie_return_type (const std::pair< delta_base *, double > & __d, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta and the corresponding weight collected in a pair ___d, and the reason of termination ___t.

Definition at line 163 of file ie_rettype.h.

10.147.2.16 coco::ie_return_type::ie_return_type (const std::triple< delta_base *, double, certificate_base * > & __d, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta, the corresponding weight and certificate collected in a triple ___d, and the reason of termination ___t.

Definition at line 171 of file ie_rettype.h.

10.147.2.17 coco::ie_return_type::ie_return_type (delta __d, double __w, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w, and the reason of termination ___t.

Definition at line 179 of file ie_rettype.h.

10.147.2.18 coco::ie_return_type::ie_return_type (delta __d, double __w, certificate __c, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta ___d, the corresponding weight ___w and certificate ___c, and the reason of termination ___t.

Definition at line 186 of file ie_rettype.h.

10.147.2.19 coco::ie_return_type::ie_return_type (const std::pair< delta, double > & __d, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta and the corresponding weight collected in a pair ___d, and the reason of termination ___t.

Definition at line 194 of file ie_rettype.h.

10.147.2.20 coco::ie_return_type::ie_return_type (const std::triple< delta, double, certificate > & __d, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with one delta, the corresponding weight and certificate collected in a triple ___d, and the reason of termination ___t.

Definition at line 201 of file ie_rettype.h.

10.147.2.21 coco::ie_return_type::ie_return_type (const std::list< delta > & __d, const std::list< double > & __w, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with a list of deltas and the corresponding list of weights, and the reason of termination ___t.

Definition at line 208 of file ie_rettype.h.

10.147.2.22 coco::ie_return_type::ie_return_type (const std::list< delta > & __d, const std::list< double > & __w, const std::list< certificate > & __c, const termination_reason & __t) [inline]

Constructor, which initializes the ie_return_type with a list of deltas and the corresponding lists of weights and certificates, and the reason of termination ___t.

Definition at line 222 of file ie_rettype.h.

10.147.2.23 coco::ie_return_type::ie_return_type (const ie_return_type & __r) [inline]

Standard Copy Constructor

Definition at line 233 of file ie_rettype.h.

10.147.2.24 virtual coco::ie_return_type::~ie_return_type ( ) [inline, virtual]

Standard Destructor

Definition at line 238 of file ie_rettype.h.

10.147.3 Member Function Documentation

10.147.3.1 const std::list< delta_id > & coco::ie_return_type::get (work_node & wn, double thresh = -COCO_INF)

This method gets all deltas with weight greater or equal thresh. A delta can be got at most once from any of and . The method converts and stores the delta in the deltas table of the search database. A second call to get or getd returns only deltas which have not previously been got. The work_node wn becomes the **keeper** work node of the retrieved deltas.

Definition at line 34 of file ie_rettype.cc.

10.147.3.2 const info_contents & coco::ie_return_type::get_info ( ) const [inline]

This method accesses the whole info content.

Definition at line 35 of file ie_rettype.hpp.

10.147.3.3 void coco::ie_return_type::getd (std::list< delta > & dels, std::list< certificate > & certl, double thresh)

This method gets all deltas with weight greater or equal thresh. A delta can be got at most once from any of and . A second call to either of get and returns only deltas which have not previously been got. The deltas and corresponding certificates are appended to the lists dels and certs, respectively.

Definition at line 74 of file ie_rettype.cc.

10.147.3.4 bool coco::ie_return_type::has_information (const std::string & __s) const [inline]

This method checks whether the variable iname is defined in the information structure.

Definition at line 168 of file ie_rettype.hpp.

10.147.3.5 bool coco::ie_return_type::has_information (const char * __s) const [inline]

This method checks whether the variable iname is defined in the information structure.

Definition at line 173 of file ie_rettype.hpp.

10.147.3.6 bool coco::ie_return_type::has_information (const std::string & __s, int i) const [inline]

This method checks whether the variable iname with index i is defined in the information structure.

Definition at line 178 of file ie_rettype.hpp.

10.147.3.7 bool coco::ie_return_type::has_information (const char * __s, int i) const [inline]

This method checks whether the variable iname with index i is defined in the information structure.

Definition at line 183 of file ie_rettype.hpp.

10.147.3.8 const basic_alltype & coco::ie_return_type::information (const std::string & iname) const [inline]

This method retrieves the value of the variable iname from the information structure.

Definition at line 144 of file ie_rettype.hpp.

10.147.3.9 const basic_alltype & coco::ie_return_type::information (const char * iname) const [inline]

This method retrieves the value of the variable iname from the information structure.

Definition at line 150 of file ie_rettype.hpp.

10.147.3.10 const basic_alltype & coco::ie_return_type::information (const std::string & iname, int i) const [inline]

This method retrieves the value of the variable iname with index i from the information structure.

Definition at line 156 of file ie_rettype.hpp.

10.147.3.11 const basic_alltype & coco::ie_return_type::information (const char * iname, int i) const [inline]

This method retrieves the value of the variable iname with index i from the information structure.

Definition at line 162 of file ie_rettype.hpp.

10.147.3.12 bool coco::ie_return_type::information_indices_set (const std::string & __s, std::vector< int > & __idx) const [inline]

The information_indices_set methods set __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 188 of file ie_rettype.hpp.

10.147.3.13 bool coco::ie_return_type::information_indices_set (const char * __s, std::vector< int > & __idx) const [inline]

The information_indices_set methods set ___idx to the list of indices defined for the variable with name ___s. The methods return whether the variable ___s is defined.

Definition at line 194 of file ie_rettype.hpp.

10.147.3.14 unsigned int coco::ie_return_type::n_deltas ( ) const [inline]

This method returns the number of deltas defined.

Definition at line 544 of file ie_rettype.h.

10.147.3.15 ie_return_type coco::ie_return_type::operator+ (const std::pair< delta_base *, double > & __d) [inline]

This operator adds another delta with weight to the ie_return_type.

Definition at line 50 of file ie_rettype.hpp.

10.147.3.16 ie_return_type coco::ie_return_type::operator+ (const std::triple< delta_base *, double, certificate_base * > & __d) [inline]

This operator adds another delta with weight and certificate to the ie_return_type.

Definition at line 71 of file ie_rettype.hpp.

10.147.3.17 ie_return_type & coco::ie_return_type::operator+= (const std::pair< delta_base *, double > & __d) [inline]

This operator increments the ie_return_type with another delta with weight.

Definition at line 60 of file ie_rettype.hpp.

10.147.3.18 ie_return_type & coco::ie_return_type::operator+= (const std::triple< delta_base *, double, certificate_base * > & __d) [inline]

This operator increments the ie_return_type with another delta with weight and certificate.

Definition at line 81 of file ie_rettype.hpp.

10.147.3.19 ie_return_type & coco::ie_return_type::operator= (const ie_return_type & __d) [inline]

Standard Assignment Operator

Definition at line 107 of file ie_rettype.hpp.

10.147.3.20 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const std::vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for

the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 221 of file ie_rettype.hpp.

10.147.3.21 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::sparse_vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 228 of file ie_rettype.hpp.

10.147.3.22 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::dense_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 235 of file ie_rettype.hpp.

10.147.3.23 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::sparse_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 242 of file ie_rettype.hpp.

10.147.3.24 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, _TS & __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 249 of file ie_rettype.hpp.

10.147.3.25 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const std::vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 294 of file ie_rettype.hpp.

10.147.3.26 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::sparse_vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 301 of file ie_rettype.hpp.

10.147.3.27 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::dense_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 308 of file ie_rettype.hpp.

10.147.3.28 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::sparse_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 315 of file ie_rettype.hpp.

10.147.3.29 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, _TS & __b) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 322 of file ie_rettype.hpp.

10.147.3.30 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 256 of file ie_rettype.hpp.

10.147.3.31 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 263 of file ie_rettype.hpp.

10.147.3.32 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 271 of file ie_rettype.hpp.

10.147.3.33 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 279 of file ie_rettype.hpp.

10.147.3.34 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const std::string & __s, _TS & __b, const _TS & __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 287 of file ie_rettype.hpp.

10.147.3.35 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const std::vector< _TS > *& __b, const std::vector< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 328 of file ie_rettype.hpp.

10.147.3.36 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::sparse_vector< _TS > *& __b, const vmtl::sparse_vector< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 335 of file ie_rettype.hpp.

10.147.3.37 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 343 of file ie_rettype.hpp.

10.147.3.38 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 351 of file ie_rettype.hpp.

10.147.3.39 template<class _TS > bool coco::ie_return_type::retrieve_from_info (const char * __s, _TS & __b, const _TS & __def) const [inline]

The retrieve_from_info method stores the contents of variable __s of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 359 of file ie_rettype.hpp.

10.147.3.40 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const std::string & __s, int i, const std::vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s with index i of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned

but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 366 of file ie_rettype.hpp.

10.147.3.41 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const std::string & __s, int i, const vmtl::sparse_vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s with index i of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 373 of file ie_rettype.hpp.

10.147.3.42 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const std::string & __s, int i, const vmtl::dense_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s with index i of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 380 of file ie_rettype.hpp.

10.147.3.43 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const std::string & __s, int i, const vmtl::sparse_matrix< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s with index i of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 387 of file ie_rettype.hpp.

10.147.3.44 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const std::string & __s, int i, _TS & __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s with index i of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 394 of file ie_rettype.hpp.

10.147.3.45 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const char * __s, int i, const std::vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable ___s with index i of the information structure in ___b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 439 of file ie_rettype.hpp.

10.147.3.46 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const char * __s, int i, const vmtl::sparse_vector< _TS > *& __b) const [inline]

The retrieve_from_info method stores the contents of variable __s with index i of the information structure in __b. If the variable is undefined the method returns false. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations.

Definition at line 446 of file ie_rettype.hpp.

Definition at line 481 of file ie_rettype.hpp.

10.147.3.57 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const char * __s, int i, const vmtl::dense_matrix< _TS > *& __b, const vmtl::dense_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s with index i of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 489 of file ie_rettype.hpp.

10.147.3.58 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const char * __s, int i, const vmtl::sparse_matrix< _TS > *& __b, const vmtl::sparse_matrix< _TS > * __def) const [inline]

The retrieve_from_info method stores the contents of variable __s with index i of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 497 of file ie_rettype.hpp.

10.147.3.59 template<class _TS > bool coco::ie_return_type::retrieve_from_info_i (const char * __s, int i, _TS & __b, const _TS & __def) const [inline]

The retrieve_from_info method stores the contents of variable __s with index i of the information structure in __b. If the variable is undefined the method assigns the default value __def to __b. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the information structure, in order to reduce unnecessary big copy operations. The method returns true if any assignment to __b was successful.

Definition at line 505 of file ie_rettype.hpp.

10.147.3.60 bool coco::ie_return_type::set_information (const std::string & iname, const basic_alltype & a, bool force = false) [inline]

This method sets the variable iname in the information structure to a. If force is true the variable will be overwritten if it is already set. The method returns whether the set operation was successful.

Definition at line 120 of file ie_rettype.hpp.

10.147.3.61 bool coco::ie_return_type::set_information (const char * *iname*, const basic_alltype & *a*, bool *force* = false) [inline]

This method sets the variable iname in the information structure to a. If force is true the variable will be overwritten if it is already set. The method returns whether the set operation was successful.

Definition at line 126 of file ie_rettype.hpp.

10.147.3.62 bool coco::ie_return_type::set_information_i (const std::string & *iname*, int *i*, const basic_alltype & *a*, bool *force* = false) [inline]

This method sets the variable iname with index i in the information structure to a. If force is true the variable will be overwritten if it is already set. The method returns whether the set operation was successful.

Definition at line 132 of file ie_rettype.hpp.

10.147.3.63 bool coco::ie_return_type::set_information_i (const char * *iname*, int *i*, const basic_alltype & *a*, bool *force* = false) [inline]

This method sets the variable iname with index i in the information structure to a. If force is true the variable will be overwritten if it is already set. The method returns whether the set operation was successful.

Definition at line 138 of file ie_rettype.hpp.

10.147.3.64 void coco::ie_return_type::set_termination_reason (const termination_reason & *__t*) [inline]

This method sets the termination_reason to __t.

Definition at line 40 of file ie_rettype.hpp.

10.147.3.65 const termination_reason & coco::ie_return_type::term_reason ( ) const [inline]

This method returns the reason of termination.

Definition at line 45 of file ie_rettype.hpp.

10.147.3.66 void coco::ie_return_type::unset_information (const std::string & *__s*) [inline]

This method removes the variable __s from the information structure.

Definition at line 200 of file ie_rettype.hpp.

10.147.3.67 void coco::ie_return_type::unset_information (const char * *__s*) [inline]

This method removes the variable __s from the information structure.

Definition at line 205 of file ie_rettype.hpp.

10.147.3.68 void coco::ie_return_type::unset_information (const std::string & *__s*, int *i*) [inline]

This method removes the variable __s with index i from the information structure.

Definition at line 210 of file ie_rettype.hpp.

10.147.3.69 void coco::ie_return_type::unset_information (const char * __s, int i) [inline]

This method removes the variable __s with index i from the information structure.

Definition at line 215 of file ie_rettype.hpp.

The documentation for this class was generated from the following files:

10.148.1 Member Typedef Documentation

10.148.1.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.148.1.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.148.1.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.148.2 Constructor & Destructor Documentation

10.148.2.1 coco::ihessBackwardEvaluator::ihessBackwardEvaluator (std::vector< std::vector< interval > > * __der_data, std::vector< std::vector< interval > > * __hess_data, variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > * __d, std::vector< std::vector< interval > > * __h, std::vector< interval > * __grad, std::vector< interval > * __hess) [inline]

Definition at line 1444 of file ihess_evaluator.h.

10.148.2.2 coco::ihessBackwardEvaluator::ihessBackwardEvaluator (const ihessBackwardEvaluator & __he) [inline]

Definition at line 1474 of file ihess_evaluator.h.

10.148.2.3 coco::ihessBackwardEvaluator::~ihessBackwardEvaluator ( ) [inline]

Definition at line 1476 of file ihess_evaluator.h.

10.148.3 Member Function Documentation

10.148.3.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.148.3.2 int coco::ihessBackwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 1516 of file ihess_evaluator.h.

10.148.3.3 bool coco::ihessBackwardEvaluator::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< ihessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1755 of file ihess_evaluator.h.

10.148.3.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.148.3.5 void coco::ihessBackwardEvaluator::cleanup (const expression_node & __data) [inline]

Definition at line 1653 of file ihess_evaluator.h.

10.148.3.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.148.3.7 void coco::ihessBackwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< ihessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1505 of file ihess_evaluator.h.

10.148.3.8 bool coco::ihessBackwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< ihessBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1431 of file ihess_evaluator.h.

10.148.3.9 void coco::ihessBackwardEvaluator::newPoint (std::vector< std::vector< interval > > * __der_data, std::vector< std::vector< interval > > * __hess_data, const variable_indicator & __v) [inline]

Definition at line 1478 of file ihess_evaluator.h.

10.148.3.10 void coco::ihessBackwardEvaluator::newResult (std::vector< interval > * __grad, std::vector< interval > * __hess) [inline]

Definition at line 1488 of file ihess_evaluator.h.

10.148.3.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.148.3.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.148.3.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.148.3.14 void coco::ihessBackwardEvaluator::set_mult (interval scal) [inline]

Definition at line 1494 of file ihess_evaluator.h.

10.148.3.15 expression_const_walker coco::ihessBackwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 1501 of file ihess_evaluator.h.

10.148.3.16 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.148.3.17 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.148.3.18 int coco::ihessBackwardEvaluator::update (const bool & *__rval*) [inline]

Definition at line 1691 of file ihess_evaluator.h.

10.148.3.19 int coco::ihessBackwardEvaluator::update (const expression_node & *__data*, const bool & *__rval*) [inline]

Definition at line 1701 of file ihess_evaluator.h.

10.148.3.20 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.148.3.21 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.148.3.22 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.148.3.23 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.150.1 Member Typedef Documentation

10.150.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.150.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.150.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.150.2 Constructor & Destructor Documentation

10.150.2.1 coco::ihessForwardEvaluator::ihessForwardEvaluator (const std::vector< diffI > & __x, const std::vector< interval > & __rg, const variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > & __d, std::vector< std::vector< interval > > & __h, std::vector< diffI > * __c, bool *inters* = true, const std::vector< interval > * *_center* = NULL) [inline]

Definition at line 254 of file ihess_evaluator.h.

10.150.2.2 coco::ihessForwardEvaluator::ihessForwardEvaluator (const ihessForwardEvaluator & __x) [inline]

Definition at line 298 of file ihess_evaluator.h.

10.150.2.3 coco::ihessForwardEvaluator::~ihessForwardEvaluator ( ) [inline]

Definition at line 302 of file ihess_evaluator.h.

10.150.3 Member Function Documentation

10.150.3.1 void coco::ihessForwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 437 of file ihess_evaluator.h.

10.150.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.150.3.3 ihessForwardEvaluatorReturnValue coco::ihessForwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< ihessForwardEvaluatorType, expression_node, ihessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 1391 of file ihess_evaluator.h.

10.150.3.4 void coco::ihessForwardEvaluator::changeIntersectBehaviour (bool *intersect*) [inline]

Definition at line 346 of file ihess_evaluator.h.

10.150.3.5 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.150.3.6 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.150.3.7 void coco::ihessForwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< ihessForwardEvaluatorType, expression_node, ihessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 351 of file ihess_evaluator.h.

10.150.3.8 int coco::ihessForwardEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 360 of file ihess_evaluator.h.

10.150.3.9 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.150.3.10 bool coco::ihessForwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< ihessForwardEvaluatorType, expression_node, ihessForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 181 of file ihess_evaluator.h.

10.150.3.11 void coco::ihessForwardEvaluator::newCenter (const std::vector< interval > * _center) [inline]

This method changes the center for centered forms to _center.

Definition at line 341 of file ihess_evaluator.h.

10.150.3.12 void coco::ihessForwardEvaluator::newPoint (const std::vector< diffI > & __x, const variable_indicator & __v) [inline]

Definition at line 307 of file ihess_evaluator.h.

10.150.3.13 void coco::ihessForwardEvaluator::newRange (const std::vector< interval > & __rg, const variable_indicator & __v) [inline]

This method changes the node ranges to ___rg. The parameter * ___v specifies which variables have changed value since the last * evaluation.

Definition at line 334 of file ihess_evaluator.h.

10.150.3.14 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.150.3.15 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.150.3.16 void coco::ihessForwardEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 448 of file ihess_evaluator.h.

10.150.3.17 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.150.3.18 expression_const_walker coco::ihessForwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 304 of file ihess_evaluator.h.

10.150.3.19 int coco::ihessForwardEvaluator::update (const diffI & __rval) [inline]

Definition at line 455 of file ihess_evaluator.h.

10.150.3.20 int coco::ihessForwardEvaluator::update (const expression_node & *__data*, const ihessForwardEvaluatorReturnValue & *__rval*) [inline]

Definition at line 465 of file ihess_evaluator.h.

10.150.3.21 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.150.3.22 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.150.3.23 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.150.3.24 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.150.3.25 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.150.3.26 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.154.3.6 void coco::ihessPreparationEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< ihessPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 108 of file ihess_evaluator.h.

10.154.3.7 int coco::ihessPreparationEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 117 of file ihess_evaluator.h.

10.154.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.154.3.9 bool coco::ihessPreparationEvaluator::is_cached (const expression_node & __data) [inline]

Definition at line 110 of file ihess_evaluator.h.

10.154.3.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.154.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.154.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.154.3.13 void coco::ihessPreparationEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 115 of file ihess_evaluator.h.

10.154.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.154.3.15 int coco::ihessPreparationEvaluator::update (bool __rval) [inline]

Definition at line 129 of file ihess_evaluator.h.

10.154.3.16 int coco::ihessPreparationEvaluator::update (const expression_node & __data, bool __rval) [inline]

Definition at line 131 of file ihess_evaluator.h.

10.154.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.154.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.154.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.154.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.154.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.154.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.156.1 Member Typedef Documentation

10.156.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.156.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.156.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.156.2 Constructor & Destructor Documentation

10.156.2.1 coco::infbound_eval::infbound_eval (const std::vector< infbound > & __x, const variable_indicator & __v, const model & __m, std::vector< infbound > * __c) [inline]

Definition at line 116 of file infb_evaluator.h.

10.156.2.2 coco::infbound_eval::infbound_eval (const infbound_eval & __v) [inline]

Definition at line 128 of file infb_evaluator.h.

10.156.2.3 coco::infbound_eval::~infbound_eval ( ) [inline]

Definition at line 130 of file infb_evaluator.h.

10.156.3 Member Function Documentation

10.156.3.1 void coco::infbound_eval::calculate (const expression_node & __data) [inline]

Definition at line 193 of file infb_evaluator.h.

10.156.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.156.3.3 infbound coco::infbound_eval::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< infbound_eval_type, expression_node, infbound, expression_const_walker >.

Definition at line 709 of file infb_evaluator.h.

10.156.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.156.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.156.3.6 void coco::infbound_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< infbound_eval_type, expression_node, infbound, expression_const_walker >.

Definition at line 135 of file infb_evaluator.h.

10.156.3.7 int coco::infbound_eval::initialize (const expression_node & *__data*) [inline]

Definition at line 137 of file infb_evaluator.h.

10.156.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.156.3.9 bool coco::infbound_eval::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< infbound_eval_type, expression_node, infbound, expression_const_walker >.

Definition at line 70 of file infb_evaluator.h.

10.156.3.10 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.156.3.11 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.156.3.12 void coco::infbound_eval::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 205 of file infb_evaluator.h.

10.156.3.13 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.156.3.14 expression_const_walker coco::infbound_eval::short_cut_to (const expression_node & __data) [inline]

Definition at line 132 of file infb_evaluator.h.

10.156.3.15 int coco::infbound_eval::update (const infbound & __rval) [inline]

Definition at line 221 of file infb_evaluator.h.

10.156.3.16 int coco::infbound_eval::update (const expression_node & __data, const infbound & __rval) [inline]

Definition at line 227 of file infb_evaluator.h.

10.156.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.156.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.156.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.156.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.156.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.156.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.158.1 Detailed Description

This class is used to mark a model as infeasible.

10.158.2 Constructor & Destructor Documentation

10.158.2.1 coco::infeasible_delta::infeasible_delta ( ) [inline]

Standard Constructor

Definition at line 85 of file infeasible_delta.h.

10.158.2.2 coco::infeasible_delta::infeasible_delta (const infeasible_delta & __d) [inline]

Standard Copy Constructor

Definition at line 87 of file infeasible_delta.h.

10.158.2.3 coco::infeasible_delta::~infeasible_delta ( ) [inline]

Standard Destructor

Definition at line 95 of file infeasible_delta.h.

10.158.3 Member Function Documentation

10.158.3.1 bool coco::infeasible_delta::apply (work_node & _x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const [inline]

Apply the delta with delta_id _d to work node _x, hereby marking the model as infeasible.

Definition at line 104 of file infeasible_delta.h.

10.158.3.2 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.158.3.3 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.158.3.4 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.158.3.5 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & *delta_size*) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.158.3.6 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.158.3.7 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.158.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.158.3.9 void coco::infeasible_delta::destroy_copy (delta_base * __d) const [inline]

Clone Destructor

Definition at line 100 of file infeasible_delta.h.

10.158.3.10 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.158.3.11 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.158.3.12 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.158.3.13 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.158.3.14 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.158.3.15 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.158.3.16 infeasible_delta* coco::infeasible_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Definition at line 98 of file infeasible_delta.h.

10.158.3.17 bool coco::infeasible_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 116 of file infeasible_delta.h.

10.158.3.18 bool coco::infeasible_delta::operator!= (const infeasible_delta & *_c*) const [inline]

Definition at line 122 of file infeasible_delta.h.

10.158.3.19 bool coco::infeasible_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Definition at line 113 of file infeasible_delta.h.

10.158.3.20 bool coco::infeasible_delta::operator== (const infeasible_delta & _c) const [inline]

Comparison operators

Definition at line 121 of file infeasible_delta.h.

10.158.3.21 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.158.3.22 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.158.3.23 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.158.4 Member Data Documentation

10.158.4.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

10.160.1 Detailed Description

This is the base class of all COCONUT inference engine modules. An inference engine is an inference module, which specializes in analyzing a work node. Typical inference engines are, e.g., convexity analyzers, local solvers, incomplete global solvers,...

10.160.2 Constructor & Destructor Documentation

10.160.2.1 coco::inference_engine::inference_engine (const gptr< work_node > & *wnode,* const std::string & *__n,* inference_module_cache & *cache*) [inline]

This is the standard constructor for an inference_engine using the inference module cache. It sets the indentifier string to n, the work node to wnode and the cache to cache.

Definition at line 109 of file inference_engine.h.

10.160.2.2 coco::inference_engine::inference_engine (const gptr< work_node > & *wnode,* const std::string & *__n*) [inline]

This is the standard constructor for an inference_engine. It sets the indentifier string to n and the work node to wnode.

Definition at line 120 of file inference_engine.h.

10.160.2.3 virtual coco::inference_engine::~inference_engine ( ) [inline, virtual]

Standard Destructor

Definition at line 129 of file inference_engine.h.

10.160.3 Member Function Documentation

10.160.3.1 virtual statistic_info coco::inference_engine::cumulative_stat ( ) [inline, virtual]

This method returns the cumulative statistics gathered through all calls of the infer method.

Definition at line 168 of file inference_engine.h.

10.160.3.2 const delta* coco::inference_engine::get_delta (const delta_id & *__d*) const [inline]

The get_delta retrieves the delta with delta_id ___d.

Definition at line 145 of file inference_engine.h.

10.160.3.3 const model* coco::inference_engine::get_model ( ) const [inline]

A call to this method returns a pointer to the model of the work node.

Definition at line 149 of file inference_engine.h.

10.160.3.4 const std::string& coco::inference_engine::get_name ( ) const [inline]

The get_name method returns the identifier string of the inference engine.

Definition at line 161 of file inference_engine.h.

10.160.3.5 virtual ie_return_type coco::inference_engine::infer (const control_data & *__c*) [inline, virtual]

This method is the main method of an inference engine. It is supposed to analyze the work node and to return the information gained in the ie_return_type structure. This method is overloaded by the various

subclasses. Service information and parameters are provided via the control_data structure __c.

Definition at line 157 of file inference_engine.h.

10.160.3.6 virtual statistic_info coco::inference_engine::last_call_stat ( ) [inline, virtual]

This method returns the statistics gathered in the last call of the infer method.

Definition at line 165 of file inference_engine.h.

10.160.3.7 std::pair< std::list< delta_id >, std::list< delta_id > > coco::inference_engine::new_deltas ( )

This method returns the deltas to be applied and unapplied for properly updating the inference engine.

Definition at line 51 of file inference_engine.cc.

10.160.3.8 virtual bool coco::inference_engine::update_engine (const gptr< work_node > & *wnode*) [inline, virtual]

This update_engine method changes the work node to wnode.

Definition at line 132 of file inference_engine.h.

10.160.4 Friends And Related Function Documentation

10.160.4.1 friend class inference_module_cache [friend]

Definition at line 170 of file inference_engine.h.

10.160.5 Member Data Documentation

10.160.5.1 inference_module_cache* coco::inference_engine::__imc [protected]

This is the inference module cache used to store and retrieve data frequently used by various inference modules.

Definition at line 93 of file inference_engine.h.

10.160.5.2 std::string coco::inference_engine::__name [protected]

This is the identifier string for an inference engine.

Definition at line 83 of file inference_engine.h.

10.160.5.3 const vdbl::viewdbase& coco::inference_engine::__vdb [protected]

This is a view to the search database.

Definition at line 90 of file inference_engine.h.

10.160.5.4 const work_node_context* coco::inference_engine::__wnc [protected]

This is the work_node_context for extracting information from the search database.

Definition at line 88 of file inference_engine.h.

10.160.5.5 const gptr<work_node>* coco::inference_engine::__wnode [protected]

This variable contains a global pointer to the work node.

Definition at line 85 of file inference_engine.h.

10.160.5.6 std::vector<delta_id> coco::inference_engine::_new_deltas [protected]

This vector keeps the new deltas for updating an engine with a call to the update_engine method (these deltas need to be applied).

Definition at line 99 of file inference_engine.h.

10.160.5.7 std::vector<delta_id> coco::inference_engine::_old_deltas [protected]

This vector keeps the old deltas for updating an engine with a call to the update_engine method (these deltas need to be unapplied).

Definition at line 96 of file inference_engine.h.

The documentation for this class was generated from the following files:

- inference_engine.h
- inference_engine.cc

10.161.3 Member Function Documentation

10.161.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.161.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 238 of file comp_hook.h.

10.161.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 135 of file comp_hook.h.

10.161.3.4 bool coco::inference_engine_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the registered columns

Reimplemented from coco::wnc_hook_base.

Definition at line 415 of file infeng_hook.h.

10.161.3.5 bool coco::inference_engine_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the columns defined.

Reimplemented from coco::wnc_hook_base.

Definition at line 245 of file infeng_hook.h.

10.161.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.161.3.7 inference_engine_comp_hook* coco::inference_engine_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 91 of file infeng_hook.h.

10.161.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.161.3.9 void coco::inference_engine_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *add_ds* = NULL, std::list< certificate > * *add_cs* = NULL) const [inline, virtual]

The evaluation operator of this computation hook. It stores the lower and upper bounds on the objective function on the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 97 of file infeng_hook.h.

10.161.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

- search_node_id get_top_box_id () const

10.163.1 Detailed Description

This is the class keeping the cache for all COCONUT inference modules. This cache can be directly written to and read from in inference modules. Typical data stored in the cache are 1d function info, point evaluations at the center of a box, range enclosures over a box,...

10.163.2 Constructor & Destructor Documentation

10.163.2.1 coco::coco::inference_module_cache::inference_module_cache ( ) [inline]

This is the standard constructor for an inference_module_cache.

Definition at line 123 of file search_graph.cc.

10.163.2.2 coco::coco::inference_module_cache::inference_module_cache (const inference_module_cache & *ic,* bool *all* = true) [inline]

This is the standard constructor for an inference_module_cache.

Definition at line 133 of file search_graph.cc.

10.163.2.3 coco::coco::inference_module_cache::~inference_module_cache ( ) [inline]

Standard Destructor

Definition at line 141 of file search_graph.cc.

10.163.3 Member Function Documentation

10.163.3.1 bool coco::inference_module_cache::deregister_autogen_method (unsigned int *i,* unsigned int *cl*)

This method is used to deregister a new auto-generate method for class and entry `of` the inference module cache.

Definition at line 104 of file inf_module_cache.cc.

10.163.3.2 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* std::vector< _TS > *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`) [inline]

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 118 of file inf_module_cache.hpp.

10.163.3.3 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* vmtl::sparse_vector< _TS > *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`) [inline]

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 131 of file inf_module_cache.hpp.

10.163.3.4 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* vmtl::dense_matrix< _TS > *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`) [inline]

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 144 of file inf_module_cache.hpp.

10.163.3.5 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* vmtl::sparse_matrix< _TS > *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`) [inline]

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 157 of file inf_module_cache.hpp.

10.163.3.6 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* bool & *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`) [inline]

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 169 of file inf_module_cache.hpp.

10.163.3.7 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* int & *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 179 of file inf_module_cache.hpp.

10.163.3.8 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* unsigned int & *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 189 of file inf_module_cache.hpp.

10.163.3.9 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* double & *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 199 of file inf_module_cache.hpp.

10.163.3.10 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* interval & *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 209 of file inf_module_cache.hpp.

10.163.3.11 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* void *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 219 of file inf_module_cache.hpp.

10.163.3.12 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* std::string & *ret,* const gptr< work_node > & *wn,* bool *optimal* = false) [inline]

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 229 of file inf_module_cache.hpp.

10.163.3.13 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* basic_alltype *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

Definition at line 36 of file inf_module_cache.cc.

10.163.3.14 search_node_id coco::inference_module_cache::get_top_box_id ( ) const [inline]

This is the getter method for `top_box_id`.

Definition at line 239 of file inf_module_cache.hpp.

10.163.3.15 void coco::coco::inference_module_cache::invalidate (bool *for_subbox* = `false`) [inline]

This method invalidates the non-persistent part of the cache if `for_subbox` is `false`. Otherwise it only invalidates the thisbox part of the cache.

This method invalidates the non-persistent part of the cache.

Definition at line 53 of file inf_module_cache.hpp.

10.163.3.16 void coco::coco::inference_module_cache::invalidate_for_subbox ( ) [inline]

This method invalidates all parts of the cache which are neither persistent nor subbox.

Definition at line 71 of file inf_module_cache.hpp.

10.163.3.17 bool coco::inference_module_cache::register_autogen_method (unsigned int *i,* unsigned int *cl,* inference_module_cache_autogen * *mth*)

This method is used to register a new auto-generate method for class and entry `of` the inference module cache. Note that the methods MUST be generated by a call to new!

Definition at line 89 of file inf_module_cache.cc.

10.163.3.18 void coco::coco::inference_module_cache::set (unsigned int *i,* unsigned int *cl,* const basic_alltype & *val,* bool *thisbox*)

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

Definition at line 75 of file inf_module_cache.cc.

10.163.3.19 void coco::coco::inference_module_cache::set_from (const inference_module_cache & *im,* tristate *inval*) [inline]

This method sets the cache from `im`. If `inval` is `t_true`, the copied cache is invalidated, if it is `t_maybe` only the thisbox part is invalidated.

This method sets the persistent part of the cache and copies the registered methods.

Definition at line 35 of file inf_module_cache.hpp.

The documentation for this class was generated from the following files:

- inf_module_cache.h
- inf_module_cache.cc
- inf_module_cache.hpp

10.164 coco::inference_module_cache Class Reference

Inference module cache class.

Standard Destructor

Definition at line 141 of file inf_module_cache.h.

10.164.3 Member Function Documentation

10.164.3.1 bool coco::inference_module_cache::deregister_autogen_method (unsigned int *i*, unsigned int *cl*)

This method is used to deregister a new auto-generate method for class and entry of the inference module cache.

10.164.3.2 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i*, unsigned int *cl*, std::vector< _TS > *& *ret*, const gptr< work_node > & *wn*, bool *optimal* = false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.3 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i*, unsigned int *cl*, vmtl::sparse_vector< _TS > *& *ret*, const gptr< work_node > & *wn*, bool *optimal* = false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.4 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* vmtl::dense_matrix< _TS > *&* *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.5 template<class _TS > tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* vmtl::sparse_matrix< _TS > *&* *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.6 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* bool & *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.7 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* int & *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.8 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* unsigned int & *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.9 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* double & *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.10 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* interval & *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.11 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* void *&* *ret,* const gptr< work_node > & *wn,* bool *optimal =* false)

This method retrieves the information in entry i of the persistent cache in ret. It returns whether it was successful.

10.164.3.12 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* std::string & *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`)

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

10.164.3.13 tristate coco::inference_module_cache::get (unsigned int *i,* unsigned int *cl,* basic_alltype *& *ret,* const gptr< work_node > & *wn,* bool *optimal* = `false`)

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

10.164.3.14 search_node_id coco::inference_module_cache::get_top_box_id ( ) const

This is the getter method for `top_box_id`.

10.164.3.15 void coco::inference_module_cache::invalidate (bool *for_subbox* = `false`)

This method invalidates the non-persistent part of the cache if `for_subbox` is `false`. Otherwise it only invalidates the thisbox part of the cache.

10.164.3.16 void coco::inference_module_cache::invalidate_for_subbox ( )

This method invalidates all parts of the cache which are neither persistent nor subbox.

10.164.3.17 bool coco::inference_module_cache::register_autogen_method (unsigned int *i,* unsigned int *cl,* inference_module_cache_autogen * *mth*)

This method is used to register a new auto-generate method for class and entry `of` the inference module cache. Note that the methods MUST be generated by a call to new!

10.164.3.18 void coco::inference_module_cache::set (unsigned int *i,* unsigned int *cl,* const basic_alltype & *ret,* bool *thisbox*)

This method retrieves the information in entry `i` of the persistent cache in ret. It returns whether it was successful.

10.164.3.19 void coco::inference_module_cache::set_from (const inference_module_cache & *im,* tristate *inval*)

This method sets the cache from `im`. If `inval` is `t_true`, the copied cache is invalidated, if it is `t_maybe` only the thisbox part is invalidated.

The documentation for this class was generated from the following file:

- inf_module_cache.h

10.165 coco::inference_module_cache_autogen Class Reference

Inference module cache auto-generate method base class.

`#include <inf_module_cache.h>`

Public Member Functions

- virtual bool operator() (inference_module_cache &imc, unsigned int i, unsigned int cl, const gptr< work_node > &wn)=0
- virtual ~inference_module_cache_autogen ()

10.165.1 Detailed Description

This is the base class for auto-generate methods of the inference module cache. All methods must be derived from this base class. They can then be registered in the cache.

10.165.2 Constructor & Destructor Documentation

10.165.2.1 virtual coco::inference_module_cache_autogen::~inference_module_cache_autogen ( ) [inline, virtual]

Definition at line 62 of file inf_module_cache.h.

10.165.3 Member Function Documentation

10.165.3.1 virtual bool coco::inference_module_cache_autogen::operator() (inference_module_cache & *imc,* unsigned int *i,* unsigned int *cl,* const gptr< work_node > & *wn*) [pure virtual]

This module will be called to automatically to regenerate information for the inference module cache.

The documentation for this class was generated from the following file:

- inf_module_cache.h

10.166 coco::coco::inference_module_cache_autogen Class Reference

Inference module cache auto-generate method base class.

Public Member Functions

- virtual bool operator() (inference_module_cache &imc, unsigned int i, unsigned int cl, const gptr< work_node > &wn)=0
- virtual ~inference_module_cache_autogen ()

10.166.1 Detailed Description

This is the base class for auto-generate methods of the inference module cache. All methods must be derived from this base class. They can then be registered in the cache.

10.166.2 Constructor & Destructor Documentation

10.166.2.1 virtual coco::coco::inference_module_cache_autogen::~inference_module_cache_autogen ( ) [inline, virtual]

Definition at line 62 of file search_graph.cc.

10.166.3 Member Function Documentation

10.166.3.1 virtual bool coco::coco::inference_module_cache_autogen::operator() (inference_module_cache & *imc,* unsigned int *i,* unsigned int *cl,* const gptr< work_node > & *wn*) [pure virtual]

This module will be called to automatically to regenerate information for the inference module cache.

The documentation for this class was generated from the following file:

- inf_module_cache.h

10.167 coco::info_contents Class Reference

The class for returning additional information from inference modules.

10.167.1 Detailed Description

This class is used for returning additional information from inference modules. It is basically a datamap.

10.167.2 Constructor & Destructor Documentation

10.167.2.1 coco::info_contents::info_contents ( ) [inline]

Standard Constructor

Definition at line 50 of file info_contents.h.

10.167.2.2 coco::info_contents::info_contents (const std::string & *__n*, const basic_alltype & *__v*) [inline]

Constructor setting the variable __n to value __v.

Definition at line 52 of file info_contents.h.

10.167.2.3 coco::info_contents::info_contents (const char * *__n*, const basic_alltype & *__v*) [inline]

Constructor setting the variable __n to value __v.

Definition at line 55 of file info_contents.h.

10.167.2.4 coco::info_contents::info_contents (const info_contents & __c) [inline]

Standard Copy Constructor

Definition at line 58 of file info_contents.h.

10.167.2.5 virtual coco::info_contents::~info_contents ( ) [inline, virtual]

Standard Destructor

Definition at line 60 of file info_contents.h.

10.167.3 Member Function Documentation

10.167.3.1 bool coco::datamap::defd (const std::string & __s) const [inline, inherited]

This method returns whether the variable with name __s is defined.

Definition at line 109 of file datamap.hpp.

10.167.3.2 bool coco::datamap::defd (const char * __s) const [inline, inherited]

This method returns whether the variable with name __s is defined.

Definition at line 114 of file datamap.hpp.

10.167.3.3 bool coco::datamap::defd (const std::string & __s, int i) const [inline, inherited]

This method returns whether the variable with name __s and index is defined.

Definition at line 119 of file datamap.hpp.

10.167.3.4 bool coco::datamap::defd (const char * __s, int i) const [inline, inherited]

This method returns whether the variable with name __s and index is defined.

Definition at line 124 of file datamap.hpp.

10.167.3.5 void coco::datamap::list (std::vector< std::string > & __v) const [inherited]

The list method sets __v to the list of entry keys stored in this datamap.

Reimplemented in coco::control_data.

Definition at line 101 of file datamap.cc.

10.167.3.6 info_contents& coco::info_contents::operator= (const info_contents & __c) [inline]

Standard Assignment Operator

Definition at line 63 of file info_contents.h.

10.167.3.7 void coco::datamap::remove (const std::string & __s) [inline, inherited]

The remove methods remove the variable with name ___s from the datamap.

Definition at line 57 of file datamap.hpp.

10.167.3.8 void coco::datamap::remove (const char * __s) [inline, inherited]

The remove methods remove the variable with name ___s from the datamap.

Definition at line 65 of file datamap.hpp.

10.167.3.9 void coco::datamap::remove (const std::string & __s, int i) [inline, inherited]

The remove methods remove the variable with name ___s and index i from the datamap.

Definition at line 70 of file datamap.hpp.

10.167.3.10 void coco::datamap::remove (const char * __s, int i) [inline, inherited]

The remove methods remove the variable with name ___s and index i from the datamap.

Definition at line 76 of file datamap.hpp.

10.167.3.11 bool coco::datamap::retrieve (const std::string & __s, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable ___s to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 149 of file datamap.hpp.

10.167.3.12 bool coco::datamap::retrieve (const std::string & __s, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable ___s to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 169 of file datamap.hpp.

10.167.3.13 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable ___s to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 191 of file datamap.hpp.

10.167.3.14 bool coco::datamap::retrieve (const std::string & __s, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable ___s to the variable ___v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to

the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 213 of file datamap.hpp.

10.167.3.15 bool coco::datamap::retrieve (const std::string & __s, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 235 of file datamap.hpp.

10.167.3.16 bool coco::datamap::retrieve (const std::string & __s, std::string & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 257 of file datamap.hpp.

10.167.3.17 bool coco::datamap::retrieve (const std::string & __s, num::Number & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 279 of file datamap.hpp.

10.167.3.18 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 301 of file datamap.hpp.

10.167.3.19 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 323 of file datamap.hpp.

10.167.3.20 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 345 of file datamap.hpp.

10.167.3.21 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 367 of file datamap.hpp.

10.167.3.22 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 389 of file datamap.hpp.

10.167.3.23 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 411 of file datamap.hpp.

10.167.3.24 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 433 of file datamap.hpp.

10.167.3.25 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 455 of file datamap.hpp.

10.167.3.26 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 477 of file datamap.hpp.

10.167.3.27 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 499 of file datamap.hpp.

10.167.3.28 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 521 of file datamap.hpp.

10.167.3.29 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 543 of file datamap.hpp.

10.167.3.30 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 565 of file datamap.hpp.

10.167.3.31 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 587 of file datamap.hpp.

10.167.3.32 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 609 of file datamap.hpp.

10.167.3.33 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 631 of file datamap.hpp.

10.167.3.34 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 653 of file datamap.hpp.

10.167.3.35 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 675 of file datamap.hpp.

10.167.3.36 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 697 of file datamap.hpp.

10.167.3.37 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 719 of file datamap.hpp.

10.167.3.38 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 741 of file datamap.hpp.

10.167.3.39 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 763 of file datamap.hpp.

10.167.3.40 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 785 of file datamap.hpp.

10.167.3.41 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 807 of file datamap.hpp.

10.167.3.42 bool coco::datamap::retrieve (const char * __s, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 829 of file datamap.hpp.

10.167.3.43 bool coco::datamap::retrieve (const char * __s, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 839 of file datamap.hpp.

10.167.3.44 bool coco::datamap::retrieve (const char * __s, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 849 of file datamap.hpp.

10.167.3.45 bool coco::datamap::retrieve (const char * __s, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 859 of file datamap.hpp.

10.167.3.46 bool coco::datamap::retrieve (const char * __s, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 869 of file datamap.hpp.

10.167.3.47 bool coco::datamap::retrieve (const char * __s, std::string & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 879 of file datamap.hpp.

10.167.3.48 bool coco::datamap::retrieve (const char * __s, num::Number & __is) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 889 of file datamap.hpp.

10.167.3.49 bool coco::datamap::retrieve (const char * __s, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 899 of file datamap.hpp.

10.167.3.50 bool coco::datamap::retrieve (const char * __s, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 919 of file datamap.hpp.

10.167.3.51 bool coco::datamap::retrieve (const char * __s, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 909 of file datamap.hpp.

10.167.3.52 bool coco::datamap::retrieve (const char * __s, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 929 of file datamap.hpp.

10.167.3.53 bool coco::datamap::retrieve (const char * __s, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 939 of file datamap.hpp.

10.167.3.54 bool coco::datamap::retrieve (const char * __s, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 949 of file datamap.hpp.

10.167.3.55 bool coco::datamap::retrieve (const char * __s, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 959 of file datamap.hpp.

10.167.3.56 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 969 of file datamap.hpp.

10.167.3.57 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 989 of file datamap.hpp.

10.167.3.58 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 979 of file datamap.hpp.

10.167.3.59 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 999 of file datamap.hpp.

10.167.3.60 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1009 of file datamap.hpp.

10.167.3.61 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1019 of file datamap.hpp.

10.167.3.62 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1029 of file datamap.hpp.

10.167.3.63 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1039 of file datamap.hpp.

10.167.3.64 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1050 of file datamap.hpp.

10.167.3.65 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1061 of file datamap.hpp.

10.167.3.66 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1072 of file datamap.hpp.

10.167.3.67 bool coco::datamap::retrieve (const char * __s, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1083 of file datamap.hpp.

10.167.3.68 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1094 of file datamap.hpp.

10.167.3.69 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1105 of file datamap.hpp.

10.167.3.70 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1116 of file datamap.hpp.

10.167.3.71 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1127 of file datamap.hpp.

10.167.3.72 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1138 of file datamap.hpp.

10.167.3.73 bool coco::datamap::retrieve (const std::string & __s, bool & __v, bool __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 159 of file datamap.hpp.

10.167.3.74 bool coco::datamap::retrieve (const std::string & __s, int & __v, int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 181 of file datamap.hpp.

10.167.3.75 bool coco::datamap::retrieve (const std::string & __s, unsigned int & __v, unsigned int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 203 of file datamap.hpp.

10.167.3.76 bool coco::datamap::retrieve (const std::string & __s, double & __v, double __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 225 of file datamap.hpp.

10.167.3.77 bool coco::datamap::retrieve (const std::string & __s, interval & __v, const interval & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 247 of file datamap.hpp.

10.167.3.78 bool coco::datamap::retrieve (const std::string & __s, std::string & __is, const std::string & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 269 of file datamap.hpp.

10.167.3.79 bool coco::datamap::retrieve (const std::string & __s, num::Number & __is, const num::Number & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 291 of file datamap.hpp.

10.167.3.80 bool coco::datamap::retrieve (const std::string & __s, const std::vector< bool > *& __v, const std::vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple

types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 313 of file datamap.hpp.

10.167.3.81 bool coco::datamap::retrieve (const std::string & __s, const std::vector< int > *& __v, const std::vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 335 of file datamap.hpp.

10.167.3.82 bool coco::datamap::retrieve (const std::string & __s, const std::vector< unsigned int > *& __v, const std::vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 357 of file datamap.hpp.

10.167.3.83 bool coco::datamap::retrieve (const std::string & __s, const std::vector< double > *& __v, const std::vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 379 of file datamap.hpp.

10.167.3.84 bool coco::datamap::retrieve (const std::string & __s, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 401 of file datamap.hpp.

10.167.3.85 bool coco::datamap::retrieve (const std::string & __s, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 423 of file datamap.hpp.

10.167.3.86 bool coco::datamap::retrieve (const std::string & __s, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 445 of file datamap.hpp.

10.167.3.87 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 467 of file datamap.hpp.

10.167.3.88 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 489 of file datamap.hpp.

10.167.3.89 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 511 of file datamap.hpp.

10.167.3.90 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 533 of file datamap.hpp.

10.167.3.91 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< interval > *& __v*, const vmtl::sparse_vector< interval > * *__def*) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 555 of file datamap.hpp.

10.167.3.92 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< std::string > *& __v*, const vmtl::sparse_vector< std::string > * *__def*) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 577 of file datamap.hpp.

10.167.3.93 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::sparse_vector< num::Number > *& __v*, const vmtl::sparse_vector< num::Number > * *__def*) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 599 of file datamap.hpp.

10.167.3.94 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::dense_matrix< double > *& __v*, const vmtl::dense_matrix< double > * *__def*) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 621 of file datamap.hpp.

10.167.3.95 bool coco::datamap::retrieve (const std::string & *__s*, const vmtl::dense_matrix< int > *& __v*, const vmtl::dense_matrix< int > * *__def*) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 643 of file datamap.hpp.

10.167.3.96 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< interval > *& __v, const vmtl::dense_matrix< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 665 of file datamap.hpp.

10.167.3.97 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< std::string > *& __v, const vmtl::dense_matrix< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 687 of file datamap.hpp.

10.167.3.98 bool coco::datamap::retrieve (const std::string & __s, const vmtl::dense_matrix< num::Number > *& __v, const vmtl::dense_matrix< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 709 of file datamap.hpp.

10.167.3.99 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< double > *& __v, const vmtl::sparse_matrix< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 731 of file datamap.hpp.

10.167.3.100 bool coco::datamap::retrieve (const std::string & __s, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 753 of file datamap.hpp.

Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1099 of file datamap.hpp.

10.167.3.131 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1110 of file datamap.hpp.

10.167.3.132 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1121 of file datamap.hpp.

10.167.3.133 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1132 of file datamap.hpp.

10.167.3.134 bool coco::datamap::retrieve (const char * __s, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s to the variable __v. It is returned whether the variable is set. If the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1143 of file datamap.hpp.

10.167.3.135 bool coco::datamap::retrieve_i (const std::string & __s, int i, bool & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1150 of file datamap.hpp.

10.167.3.136 bool coco::datamap::retrieve_i (const std::string & __s, int i, int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1170 of file datamap.hpp.

10.167.3.137 bool coco::datamap::retrieve_i (const std::string & __s, int i, unsigned int & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1190 of file datamap.hpp.

10.167.3.138 bool coco::datamap::retrieve_i (const std::string & __s, int i, double & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1210 of file datamap.hpp.

10.167.3.139 bool coco::datamap::retrieve_i (const std::string & __s, int i, interval & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1230 of file datamap.hpp.

10.167.3.140 bool coco::datamap::retrieve_i (const std::string & __s, int i, std::string & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1250 of file datamap.hpp.

10.167.3.141 bool coco::datamap::retrieve_i (const std::string & __s, int i, num::Number & __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1270 of file datamap.hpp.

10.167.3.142 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1290 of file datamap.hpp.

10.167.3.143 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1310 of file datamap.hpp.

10.167.3.144 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1330 of file datamap.hpp.

10.167.3.145 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1350 of file datamap.hpp.

10.167.3.146 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1370 of file datamap.hpp.

10.167.3.147 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1390 of file datamap.hpp.

10.167.3.148 bool coco::datamap::retrieve_i (const std::string & __s, int i, const std::vector< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1410 of file datamap.hpp.

10.167.3.149 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< bool > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1430 of file datamap.hpp.

10.167.3.150 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1450 of file datamap.hpp.

10.167.3.151 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< unsigned int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1470 of file datamap.hpp.

10.167.3.152 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1490 of file datamap.hpp.

10.167.3.153 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1510 of file datamap.hpp.

10.167.3.154 bool coco::datamap::retrieve_i (const std::string & __s, int i, const vmtl::sparse_vector< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. 10.167.3.189 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2002 of file datamap.hpp.

10.167.3.190 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2013 of file datamap.hpp.

10.167.3.191 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::dense_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2024 of file datamap.hpp.

10.167.3.192 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< double > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2035 of file datamap.hpp.

10.167.3.193 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< int > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2046 of file datamap.hpp.

10.167.3.194 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< interval > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2057 of file datamap.hpp.

10.167.3.195 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< std::string > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2068 of file datamap.hpp.

10.167.3.196 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< num::Number > *& __v) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to the variable __v. It is returned whether the variable is set. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2079 of file datamap.hpp.

10.167.3.197 bool coco::datamap::retrieve_i (const std::string & __s, int i, bool & __v, bool __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1161 of file datamap.hpp.

10.167.3.198 bool coco::datamap::retrieve_i (const std::string & __s, int i, int & __v, int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1181 of file datamap.hpp.

10.167.3.199 bool coco::datamap::retrieve_i (const std::string & __s, int i, unsigned int & __v, unsigned int __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1201 of file datamap.hpp.

10.167.3.200 bool coco::datamap::retrieve_i (const std::string & __s, int i, double & __v, double __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1221 of file datamap.hpp.

10.167.3.201 bool coco::datamap::retrieve_i (const std::string & __s, int i, interval & __v, const interval & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1241 of file datamap.hpp.

10.167.3.202 bool coco::datamap::retrieve_i (const std::string & __s, int i, std::string & __is, const std::string & __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1875 of file datamap.hpp.

10.167.3.239 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< interval > *& __v, const std::vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1885 of file datamap.hpp.

10.167.3.240 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< std::string > *& __v, const std::vector< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1895 of file datamap.hpp.

10.167.3.241 bool coco::datamap::retrieve_i (const char * __s, int i, const std::vector< num::Number > *& __v, const std::vector< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1905 of file datamap.hpp.

10.167.3.242 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< bool > *& __v, const vmtl::sparse_vector< bool > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1915 of file datamap.hpp.

10.167.3.243 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< int > *& __v, const vmtl::sparse_vector< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1925 of file datamap.hpp.

10.167.3.244 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< unsigned int > *& __v, const vmtl::sparse_vector< unsigned int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1935 of file datamap.hpp.

10.167.3.245 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< double > *& __v, const vmtl::sparse_vector< double > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 1945 of file datamap.hpp.

10.167.3.246 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_vector< interval > *& __v, const vmtl::sparse_vector< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Definition at line 2040 of file datamap.hpp.

10.167.3.255 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< int > *& __v, const vmtl::sparse_matrix< int > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2051 of file datamap.hpp.

10.167.3.256 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< interval > *& __v, const vmtl::sparse_matrix< interval > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2062 of file datamap.hpp.

10.167.3.257 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< std::string > *& __v, const vmtl::sparse_matrix< std::string > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2073 of file datamap.hpp.

10.167.3.258 bool coco::datamap::retrieve_i (const char * __s, int i, const vmtl::sparse_matrix< num::Number > *& __v, const vmtl::sparse_matrix< num::Number > * __def) const [inline, inherited]

The retrieve methods assign the value of the variable __s with index i to * the variable __v. It is returned whether the variable is set. If * the variable is not set, the value of __def is assigned to __v. Note that the simple types are assigned but for the complex types only pointers are set to the contents of the datamap, in order to reduce unnecessary big copy operations.

Definition at line 2084 of file datamap.hpp.

10.167.3.259 const basic_alltype & coco::datamap::sfind (const std::string & __s) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 81 of file datamap.hpp.

10.167.3.260 const basic_alltype & coco::datamap::sfind (const char * __s) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable __s. If the variable is not set, an empty basic_alltype is returned.

Definition at line 90 of file datamap.hpp.

10.167.3.261 const basic_alltype & coco::datamap::sfind (const std::string & __s, int *i*) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 95 of file datamap.hpp.

10.167.3.262 const basic_alltype & coco::datamap::sfind (const char * __s, int *i*) const [inline, inherited]

This method returns the value (as basic_alltype) of the variable __s with index i. If the variable is not set, an empty basic_alltype is returned.

Definition at line 104 of file datamap.hpp.

10.167.3.263 bool coco::datamap::sinsert (const std::string & __s, const basic_alltype & __h, bool *replace*) [inherited]

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.cc.

10.167.3.264 bool coco::datamap::sinsert (const char * __s, const basic_alltype & __h, bool *replace*) [inline, inherited]

This method inserts the variable __s with value __h into the datamap. If replace is true, the value of an already defined variable __s would be replaced, if it is false the new value would not be set. The method returns whether the variable __s was indeed set to __h.

Definition at line 36 of file datamap.hpp.

10.167.3.265 bool coco::datamap::sinsert (const std::string & __s, int *i*, const basic_alltype & __h, bool *replace*) [inline, inherited]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 42 of file datamap.hpp.

10.167.3.266 bool coco::datamap::sinsert (const char * __s, int *i*, const basic_alltype & __h, bool *replace*) [inline, inherited]

This method inserts the variable __s with index i with value __h into the datamap. If replace is true, the value of an already defined variable __s with index i would be replaced, if it is false the new value

would not be set. The method returns whether the variable __s with index i was indeed set to __h.

Definition at line 50 of file datamap.hpp.

10.167.3.267 bool coco::datamap::which (const std::string & __s, std::vector< int > & __idx) const [inline, inherited]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 129 of file datamap.hpp.

10.167.3.268 bool coco::datamap::which (const char * __s, std::vector< int > & __idx) const [inline, inherited]

The which methods sets __idx to the list of indices defined for the variable with name __s. The methods return whether the variable __s is defined.

Definition at line 143 of file datamap.hpp.

- search_focus ** __sfocus
- gptr< vdbl::database > ** __dbase
- gptr< search_graph > ** __sgraph

10.168.1 Detailed Description

This is the base class of all COCONUT initializer modules. An initializer is a management module, which specializes in initializing data structures like the search graph or the search database.

10.168.2 Constructor & Destructor Documentation

10.168.2.1 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, search_focus *& *sfoc*, gptr< search_graph > *& *sgraph*, gptr< vdbl::database > *& *dbase*) [inline]

This is the most general constructor for an initializer containing parameters for setting all internal variables. The parameter `__n` sets __name, `wnode` sets __wnode, `sfoc` sets __sfocus, `sgraph` sets __sgraph, and `dbase` sets __dbase.

Definition at line 94 of file initializer.h.

10.168.2.2 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, search_focus *& *sfoc*, gptr< search_graph > *& *sgraph*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus and sgraph sets __sgraph.

Definition at line 107 of file initializer.h.

10.168.2.3 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, search_focus *& *sfoc*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus and dbase sets __dbase.

Definition at line 119 of file initializer.h.

10.168.2.4 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, gptr< search_graph > *& *sgraph*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sgraph sets __sgraph and dbase sets __dbase.

Definition at line 131 of file initializer.h.

10.168.2.5 coco::initializer::initializer (const std::string & *__n*, search_focus *& *sfoc*, gptr< search_graph > *& *sgraph*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sgraph sets __sgraph and dbase sets __dbase.

Definition at line 143 of file initializer.h.

10.168.2.6 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, search_focus *& *sfoc*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus.

Definition at line 154 of file initializer.h.

10.168.2.7 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, dbase sets __dbase.

Definition at line 164 of file initializer.h.

10.168.2.8 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*, gptr< search_graph > *& *sgraph*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sgraph sets __sgraph.

Definition at line 174 of file initializer.h.

10.168.2.9 coco::initializer::initializer (const std::string & *__n*, search_focus *& *sfoc*, gptr< search_graph > *& *sgraph*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sgraph sets __sgraph.

Definition at line 184 of file initializer.h.

10.168.2.10 coco::initializer::initializer (const std::string & *__n*, search_focus *& *sfoc*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, dbase sets __dbase.

Definition at line 194 of file initializer.h.

10.168.2.11 coco::initializer::initializer (const std::string & *__n*, gptr< search_graph > *& *sgraph*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name, sgraph sets __sgraph, dbase sets __dbase.

Definition at line 204 of file initializer.h.

10.168.2.12 coco::initializer::initializer (const std::string & *__n*, gptr< work_node > *& *wnode*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name and wnode sets __wnode.

Definition at line 214 of file initializer.h.

10.168.2.13 coco::initializer::initializer (const std::string & *__n*, search_focus *& *sfoc*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name and sfoc sets __sfocus.

Definition at line 222 of file initializer.h.

10.168.2.14 coco::initializer::initializer (const std::string & *__n*, gptr< search_graph > *& *sgraph*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name and sgraph sets __sgraph.

Definition at line 230 of file initializer.h.

10.168.2.15 coco::initializer::initializer (const std::string & *__n*, gptr< vdbl::database > *& *dbase*) [inline]

This is a constructor for an initializer containing parameters for setting some internal variables. The parameter __n sets __name and dbase sets __dbase.

Definition at line 238 of file initializer.h.

10.168.2.16 virtual coco::initializer::~initializer ( ) [inline, virtual]

Standard Destructor

Definition at line 244 of file initializer.h.

10.168.3 Member Function Documentation

10.168.3.1 const std::string& coco::initializer::get_name ( ) const [inline]

The get_name method returns the identifier string of the initializer.

Definition at line 247 of file initializer.h.

10.168.3.2 virtual ie_return_type coco::initializer::initialize (const control_data & _c) [inline, virtual]

This method is the main method of an initializer. It is supposed to initialize various internal data structures. Status information is returned in a ie_return_type structure. This method is overloaded by the various subclasses. Service information and parameters are provided via the control_data structure __c.

Definition at line 254 of file initializer.h.

10.168.4 Member Data Documentation

10.168.4.1 gptr<vdbl::database>** coco::initializer::__dbase [protected]

This variable contains a pointer to a global pointer to the search database.

Definition at line 85 of file initializer.h.

10.168.4.2 std::string coco::initializer::__name [protected]

This is the identifier string for an initializer.

Definition at line 78 of file initializer.h.

10.168.4.3 search_focus** coco::initializer::__sfocus [protected]

This variable contains a pointer to a pointer to the search focus.

Definition at line 82 of file initializer.h.

10.168.4.4 gptr<search_graph>** coco::initializer::__sgraph [protected]

This variable contains a pointer to a global pointer to the search graph.

Definition at line 87 of file initializer.h.

10.168.4.5 gptr<work_node>** coco::initializer::__wnode [protected]

This variable contains a pointer to a global pointer to the work node.

Definition at line 80 of file initializer.h.

The documentation for this class was generated from the following file:

- initializer.h

10.169 coco::initializer_exception Class Reference

10.169.1 Detailed Description

This is the exceptions class thrown by initializer subclasses. Every properly coded COCONUT initializer module should only throw exceptions of this type.

10.169.2 Constructor & Destructor Documentation

10.169.2.1 coco::initializer_exception::initializer_exception (const std::string & *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 58 of file initializer.h.

10.169.2.2 coco::initializer_exception::initializer_exception (const char * *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 61 of file initializer.h.

10.169.2.3 virtual coco::initializer_exception::~initializer_exception ( ) throw () [inline, virtual]

Standard Destructor

Definition at line 65 of file initializer.h.

10.169.3 Member Function Documentation

10.169.3.1 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file expression.h.

10.169.3.2 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.169.3.3 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.169.3.4 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.169.3.5 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.169.3.6 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.169.3.7 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.169.3.8 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file expression.h.

10.169.3.9 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.169.3.10 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.169.3.11 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.169.3.12 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.169.3.13 const char * coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

Definition at line 57 of file api_exception.cc.

10.169.3.14 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.169.3.15 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.169.3.16 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.169.3.17 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.169.3.18 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file expression.h.

10.169.3.19 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.169.3.20 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

The documentation for this class was generated from the following file:

- initializer.h

10.170.2.15 coco::coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file search_graph.cc.

10.170.2.16 coco::coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file search_graph.cc.

10.170.3 Member Function Documentation

10.170.3.1 __Base coco::coco::coco::interval::base ( ) const [inline]

Definition at line 153 of file search_graph.cc.

10.170.3.2 __Base coco::coco::coco::interval::base ( ) const [inline]

Definition at line 153 of file search_graph.cc.

10.170.3.3 bool coco::coco::coco::interval::contains (const interval & *x*) const [inline]

Definition at line 235 of file search_graph.cc.

10.170.3.4 bool coco::coco::coco::interval::contains (const interval & *x*) const [inline]

Definition at line 235 of file search_graph.cc.

10.170.3.5 double coco::coco::coco::interval::diam ( ) const

10.170.3.6 double coco::coco::coco::interval::diam ( ) const

10.170.3.7 bool coco::coco::coco::interval::disjoint (const interval & *x*) const [inline]

Definition at line 174 of file search_graph.cc.

10.170.3.8 bool coco::coco::coco::interval::disjoint (const interval & *x*) const [inline]

Definition at line 174 of file search_graph.cc.

10.170.3.9 double coco::coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.170.3.10 double coco::coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.170.3.11 static interval coco::coco::coco::interval::EMPTY ( ) [inline, static]

Definition at line 154 of file search_graph.cc.

10.170.3.12 static interval coco::coco::coco::interval::EMPTY ( ) [inline, static]

Definition at line 154 of file search_graph.cc.

10.170.3.13 bool coco::coco::coco::interval::empty ( ) const [inline]

Definition at line 157 of file search_graph.cc.

10.170.3.14 bool coco::coco::coco::interval::empty ( ) const [inline]

Definition at line 157 of file search_graph.cc.

10.170.3.15 void coco::coco::coco::interval::get_bounds (double & *a*, double & *b*) const [inline]

Definition at line 244 of file search_graph.cc.

10.170.3.16 void coco::coco::coco::interval::get_bounds (double & *a*, double & *b*) const [inline]

Definition at line 244 of file search_graph.cc.

10.170.3.17 interval coco::coco::coco::interval::hull (const interval & *x*) const [inline]

`y.hull(x)` returns the hull of `y` and `x`.

Definition at line 214 of file search_graph.cc.

10.170.3.18 interval coco::coco::coco::interval::hull (const interval & *x*) const [inline]

`y.hull(x)` returns the hull of `y` and `x`.

Definition at line 214 of file search_graph.cc.

10.170.3.19 interval coco::coco::coco::interval::hulldiff (const interval & *x*) const [inline]

`y.hulldiff(x)` returns the hull of the set difference of `y` and `x`.

Definition at line 221 of file search_graph.cc.

10.170.3.20 interval coco::coco::coco::interval::hulldiff (const interval & *x*) const [inline]

`y.hulldiff(x)` returns the hull of the set difference of `y` and `x`.

Definition at line 221 of file search_graph.cc.

10.170.3.21 interval& coco::coco::coco::interval::hulldiffwith (const interval & *x*) [inline]

Definition at line 193 of file search_graph.cc.

10.170.3.22 interval& coco::coco::coco::interval::hulldiffwith (const interval & *x*) [inline]

Definition at line 193 of file search_graph.cc.

10.170.3.23 interval& coco::coco::coco::interval::hullwith (const interval & *x*) [inline]

Definition at line 187 of file search_graph.cc.

10.170.3.24 interval& coco::coco::coco::interval::hullwith (const interval & *x*) [inline]

Definition at line 187 of file search_graph.cc.

10.170.3.25 interval& coco::coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and `x`.

10.170.3.26 interval& coco::coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and `x`.

10.170.3.27 interval& coco::coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and `x`.

10.170.3.28 interval& coco::coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and `x`.

10.170.3.29 double coco::coco::coco::interval::inf ( ) const [inline]

Definition at line 151 of file search_graph.cc.

10.170.3.30 double coco::coco::coco::interval::inf ( ) const [inline]

Definition at line 151 of file search_graph.cc.

10.170.3.31 interval coco::coco::coco::interval::intersect (const interval & *x*) const [inline]

`y.intersect(x)` returns the intersection of `y` and `x`.

Definition at line 208 of file search_graph.cc.

10.170.3.32 interval coco::coco::coco::interval::intersect (const interval & *x*) const [inline]

`y.intersect(x)` returns the intersection of `y` and `x`.

Definition at line 208 of file search_graph.cc.

10.170.3.33 interval& coco::coco::coco::interval::intersect_div (const interval & *__i*, const interval & *__j*)

10.170.3.48 interval& coco::coco::coco::interval::intersect_power (const interval & __i, int __n)

10.170.3.49 interval& coco::coco::coco::interval::intersectwith (const interval & *x*) [inline]

Definition at line 180 of file search_graph.cc.

10.170.3.50 interval& coco::coco::coco::interval::intersectwith (const interval & *x*) [inline]

Definition at line 180 of file search_graph.cc.

10.170.3.51 interval& coco::coco::coco::interval::ipow (int *n*)

The method changes this interval to the `n-th` power.

10.170.3.52 interval& coco::coco::coco::interval::ipow (int *n*)

The method changes this interval to the `n-th` power.

10.170.3.53 bool coco::coco::coco::interval::is_bounded ( ) const [inline]

Definition at line 163 of file search_graph.cc.

10.170.3.54 bool coco::coco::coco::interval::is_bounded ( ) const [inline]

Definition at line 163 of file search_graph.cc.

10.170.3.55 bool coco::coco::coco::interval::is_empty ( ) const [inline]

Definition at line 158 of file search_graph.cc.

10.170.3.56 bool coco::coco::coco::interval::is_empty ( ) const [inline]

Definition at line 158 of file search_graph.cc.

10.170.3.57 bool coco::coco::coco::interval::is_entire ( ) const [inline]

Definition at line 162 of file search_graph.cc.

10.170.3.58 bool coco::coco::coco::interval::is_entire ( ) const [inline]

Definition at line 162 of file search_graph.cc.

10.170.3.59 bool coco::coco::coco::interval::is_thin ( ) const [inline]

Definition at line 159 of file search_graph.cc.

10.170.3.60 bool coco::coco::coco::interval::is_thin ( ) const [inline]

Definition at line 159 of file search_graph.cc.

10.170.3.61 bool coco::coco::coco::interval::is_unbounded_above ( ) const [inline]

Definition at line 161 of file search_graph.cc.

10.170.3.62 bool coco::coco::coco::interval::is_unbounded_above ( ) const [inline]

Definition at line 161 of file search_graph.cc.

10.170.3.63 bool coco::coco::coco::interval::is_unbounded_below ( ) const [inline]

Definition at line 160 of file search_graph.cc.

10.170.3.64 bool coco::coco::coco::interval::is_unbounded_below ( ) const [inline]

Definition at line 160 of file search_graph.cc.

10.170.3.65 double coco::coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.170.3.66 double coco::coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.170.3.67 double coco::coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.170.3.68 double coco::coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.170.3.69 double coco::coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.170.3.70 double coco::coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.170.3.71 interval& coco::coco::coco::interval::operator*= (const interval & *a*)

10.170.3.72 interval& coco::coco::coco::interval::operator*= (const interval & *a*)

10.170.3.73 interval& coco::coco::coco::interval::operator*= (double *a*)

10.170.3.97 interval& coco::coco::coco::interval::operator= (long *d*) [inline]

Definition at line 253 of file search_graph.cc.

10.170.3.98 interval& coco::coco::coco::interval::operator= (long *d*) [inline]

Definition at line 253 of file search_graph.cc.

10.170.3.99 interval& coco::coco::coco::interval::operator= (unsigned long *d*) [inline]

Definition at line 254 of file search_graph.cc.

10.170.3.100 interval& coco::coco::coco::interval::operator= (unsigned long *d*) [inline]

Definition at line 254 of file search_graph.cc.

10.170.3.101 static int const& coco::coco::coco::interval::precision ( ) [static]

This method returns the output precision that is used by the output operator <<.

10.170.3.102 static int const& coco::coco::coco::interval::precision ( ) [static]

This method returns the output precision that is used by the output operator <<.

10.170.3.103 static int coco::coco::coco::interval::precision (int const & *p*) [static]

This method sets the output precision to p. The default value is 3.

10.170.3.104 static int coco::coco::coco::interval::precision (int const & *p*) [static]

This method sets the output precision to p. The default value is 3.

10.170.3.105 double coco::coco::coco::interval::project (double __*d*) const

10.170.3.106 double coco::coco::interval::project (double __*d*) const [inline]

Definition at line 831 of file expression.h.

10.170.3.107 bool coco::coco::coco::interval::proper_subset (const interval & *x*) const [inline]

Definition at line 170 of file search_graph.cc.

10.170.3.108 bool coco::coco::coco::interval::proper_subset (const interval & *x*) const [inline]

Definition at line 170 of file search_graph.cc.

10.170.3.109 bool coco::coco::coco::interval::proper_superset (const interval & *x*) const [inline]

Definition at line 172 of file search_graph.cc.

10.170.3.110 bool coco::coco::coco::interval::proper_superset (const interval & *x*) const [inline]

Definition at line 172 of file search_graph.cc.

10.170.3.111 double coco::coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.170.3.112 double coco::coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.170.3.113 double coco::coco::coco::interval::rel_width ( ) const

10.170.3.114 double coco::coco::coco::interval::rel_width ( ) const

10.170.3.115 double coco::coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.170.3.116 double coco::coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.170.3.117 interval& coco::coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.170.3.118 interval& coco::coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.170.3.119 double coco::coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.170.3.120 double coco::coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.170.3.121 void coco::coco::coco::interval::set (double *lo,* double *up*) [inline]

Definition at line 145 of file search_graph.cc.

10.170.3.122 void coco::coco::coco::interval::set (double *lo,* double *up*) [inline]

Definition at line 145 of file search_graph.cc.

Definition at line 152 of file search_graph.cc.

10.170.3.134 double coco::coco::coco::interval::sup ( ) const [inline]

Definition at line 152 of file search_graph.cc.

10.170.3.135 bool coco::coco::coco::interval::superset (const interval & *x*) const [inline]

Definition at line 168 of file search_graph.cc.

10.170.3.136 bool coco::coco::coco::interval::superset (const interval & *x*) const [inline]

Definition at line 168 of file search_graph.cc.

10.170.3.137 double coco::coco::coco::interval::width ( ) const

10.170.3.138 double coco::coco::coco::interval::width ( ) const

10.170.4 Friends And Related Function Documentation

10.170.4.1 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.170.4.2 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.170.4.3 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.170.4.4 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.170.4.5 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.170.4.6 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.170.4.7 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.170.4.8 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.170.4.9 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.170.4.10 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.170.4.11 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.170.4.12 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.170.4.13 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.170.4.14 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.170.4.15 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.170.4.16 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.170.4.17 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.170.4.18 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.170.4.19 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.170.4.20 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.170.4.21 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.170.4.22 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.170.4.23 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.170.4.24 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.170.4.25 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.170.4.26 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.170.4.27 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.170.4.28 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.170.4.29 interval division_part1 (const interval & *x,* const interval & *y,* bool & *b*) [friend]

10.170.4.30 interval division_part1 (const interval & *x,* const interval & *y,* bool & *b*) [friend]

10.170.4.31 interval division_part2 (const interval & *x,* const interval & *y,* bool *b*) [friend]

10.170.4.32 interval division_part2 (const interval & *x,* const interval & *y,* bool *b*) [friend]

10.170.4.33 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.170.4.34 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.170.4.35 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.170.4.36 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.170.4.37 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.170.4.38 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.170.4.39 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.170.4.40 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.170.4.41 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.170.4.42 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.170.4.43 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.170.4.44 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.170.4.45 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.170.4.46 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.170.4.47 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.170.4.48 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.170.4.49 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.170.4.50 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.170.4.51 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.170.4.52 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.170.4.53 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

10.170.4.54 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

10.170.4.55 interval operator∗ (const interval & *a*, double *b*) [friend]

10.170.4.72 interval operator/ (const interval & *a*, const interval & *b*) [friend]

10.170.4.73 interval operator/ (const interval & *a*, double *b*) [friend]

10.170.4.74 interval operator/ (const interval & *a*, double *b*) [friend]

10.170.4.75 interval operator/ (double *b*, const interval & *a*) [friend]

10.170.4.76 interval operator/ (double *b*, const interval & *a*) [friend]

10.170.4.77 std::ostream& operator<< (std::ostream & *s*, const interval & *a*) [friend]

10.170.4.78 std::ostream& operator<< (std::ostream & *s*, const interval & *a*) [friend]

10.170.4.79 interval pow (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.170.4.80 interval pow (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.170.4.81 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.170.4.82 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.170.4.83 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.170.4.84 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.170.4.85 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.170.4.86 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.170.4.87 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.170.4.88 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.170.4.89 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.170.4.90 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.170.4.91 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.170.4.92 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.170.4.93 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.170.4.94 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

The documentation for this class was generated from the following file:

- interval_boost.h

10.171 coco::interval Class Reference

Interval wrapper class.

`#include <interval_boost.h>`

10.171.1 Detailed Description

This is a wrapper class to make the COCONUT environment independent from a <it>specific</it> interval library. Currently, the FILIB++ library works underneath.

This is a wrapper class to make the COCONUT environment independent from a <it>specific</it> interval library.

Definition at line 72 of file interval_filib.h.

10.171.2 Constructor & Destructor Documentation

10.171.2.1 coco::interval::interval (double *lo*, double *up*) [inline]

Definition at line 134 of file interval_boost.h.

10.171.2.2 coco::interval::interval (double *d* = 0) [inline]

Definition at line 135 of file interval_boost.h.

10.171.2.3 coco::interval::interval (int *d*) [inline]

Definition at line 136 of file interval_boost.h.

10.171.2.4 coco::interval::interval (unsigned *d*) [inline]

Definition at line 137 of file interval_boost.h.

10.171.2.5 coco::interval::interval (long *d*) [inline]

Definition at line 138 of file interval_boost.h.

10.171.2.6 coco::interval::interval (unsigned long *d*) [inline]

Definition at line 139 of file interval_boost.h.

10.171.2.7 coco::interval::interval (const interval & *x*) [inline]

Definition at line 140 of file interval_boost.h.

10.171.2.8 coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 141 of file interval_boost.h.

10.171.2.9 coco::interval::interval (double *lo,* double *up*) [inline]

Constructor, setting the interval to [lo,up].

Definition at line 86 of file interval_filib.h.

10.171.2.10 coco::interval::interval (double *d* = 0) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 88 of file interval_filib.h.

10.171.2.11 coco::interval::interval (int *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 90 of file interval_filib.h.

10.171.2.12 coco::interval::interval (unsigned *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 92 of file interval_filib.h.

10.171.2.13 coco::interval::interval (long *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 94 of file interval_filib.h.

10.171.2.14 coco::interval::interval (unsigned long *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 96 of file interval_filib.h.

10.171.2.15 coco::interval::interval (const __Base & *x*) [inline, explicit]

Constructor, setting the interval from a base class interval.

Definition at line 98 of file interval_filib.h.

10.171.2.16 coco::interval::interval (const interval & *x*) [inline]

Standard Copy Constructor

Definition at line 100 of file interval_filib.h.

10.171.2.17 coco::interval::interval (const interval_st & *x*) [inline]

Constructor, setting the interval from a interval_st interval storage.

Definition at line 102 of file interval_filib.h.

10.171.2.18 coco::interval::interval (double *lo*, double *up*) [inline]

Constructor, setting the interval to [lo,up].

Definition at line 68 of file interval_profil.h.

10.171.2.19 coco::interval::interval (double *d* = 0) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 70 of file interval_profil.h.

10.171.2.20 coco::interval::interval (int *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 72 of file interval_profil.h.

10.171.2.21 coco::interval::interval (unsigned *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 74 of file interval_profil.h.

10.171.2.22 coco::interval::interval (long *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 76 of file interval_profil.h.

10.171.2.23 coco::interval::interval (unsigned long *d*) [inline]

Constructor, setting the interval to the thin interval [d,d].

Definition at line 78 of file interval_profil.h.

10.171.2.24 coco::interval::interval (const __Base & *x*) [inline, explicit]

Constructor, setting the interval from a base class interval.

Definition at line 80 of file interval_profil.h.

10.171.2.25 coco::interval::interval (const interval & *x*) [inline]

Standard Copy Constructor

Definition at line 82 of file interval_profil.h.

10.171.2.26 coco::interval::interval (const interval_st & *x*) [inline]

Constructor, setting the interval from a interval_st interval storage.

Definition at line 84 of file interval_profil.h.

10.171.3 Member Function Documentation

10.171.3.1 __Base coco::interval::base ( ) const [inline]

This method returns a base class representing the same interval.

Definition at line 93 of file interval_profil.h.

10.171.3.2 __Base coco::interval::base ( ) const [inline]

This method returns a base class representing the same interval.

Definition at line 116 of file interval_filib.h.

10.171.3.3 __Base coco::interval::base ( ) const [inline]

Definition at line 152 of file interval_boost.h.

10.171.3.4 bool coco::interval::ceq (const interval & *x*) const [inline]

Perform ceq comparison

Definition at line 176 of file interval_filib.h.

10.171.3.5 bool coco::interval::cge (const interval & *x*) const [inline]

Perform cge comparison

Definition at line 182 of file interval_filib.h.

10.171.3.6 bool coco::interval::cgt (const interval & *x*) const [inline]

Perform cgt comparison

Definition at line 185 of file interval_filib.h.

10.171.3.7 bool coco::interval::cle (const interval & *x*) const [inline]

Perform cle comparison

Definition at line 188 of file interval_filib.h.

10.171.3.8 bool coco::interval::clt (const interval & *x*) const [inline]

Perform clt comparison

Definition at line 191 of file interval_filib.h.

10.171.3.9 bool coco::interval::cne (const interval & *x*) const [inline]

Perform cne comparison

Definition at line 179 of file interval_filib.h.

10.171.3.10 bool coco::interval::contains (const interval & *x*) const [inline]

Check whether this interval contains `x`.

Definition at line 202 of file interval_profil.h.

10.171.3.11 bool coco::interval::contains (const interval & *x*) const [inline]

Definition at line 234 of file interval_boost.h.

10.171.3.12 bool coco::interval::contains (const interval & *x*) const [inline]

Check whether this interval contains `x`.

Definition at line 274 of file interval_filib.h.

10.171.3.13 double coco::interval::diam ( ) const

10.171.3.14 double coco::interval::diam ( ) const

Returns an upper bound for the diameter (width) of this interval, i.e.

a.diam() == a.sup()-a.inf()

Special cases in the extended system:

- a.diam() == NaN for a == [EMPTY]
- a.diam() == +INF for any infinite interval

10.171.3.15 double coco::interval::diam ( ) const

Returns an upper bound for the diameter (width) of this interval, i.e.

a.diam() == a.sup()-a.inf()

Special cases in the extended system:

- a.diam() == NaN for a == [EMPTY]
- a.diam() == +INF for any infinite interval

10.171.3.16 bool coco::interval::disjoint (const interval & *x*) const [inline]

This method checks whether this interval and x are disjoint.

Definition at line 133 of file interval_profil.h.

10.171.3.17 bool coco::interval::disjoint (const interval & *x*) const [inline]

This method checks whether this interval and x are disjoint.

Definition at line 151 of file interval_filib.h.

10.171.3.18 bool coco::interval::disjoint (const interval & *x*) const [inline]

Definition at line 173 of file interval_boost.h.

10.171.3.19 double coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.171.3.20 double coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.171.3.21 double coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.171.3.22 static interval coco::interval::EMPTY ( ) [inline, static]

This returns a new empty interval.

Definition at line 97 of file interval_profil.h.

10.171.3.23 bool coco::interval::empty ( ) const [inline]

This method checks whether the interval is empty.

Definition at line 100 of file interval_profil.h.

10.171.3.24 static interval coco::interval::EMPTY ( ) [inline, static]

This returns a new empty interval.

Definition at line 118 of file interval_filib.h.

10.171.3.25 bool coco::interval::empty ( ) const [inline]

This method checks whether the interval is empty.

Definition at line 121 of file interval_filib.h.

10.171.3.26 static interval coco::interval::EMPTY ( ) [inline, static]

Definition at line 153 of file interval_boost.h.

10.171.3.27 bool coco::interval::empty ( ) const [inline]

Definition at line 156 of file interval_boost.h.

10.171.3.28 void coco::interval::get_bounds (double & *a*, double & *b*) const [inline]

Set the pair `a` and `b` to the bounds of the interval.

Definition at line 213 of file interval_profil.h.

10.171.3.29 void coco::interval::get_bounds (double & *a*, double & *b*) const [inline]

Definition at line 243 of file interval_boost.h.

10.171.3.30 void coco::interval::get_bounds (double & *a,* double & *b*) const [inline]

Set the pair `a` and `b` to the bounds of the interval.

Definition at line 285 of file interval_filib.h.

10.171.3.31 interval coco::interval::hull (const interval & *x*) const [inline]

`y.hull(x)` returns the hull of `y` and `x`.

Definition at line 180 of file interval_profil.h.

10.171.3.32 interval coco::interval::hull (const interval & *x*) const [inline]

`y.hull(x)` returns the hull of `y` and `x`.

Definition at line 213 of file interval_boost.h.

10.171.3.33 interval coco::interval::hull (const interval & *x*) const [inline]

`y.hull(x)` returns the hull of `y` and `x`.

Definition at line 251 of file interval_filib.h.

10.171.3.34 interval coco::interval::hulldiff (const interval & *x*) const [inline]

`y.hulldiff(x)` returns the hull of the set difference of `y` and `x`.

Definition at line 187 of file interval_profil.h.

10.171.3.35 interval coco::interval::hulldiff (const interval & *x*) const [inline]

`y.hulldiff(x)` returns the hull of the set difference of `y` and `x`.

Definition at line 220 of file interval_boost.h.

10.171.3.36 interval coco::interval::hulldiff (const interval & *x*) const [inline]

`y.hulldiff(x)` returns the hull of the set difference of `y` and `x`.

Definition at line 258 of file interval_filib.h.

10.171.3.37 interval& coco::interval::hulldiffwith (const interval & *x*) [inline]

`y.hulldiffwith(x)` constructs the hull of the set difference of `y` and `x`.

Definition at line 157 of file interval_profil.h.

10.171.3.38 interval& coco::interval::hulldiffwith (const interval & *x*) [inline]

Definition at line 192 of file interval_boost.h.

10.171.3.39 interval& coco::interval::hulldiffwith (const interval & *x*) [inline]

`y.hulldiffwith(x)` constructs the hull of the set difference of `y` and `x`.

Definition at line 229 of file interval_filib.h.

10.171.3.40 interval& coco::interval::hullwith (const interval & *x*) [inline]

`y.hullwith(x)` builds the hull of `y` with `x`.

Definition at line 150 of file interval_profil.h.

10.171.3.41 interval& coco::interval::hullwith (const interval & *x*) [inline]

Definition at line 186 of file interval_boost.h.

10.171.3.42 interval& coco::interval::hullwith (const interval & *x*) [inline]

`y.hullwith(x)` builds the hull of `y` with `x`.

Definition at line 222 of file interval_filib.h.

10.171.3.43 interval& coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and `x`.

10.171.3.44 interval& coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and `x`.

10.171.3.45 interval& coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and `x`.

10.171.3.46 interval& coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and `x`.

10.171.3.47 interval& coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and `x`.

10.171.3.48 interval& coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and `x`.

10.171.3.49 double coco::interval::inf ( ) const [inline]

This method returns the lower bound of the interval.

Definition at line 113 of file interval_filib.h.

10.171.3.50 double coco::interval::inf ( ) const [inline]

Definition at line 150 of file interval_boost.h.

10.171.3.51 bool coco::interval::interior (const interval & *x*) const [inline]

This method checks whether this interval is contained in the interior of `x`.

Definition at line 154 of file interval_filib.h.

10.171.3.52 interval coco::interval::intersect (const interval & *x*) const [inline]

`y.intersect(x)` returns the intersection of `y` and `x`.

Definition at line 172 of file interval_profil.h.

10.171.3.53 interval coco::interval::intersect (const interval & *x*) const [inline]

`y.intersect(x)` returns the intersection of `y` and `x`.

Definition at line 207 of file interval_boost.h.

10.171.3.54 interval coco::interval::intersect (const interval & *x*) const [inline]

`y.intersect(x)` returns the intersection of `y` and `x`.

Definition at line 245 of file interval_filib.h.

10.171.3.55 interval& coco::interval::intersect_div (const interval & *__i*, const interval & *__j*)

`i.intersect_div(j,k)` computes the interval hull of the set $i \cap (j/k)$.

10.171.3.56 interval& coco::interval::intersect_div (const interval & *__i*, const interval & *__j*)

10.171.3.57 interval& coco::interval::intersect_div (const interval & *__i*, const interval & *__j*)

`i.intersect_div(j,k)` computes the interval hull of the set $i \cap (j/k)$.

10.171.3.58 interval& coco::interval::intersect_invcos_wc (const interval & *__i*, double *__l*, double *__d*)

`i.intersect_infcos_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto \cos(lx+d)$.

10.171.3.59 interval& coco::interval::intersect_invcos_wc (const interval & *__i*, double *__l*, double *__d*)

10.171.3.60 interval& coco::interval::intersect_invcos_wc (const interval & *__i*, double *__l*, double *__d*)

`i.intersect_infcos_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto \cos(lx+d)$.

10.171.3.61 interval& coco::interval::intersect_invcosh_wc (const interval & *__i*, double *__l*, double *__d*)

10.171.3.62 interval& coco::interval::intersect_invcosh_wc (const interval & *__i*, double *__l*, double *__d*)

`i.intersect_infcosh_wc(j,l,n)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto cosh(lx+d)$.

10.171.3.63 interval& coco::interval::intersect_invgauss_wc (const interval & *__i*, double *__l*, double *__m*, double *__s*)

`i.intersect_infgauss_wc(j,l,m,s)` computes the interval hull of the set $i \cap f(j,l,m,s)$, where f is the inverse image of j under the function $x \mapsto e^{-(\frac{lx-m}{s})^2}$.

10.171.3.64 interval& coco::interval::intersect_invgauss_wc (const interval & __i, double __l, double __m, double __s)

10.171.3.65 interval& coco::interval::intersect_invgauss_wc (const interval & __i, double __l, double __m, double __s)

`i.intersect_infgauss_wc(j,l,m,s)` computes the interval hull of the set $i \cap f(j,l,m,s)$, where f is the inverse image of j under the function $x \mapsto e^{-(\frac{lx-m}{s})^2}$.

10.171.3.66 interval& coco::interval::intersect_invpower_wc (const interval & __i, double __l, int __n)

`i.intersect_infpower_wc(j,l,n)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto (lx)^n$.

10.171.3.67 interval& coco::interval::intersect_invpower_wc (const interval & __i, double __l, int __n)

10.171.3.68 interval& coco::interval::intersect_invpower_wc (const interval & __i, double __l, int __n)

`i.intersect_infpower_wc(j,l,n)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto (lx)^n$.

10.171.3.69 interval& coco::interval::intersect_invsin_wc (const interval & __i, double __l, double __d)

`i.intersect_infsin_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto \sin(lx+d)$.

10.171.3.70 interval& coco::interval::intersect_invsin_wc (const interval & __i, double __l, double __d)

10.171.3.71 interval& coco::interval::intersect_invsin_wc (const interval & __i, double __l, double __d)

`i.intersect_infsin_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,n)$, where f is the inverse image of j under the function $x \mapsto \sin(lx+d)$.

10.171.3.72 interval& coco::interval::intersect_invsqr_wc (const interval & __i, double __l, double __d)

`i.intersect_infsqr_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,d)$, where f is the inverse image of j under the function $x \mapsto (lx+d)^2$.

10.171.3.73 interval& coco::interval::intersect_invsqr_wc (const interval & __i, double __l, double __d)

10.171.3.74 interval& coco::interval::intersect_invsqr_wc (const interval & __i, double __l, double __d)

`i.intersect_infsqr_wc(j,l,d)` computes the interval hull of the set $i \cap f(j,l,d)$, where f is the inverse image of j under the function $x \mapsto (lx+d)^2$.

10.171.3.75 interval& coco::interval::intersect_power (const interval & __i, int __n)

`i.intersect_power(j,n)` computes the interval hull of the set $i \cap j^n$.

10.171.3.76 interval& coco::interval::intersect_power (const interval & __i, int __n)

10.171.3.77 interval& coco::interval::intersect_power (const interval & __i, int __n)

`i.intersect_power(j,n)` computes the interval hull of the set $i \cap j^n$.

10.171.3.78 interval& coco::interval::intersectwith (const interval & x) [inline]

`y.intersectwith(x)` intersects `y` with `x`.

Definition at line 142 of file interval_profil.h.

10.171.3.79 interval& coco::interval::intersectwith (const interval & x) [inline]

Definition at line 179 of file interval_boost.h.

10.171.3.80 interval& coco::interval::intersectwith (const interval & x) [inline]

`y.intersectwith(x)` intersects `y` with `x`.

Definition at line 216 of file interval_filib.h.

10.171.3.81 interval& coco::interval::ipow (int n)

The method changes this interval to the `n-th` power.

10.171.3.82 interval& coco::interval::ipow (int n)

The method changes this interval to the `n-th` power.

10.171.3.83 interval& coco::interval::ipow (int n)

The method changes this interval to the `n-th` power.

10.171.3.84 bool coco::interval::is_bounded ( ) const [inline]

This method checks whether the interval is bounded.

Definition at line 118 of file interval_profil.h.

10.171.3.85 bool coco::interval::is_bounded ( ) const [inline]

This method checks whether the interval is bounded.

Definition at line 136 of file interval_filib.h.

10.171.3.86 bool coco::interval::is_bounded ( ) const [inline]

Definition at line 162 of file interval_boost.h.

10.171.3.87 bool coco::interval::is_empty ( ) const [inline]

This method checks whether the interval is empty.

Definition at line 102 of file interval_profil.h.

10.171.3.88 bool coco::interval::is_empty ( ) const [inline]

This method checks whether the interval is empty.

Definition at line 123 of file interval_filib.h.

10.171.3.89 bool coco::interval::is_empty ( ) const [inline]

Definition at line 157 of file interval_boost.h.

10.171.3.90 bool coco::interval::is_entire ( ) const [inline]

This method checks whether the interval is all $\mathbb{R}$.

Definition at line 116 of file interval_profil.h.

10.171.3.91 bool coco::interval::is_entire ( ) const [inline]

This method checks whether the interval is all $\mathbb{R}$.

Definition at line 134 of file interval_filib.h.

10.171.3.92 bool coco::interval::is_entire ( ) const [inline]

Definition at line 161 of file interval_boost.h.

10.171.3.93 bool coco::interval::is_thin ( ) const [inline]

This method checks whether the interval is thin (contains only one point).

Definition at line 106 of file interval_profil.h.

10.171.3.94 bool coco::interval::is_thin ( ) const [inline]

This method checks whether the interval is thin (contains only one point).

Definition at line 126 of file interval_filib.h.

10.171.3.95 bool coco::interval::is_thin ( ) const [inline]

Definition at line 158 of file interval_boost.h.

10.171.3.96 bool coco::interval::is_unbounded_above ( ) const [inline]

This method checks whether the interval is unbounded above ($[a, \infty]$).

Definition at line 114 of file interval_profil.h.

10.171.3.97 bool coco::interval::is_unbounded_above ( ) const [inline]

This method checks whether the interval is unbounded above ($[a, \infty]$).

Definition at line 132 of file interval_filib.h.

10.171.3.98 bool coco::interval::is_unbounded_above ( ) const [inline]

Definition at line 160 of file interval_boost.h.

10.171.3.99 bool coco::interval::is_unbounded_below ( ) const [inline]

This method checks whether the interval is unbounded below ($[-\infty, a]$).

Definition at line 111 of file interval_profil.h.

10.171.3.100 bool coco::interval::is_unbounded_below ( ) const [inline]

This method checks whether the interval is unbounded below ($[-\infty, a]$).

Definition at line 129 of file interval_filib.h.

10.171.3.101 bool coco::interval::is_unbounded_below ( ) const [inline]

Definition at line 159 of file interval_boost.h.

10.171.3.102 double coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.171.3.103 double coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.171.3.104 double coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.171.3.105 double coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.171.3.106 double coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.171.3.107 double coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.171.3.108 double coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.171.3.109 double coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in x }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.171.3.110 double coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in x }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.171.3.111 interval& coco::interval::operator∗= (const interval & *a*)

Perform plt comparison

Definition at line 209 of file interval_filib.h.

10.171.3.161 bool coco::interval::pne (const interval & *x*) const [inline]

Perform pne comparison

Definition at line 197 of file interval_filib.h.

10.171.3.162 static int const& coco::interval::precision ( ) [static]

This method returns the output precision that is used by the output operator <<.

10.171.3.163 static int coco::interval::precision (int const & *p*) [static]

This method sets the output precision to p. The default value is 3.

10.171.3.164 static int const& coco::interval::precision ( ) [static]

This method returns the output precision that is used by the output operator <<.

10.171.3.165 static int coco::interval::precision (int const & *p*) [static]

This method sets the output precision to p. The default value is 3.

10.171.3.166 static int const& coco::interval::precision ( ) [static]

This method returns the output precision that is used by the output operator <<.

10.171.3.167 static int coco::interval::precision (int const & *p*) [static]

This method sets the output precision to p. The default value is 3.

10.171.3.168 double coco::interval::project (double __*d*) const

This method returns the projection of __d to the interval, i.e. to the double number in the interval which is closest to __d.

10.171.3.169 double coco::interval::project (double __*d*) const

10.171.3.170 double coco::interval::project (double __*d*) const

This method returns the projection of __d to the interval, i.e. to the double number in the interval which is closest to __d.

10.171.3.171 bool coco::interval::proper_subset (const interval & *x*) const [inline]

This method checks whether this interval is a proper subset of x.

Definition at line 127 of file interval_profil.h.

10.171.3.172 bool coco::interval::proper_subset (const interval & *x*) const [inline]

This method checks whether this interval is a proper subset of x.

Definition at line 145 of file interval_filib.h.

10.171.3.173 bool coco::interval::proper_subset (const interval & *x*) const [inline]

Definition at line 169 of file interval_boost.h.

10.171.3.174 bool coco::interval::proper_superset (const interval & *x*) const [inline]

This method checks whether this interval is a proper superset of x.

Definition at line 130 of file interval_profil.h.

10.171.3.175 bool coco::interval::proper_superset (const interval & *x*) const [inline]

This method checks whether this interval is a proper superset of x.

Definition at line 148 of file interval_filib.h.

10.171.3.176 bool coco::interval::proper_superset (const interval & *x*) const [inline]

Definition at line 171 of file interval_boost.h.

10.171.3.177 double coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.171.3.178 double coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.171.3.179 double coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.171.3.180 double coco::interval::rel_width ( ) const

`i.rel_width()` computes the relative width (diameter) of `i`.

10.171.3.181 double coco::interval::rel_width ( ) const

10.171.3.182 double coco::interval::rel_width ( ) const

`i.rel_width()` computes the relative width (diameter) of `i`.

10.171.3.183 double coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.171.3.184 double coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.171.3.185 double coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.171.3.186 interval& coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.171.3.187 interval& coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.171.3.188 double coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.171.3.189 double coco::interval::safeguarded_mid ( ) const

Returns the safeguarded midpoint of this interval, i.e.

a.safeguarded_mid() ==

- 0 if a contains 0,
- $2 * \overline{a}$ if a is unbounded below and does not contain 0,
- $2 * \underline{a}$ if a is unbounded above and does not contain 0,
- the geometric mean of the endpoints if contained in a,
- the arithmetic mean of the endpoints otherwise.

10.171.3.190 double coco::interval::safeguarded_mid ( ) const

Returns the safeguarded midpoint of this interval, i.e.

a.safeguarded_mid() ==

- 0 if a contains 0,
- $2 * \overline{a}$ if a is unbounded below and does not contain 0,
- $2 * \underline{a}$ if a is unbounded above and does not contain 0,
- the geometric mean of the endpoints if contained in a,
- the arithmetic mean of the endpoints otherwise.

10.171.3.191 bool coco::interval::seq (const interval & *x*) const [inline]

Perform seq comparison

Definition at line 158 of file interval_filib.h.

10.171.3.192 void coco::interval::set (double *lo*, double *up*) [inline]

`i.set(lo,up)` sets `i` to [lo,up].

Definition at line 87 of file interval_profil.h.

10.171.3.193 void coco::interval::set (double *lo*, double *up*) [inline]

`i.set(lo,up)` sets `i` to [lo,up].

Definition at line 105 of file interval_filib.h.

10.171.3.194 void coco::interval::set (double *lo*, double *up*) [inline]

Definition at line 144 of file interval_boost.h.

10.171.3.195 void coco::interval::set_bounds (double *a*, double *b*) [inline]

Set the bounds of the interval to a and b.

Definition at line 215 of file interval_profil.h.

10.171.3.196 void coco::interval::set_bounds (double *a*, double *b*) [inline]

Definition at line 244 of file interval_boost.h.

10.171.3.197 void coco::interval::set_bounds (double *a*, double *b*) [inline]

Set the bounds of the interval to `a` and `b`.

Definition at line 287 of file interval_filib.h.

10.171.3.198 void coco::interval::set_lb (double *d*) [inline]

Set the lower bound of the interval to `d`.

Definition at line 217 of file interval_profil.h.

10.171.3.199 void coco::interval::set_lb (double *d*) [inline]

Definition at line 245 of file interval_boost.h.

10.171.3.200 void coco::interval::set_lb (double *d*) [inline]

Set the lower bound of the interval to `d`.

Definition at line 289 of file interval_filib.h.

10.171.3.201 void coco::interval::set_ub (double *d*) [inline]

Set the upper bound of the interval to `d`.

Definition at line 219 of file interval_profil.h.

10.171.3.202 void coco::interval::set_ub (double *d*) [inline]

Definition at line 246 of file interval_boost.h.

10.171.3.203 void coco::interval::set_ub (double *d*) [inline]

Set the upper bound of the interval to `d`.

Definition at line 291 of file interval_filib.h.

10.171.3.204 void coco::interval::setpair (double & *lo*, double & *up*) const [inline]

Set the pair `lo` and `up` to the bounds of the interval.

Definition at line 211 of file interval_profil.h.

10.171.3.205 void coco::interval::setpair (double & *lo*, double & *up*) const [inline]

Definition at line 242 of file interval_boost.h.

10.171.3.206 void coco::interval::setpair (double & *lo*, double & *up*) const [inline]

Set the pair `lo` and `up` to the bounds of the interval.

Definition at line 283 of file interval_filib.h.

10.171.3.207 bool coco::interval::sge (const interval & *x*) const [inline]

Perform sge comparison

Definition at line 164 of file interval_filib.h.

10.171.3.208 bool coco::interval::sgt (const interval & *x*) const [inline]

Perform sgt comparison

Definition at line 167 of file interval_filib.h.

10.171.3.209 bool coco::interval::sle (const interval & *x*) const [inline]

Perform sle comparison

Definition at line 170 of file interval_filib.h.

10.171.3.210 bool coco::interval::slt (const interval & *x*) const [inline]

Perform slt comparison

Definition at line 173 of file interval_filib.h.

10.171.3.211 bool coco::interval::sne (const interval & *x*) const [inline]

Perform sne comparison

Definition at line 161 of file interval_filib.h.

10.171.3.212 bool coco::interval::subset (const interval & *x*) const [inline]

This method checks whether this interval is a subset of `x`.

Definition at line 121 of file interval_profil.h.

10.171.3.213 bool coco::interval::subset (const interval & *x*) const [inline]

This method checks whether this interval is a subset of `x`.

Definition at line 139 of file interval_filib.h.

10.171.3.214 bool coco::interval::subset (const interval & *x*) const [inline]

Definition at line 165 of file interval_boost.h.

10.171.3.215 double coco::interval::sup ( ) const [inline]

This method returns the upper bound of the interval.

Definition at line 111 of file interval_filib.h.

10.171.3.216 double coco::interval::sup ( ) const [inline]

Definition at line 151 of file interval_boost.h.

10.171.3.217 bool coco::interval::superset (const interval & *x*) const [inline]

This method checks whether this interval is a superset of x.

Definition at line 124 of file interval_profil.h.

10.171.3.218 bool coco::interval::superset (const interval & *x*) const [inline]

This method checks whether this interval is a superset of x.

Definition at line 142 of file interval_filib.h.

10.171.3.219 bool coco::interval::superset (const interval & *x*) const [inline]

Definition at line 167 of file interval_boost.h.

10.171.3.220 double coco::interval::width ( ) const

10.171.3.221 double coco::interval::width ( ) const

Returns an upper bound for the diameter (width) of this interval, i.e.

a.diam() == a.sup()-a.inf()

Special cases in the extended system:

- a.diam() == NaN for a == [EMPTY]
- a.diam() == +INF for any infinite interval

10.171.3.222 double coco::interval::width ( ) const

Returns an upper bound for the diameter (width) of this interval, i.e.

a.diam() == a.sup()-a.inf()

Special cases in the extended system:

- a.diam() == NaN for a == [EMPTY]
- a.diam() == +INF for any infinite interval

10.171.4 Friends And Related Function Documentation

10.171.4.1 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.171.4.2 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.171.4.3 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.171.4.4 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.171.4.5 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.171.4.6 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.171.4.7 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.171.4.8 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.171.4.9 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.171.4.10 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.171.4.11 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.171.4.12 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.171.4.13 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.171.4.14 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.171.4.15 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.171.4.16 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.171.4.17 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.171.4.18 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.171.4.19 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.171.4.20 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.171.4.21 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.171.4.22 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.171.4.23 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.171.4.24 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.171.4.25 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.171.4.26 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.171.4.27 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.171.4.28 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.171.4.29 double diam (const interval &) [friend]

diam(a) == a.diam()

10.171.4.30 double dist (const interval & *x*, const interval & *y*) [friend]

Same as x.dist(y)

10.171.4.31 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.171.4.32 interval division_part2 (const interval & *x*, const interval & *y*, bool *b*) [friend]

10.171.4.33 double downward_divides (const double & *a*, const double & *b*) [friend]

This function divides `a` by `b`, rounding downwards.

10.171.4.34 double downward_minus (const double & *a*, const double & *b*) [friend]

This function subtracts `b` from `a`, rounding downwards.

10.171.4.35 double downward_multiplies (const double & *a*, const double & *b*) [friend]

This function multiplies `a` by `b`, rounding downwards.

10.171.4.36 double downward_plus (const double & *a*, const double & *b*) [friend]

This function adds `a` and `b`, rounding downwards.

10.171.4.37 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.171.4.38 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.171.4.39 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.171.4.40 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.171.4.41 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.171.4.42 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.171.4.43 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.171.4.44 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.171.4.45 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.171.4.46 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.171.4.47 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.171.4.48 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.171.4.49 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.171.4.50 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.171.4.51 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.171.4.52 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.171.4.53 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.171.4.54 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.171.4.55 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.171.4.56 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.171.4.57 double mag (const interval &) [friend]

mag(a) == a.mag()

10.171.4.58 double mid (const interval &) [friend]

mid(a) == a.mid()

10.171.4.59 double mig (const interval &) [friend]

mig(a) == a.mig()

10.171.4.60 bool operator!= (const interval & *__i*, const interval & *__d*) [friend]

Comparison operator (not equal)

Definition at line 519 of file expression.h.

10.171.4.90 interval pow (const interval & x, const interval & y) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.171.4.91 interval pow (const interval & x, const interval & y) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.171.4.92 interval power (const interval & x, int n) [friend]

Returns an interval enclosure of x^n.

10.171.4.93 interval power (const interval & x, int n) [friend]

Returns an interval enclosure of x^n.

10.171.4.94 double rad (const interval &) [friend]

rad(a) == a.rad()

10.171.4.95 double relDiam (const interval &) [friend]

relDiam(a) == a.relDiam()

10.171.4.96 interval sin (const interval & x) [friend]

Returns an interval enclosure of the sine of the interval x.

10.171.4.97 interval sin (const interval & x) [friend]

Returns an interval enclosure of the sine of the interval x.

10.171.4.98 interval sinh (const interval & x) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.171.4.99 interval sinh (const interval & x) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.171.4.100 interval sqr (const interval & x) [friend]

Returns an interval enclosure of x^2.

10.171.4.101 interval sqr (const interval & x) [friend]

Returns an interval enclosure of x^2.

10.171.4.102 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.171.4.103 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.171.4.104 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.171.4.105 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.171.4.106 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.171.4.107 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.171.4.108 double upward_divides (const double & *a*, const double & *b*) [friend]

This function divides a by b, rounding upwards.

10.171.4.109 double upward_minus (const double & *a*, const double & *b*) [friend]

This function subtracts b from a, rounding upwards.

10.171.4.110 double upward_multiplies (const double & *a*, const double & *b*) [friend]

This function multiplies a by b, rounding upwards.

10.171.4.111 double upward_plus (const double & *a*, const double & *b*) [friend]

This function adds a and b, rounding upwards.

10.171.4.112 double width (const interval &) [friend]

The documentation for this class was generated from the following files:

- interval_boost.h
- interval_filib.h
- interval_profil.h

10.172 coco::coco::interval Class Reference

10.172.1 Detailed Description

Definition at line 113 of file expression.h.

10.172.2 Constructor & Destructor Documentation

10.172.2.1 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file expression.h.

10.172.2.2 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file expression.h.

10.172.2.3 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file expression.h.

10.172.2.4 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file expression.h.

10.172.2.5 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file expression.h.

10.172.2.6 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file expression.h.

10.172.2.7 coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file expression.h.

10.172.2.8 coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file expression.h.

10.172.2.9 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file expression.h.

10.172.2.10 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file expression.h.

10.172.2.11 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file expression.h.

10.172.2.12 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file expression.h.

10.172.2.13 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file expression.h.

10.172.2.14 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file expression.h.

10.172.2.15 coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file expression.h.

10.172.2.16 coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file expression.h.

10.172.2.17 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file search_graph.cc.

10.172.2.18 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file search_graph.cc.

10.172.2.19 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file search_graph.cc.

10.172.2.20 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file search_graph.cc.

10.172.2.21 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file search_graph.cc.

10.172.2.22 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file search_graph.cc.

10.172.2.23 coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file search_graph.cc.

10.172.2.24 coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file search_graph.cc.

10.172.2.25 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file search_graph.cc.

10.172.2.26 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file search_graph.cc.

10.172.2.27 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file search_graph.cc.

10.172.2.28 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file search_graph.cc.

10.172.2.29 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file search_graph.cc.

10.172.2.30 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file search_graph.cc.

10.172.2.31 coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file search_graph.cc.

10.172.2.32 coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file search_graph.cc.

10.172.2.33 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file search_graph.cc.

10.172.2.34 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file search_graph.cc.

10.172.2.35 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file search_graph.cc.

10.172.2.36 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file search_graph.cc.

10.172.2.37 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file search_graph.cc.

10.172.2.38 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file search_graph.cc.

10.172.2.39 coco::coco::interval::interval (const interval & *x*) [inline]

Definition at line 141 of file search_graph.cc.

10.172.2.40 coco::coco::interval::interval (const interval_st & *x*) [inline]

Definition at line 142 of file search_graph.cc.

10.172.2.41 coco::coco::interval::interval (double *lo,* double *up*) [inline]

Definition at line 135 of file search_graph.cc.

10.172.2.42 coco::coco::interval::interval (double *d* = 0) [inline]

Definition at line 136 of file search_graph.cc.

10.172.2.43 coco::coco::interval::interval (int *d*) [inline]

Definition at line 137 of file search_graph.cc.

10.172.2.44 coco::coco::interval::interval (unsigned *d*) [inline]

Definition at line 138 of file search_graph.cc.

10.172.2.45 coco::coco::interval::interval (long *d*) [inline]

Definition at line 139 of file search_graph.cc.

10.172.2.46 coco::coco::interval::interval (unsigned long *d*) [inline]

Definition at line 140 of file search_graph.cc.

Definition at line 174 of file search_graph.cc.

10.172.3.47 bool coco::coco::interval::disjoint (const interval & *x*) const [inline]

Definition at line 174 of file search_graph.cc.

10.172.3.48 bool coco::coco::interval::disjoint (const interval & *x*) const [inline]

Definition at line 174 of file search_graph.cc.

10.172.3.49 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.50 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.51 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.52 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.53 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.54 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.55 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.56 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.57 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.58 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.59 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

10.172.3.60 double coco::coco::interval::dist (const interval & *x*) const

Returns an upper bound for the Hausdorff distance of this interval and the interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

Definition at line 187 of file search_graph.cc.

10.172.3.145 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.146 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.147 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.148 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.149 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.150 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.151 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.152 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.153 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.154 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.155 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.156 interval& coco::coco::interval::imax (const interval & *x*)

The method changes this interval to the maximum of itself and x.

10.172.3.157 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.158 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.159 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.160 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.161 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.162 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.163 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.164 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.165 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.166 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.167 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

10.172.3.168 interval& coco::coco::interval::imin (const interval & *x*)

The method changes this interval to the minimum of itself and x.

Definition at line 160 of file expression.h.

10.172.3.385 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.386 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.387 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.388 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.389 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.390 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.391 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.392 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.393 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.394 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.395 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.396 double coco::coco::interval::mag ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.397 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.398 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.399 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.400 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.401 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.402 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.403 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.404 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.405 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.406 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.407 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.408 double coco::coco::interval::mid ( ) const

Returns the midpoint of this interval, i.e.

a.mid() == (a.inf()+a.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

10.172.3.409 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.410 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.411 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.412 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.413 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.414 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.415 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.416 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.417 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.418 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.419 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.420 double coco::coco::interval::mig ( ) const

Returns the mignitude of this interval, i.e.

a.mig() == min{abs(y) : y in a }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

10.172.3.661 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.662 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.663 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.664 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.665 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.666 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.667 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.668 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.669 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.670 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.671 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.672 double coco::coco::interval::rad ( ) const

Returns an upper bound for the radius of this interval, i.e.

a.rad() = (a.sup() - a.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite interval

10.172.3.673 double coco::coco::interval::rel_width ( ) const

10.172.3.674 double coco::coco::interval::rel_width ( ) const

10.172.3.675 double coco::coco::interval::rel_width ( ) const

10.172.3.676 double coco::coco::interval::rel_width ( ) const

10.172.3.677 double coco::coco::interval::rel_width ( ) const

10.172.3.678 double coco::coco::interval::rel_width ( ) const

10.172.3.679 double coco::coco::interval::rel_width ( ) const

10.172.3.680 double coco::coco::interval::rel_width ( ) const

10.172.3.681 double coco::coco::interval::rel_width ( ) const

10.172.3.682 double coco::coco::interval::rel_width ( ) const

10.172.3.683 double coco::coco::interval::rel_width ( ) const

10.172.3.684 double coco::coco::interval::rel_width ( ) const

10.172.3.685 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.686 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.687 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.688 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.689 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.690 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.691 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.692 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.693 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.694 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.695 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.696 double coco::coco::interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this interval, i.e.

a.relDiam == a.diam() if a.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite interval

10.172.3.697 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.698 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.699 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.700 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.701 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.702 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.703 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.704 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.705 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.706 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.707 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.708 interval& coco::coco::interval::round_to_integer ( )

This method rounds the interval inward to integer borders.

10.172.3.709 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.710 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.711 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.712 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.713 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.714 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.715 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.716 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.717 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.718 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.719 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.3.720 double coco::coco::interval::safeguarded_mid ( ) const

Returns the magnitude of this interval, i.e.

a.mag() == max{abs(y) : y in a }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite interval

10.172.4 Friends And Related Function Documentation

10.172.4.1 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.2 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.3 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.4 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.5 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.6 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.7 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.8 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.9 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.10 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.11 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.12 interval abs (const interval & *x*) [friend]

Returns an interval enclosure of the absolute value of the interval x.

10.172.4.13 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.14 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.15 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.16 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.17 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.18 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.19 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.20 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.21 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.22 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.23 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.24 interval acos (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cosine of the interval x.

10.172.4.25 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.26 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.27 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.28 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.29 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.30 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.31 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.32 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.33 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.34 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.35 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.36 interval acosh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cosine of the interval x.

10.172.4.37 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.38 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.39 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.40 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.41 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.42 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.43 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.44 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.45 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.46 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.47 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.48 interval acot (const interval & *x*) [friend]

Returns an interval enclosure of the inverse cotangent of the interval x.

10.172.4.49 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.50 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.51 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.52 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.53 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.54 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.55 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.56 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.57 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.58 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.59 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.60 interval acoth (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic cotangent of the interval x.

10.172.4.61 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.62 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.63 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.64 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.65 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.66 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.67 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.68 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.69 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.70 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.71 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.72 interval asin (const interval & *x*) [friend]

Returns an interval enclosure of the inverse sine of the interval x.

10.172.4.73 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.74 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.75 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.76 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.77 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.78 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.79 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.80 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.81 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.82 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.83 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.84 interval asinh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic sine of the interval x.

10.172.4.85 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.86 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.87 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.88 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.89 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.90 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.91 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.92 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.93 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.94 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.95 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.96 interval atan (const interval & *x*) [friend]

Returns an interval enclosure of the inverse tangent of the interval x.

10.172.4.97 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.98 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.99 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.100 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.101 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.102 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.103 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.104 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.105 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.106 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.107 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.108 interval atanh (const interval & *x*) [friend]

Returns an interval enclosure of the inverse hyperbolic tangent of the interval x.

10.172.4.109 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.172.4.110 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.172.4.111 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.172.4.112 interval cancel (const interval & *a,* const interval & *b*) [friend]

10.172.4.113 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.114 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.115 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.116 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.117 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.118 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.119 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.120 interval cancel (const interval & *a*, const interval & *b*) [friend]

10.172.4.121 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.122 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.123 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.124 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.125 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.126 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.127 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.128 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.129 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.130 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.131 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.132 interval cos (const interval & *x*) [friend]

Returns an interval enclosure of the cosine of the interval x.

10.172.4.133 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.134 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.135 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.136 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.137 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.138 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.139 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.140 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.141 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.142 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.143 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.144 interval cosh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cosine of the interval x.

10.172.4.145 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.146 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.147 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.148 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.149 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.150 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.151 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.152 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.153 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.154 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.155 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.156 interval cot (const interval & *x*) [friend]

Returns an interval enclosure of the cotangent of the interval x.

10.172.4.157 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.158 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.159 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.160 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.161 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.162 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.163 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.164 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.165 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.166 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.167 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.168 interval coth (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic cotangent of the interval x.

10.172.4.169 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.170 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.171 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.172 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.173 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval,

division_part1 returns this interval and sets the boolean reference **to** false. However, if the result needs two intervals, division_part1 returns the negative part and sets the boolean reference to true; a call to division_part2 is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be true, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.174 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, division_part1 returns this interval and sets the boolean reference **to** false. However, if the result needs two intervals, division_part1 returns the negative part and sets the boolean reference to true; a call to division_part2 is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be true, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.175 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, division_part1 returns this interval and sets the boolean reference **to** false. However, if the result needs two intervals, division_part1 returns the negative part and sets the boolean reference to true; a call to division_part2 is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be true, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.176 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, division_part1 returns this interval and sets the boolean reference **to** false. However, if the result needs two intervals, division_part1 returns the negative part and sets the boolean reference to true; a call to division_part2 is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be true, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.177 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, division_part1 returns this interval and sets the boolean reference **to** false. However, if the result needs two intervals, division_part1 returns the negative part and sets the boolean reference to true; a call to division_part2 is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be true, and the behavior of the function is then undetermined if the division does not produce a second

interval.

10.172.4.178 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.179 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.180 interval division_part1 (const interval & *x*, const interval & *y*, bool & *b*) [friend]

The division_part? functions return the result of x/y in the following sense, even if the smallest set containing the result is a union of two intervals. For example, the narrowest closed set containg $[2,3]/[-2,1]$ is not $]-\infty,\infty[$ but $]-\infty,-1]\cup[2,\infty[$. When the result of the division is representable by only one interval, `division_part1` returns this interval and sets the boolean reference **to** `false`. However, if the result needs two intervals, `division_part1` returns the negative part and sets the boolean reference to `true`; a call to `division_part2` is now needed to get the positive part. This second function can take the boolean returned by the first function as last argument. If this bool is not given, its value is assumed to be `true`, and the behavior of the function is then undetermined if the division does not produce a second interval.

10.172.4.193 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.194 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.195 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.196 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.197 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.198 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.199 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.200 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.201 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.202 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.203 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.204 interval exp (const interval & *x*) [friend]

Returns an interval enclosure of the exponential of the interval x.

10.172.4.205 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.206 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.207 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.208 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.209 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.210 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.211 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.212 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.213 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.214 interval exp10 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 10) of the interval x.

Returns an interval enclosure of the exponential (base 10) of the interval x.

10.172.4.217 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.218 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.219 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.220 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.221 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.222 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.223 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.224 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.225 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.226 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.227 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.228 interval exp2 (const interval & *x*) [friend]

Returns an interval enclosure of the exponential (base 2) of the interval x.

10.172.4.229 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.230 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.231 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.232 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.233 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.234 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.235 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.236 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.237 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.238 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.239 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.240 interval expm1 (const interval & *x*) [friend]

Returns an interval enclosure of exp(x)-1

10.172.4.241 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.242 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.243 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.244 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.245 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.246 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.247 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.248 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.249 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.250 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.251 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.252 interval imax (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the maximum of two intervals x and y.

10.172.4.253 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.254 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.255 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.256 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.257 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.258 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.259 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.260 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.261 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.262 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.263 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.264 interval imin (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of the minimum of two intervals x and y.

10.172.4.265 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.266 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.267 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.268 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.269 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.270 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.271 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.272 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.273 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.274 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.275 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.276 interval log (const interval & *x*) [friend]

Returns an interval enclosure of the natural logarithm of the interval x.

10.172.4.277 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.278 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.279 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.280 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.281 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.282 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.283 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.284 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.285 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.286 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.287 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.288 interval log10 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 10) of the interval x.

10.172.4.289 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.290 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.291 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.292 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.293 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.294 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.295 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.296 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.297 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.298 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.299 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.300 interval log1p (const interval & *x*) [friend]

Returns an interval enclosure of log(1+x).

10.172.4.301 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.302 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.303 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.304 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.305 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.306 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.307 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.308 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.309 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.310 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.311 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.312 interval log2 (const interval & *x*) [friend]

Returns an interval enclosure of the logarithm (base 2) of the interval x.

10.172.4.313 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.314 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.315 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.316 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.317 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.318 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.319 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.320 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.321 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.322 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.323 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.324 interval operator∗ (const interval & *a*, const interval & *b*) [friend]

This operator computes a∗b as interval.

10.172.4.325 interval operator∗ (const interval & *a*, double *b*) [friend]

10.172.4.326 interval operator∗ (const interval & *a*, double *b*) [friend]

10.172.4.469 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.470 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.471 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.472 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.473 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.474 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.475 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.476 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.477 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.478 interval pow (const interval & *x,* const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.479 interval pow (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.480 interval pow (const interval & *x*, const interval & *y*) [friend]

Returns an interval enclosure of x^y = exp(y∗log(x)).

10.172.4.481 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.482 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.483 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.484 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.485 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.486 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.487 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.488 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.489 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.490 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.491 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.492 interval power (const interval & *x*, int *n*) [friend]

Returns an interval enclosure of x^n.

10.172.4.493 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.494 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.495 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.496 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.497 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.498 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.499 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.500 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.501 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.502 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.503 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.504 interval sin (const interval & *x*) [friend]

Returns an interval enclosure of the sine of the interval x.

10.172.4.505 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.506 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.507 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.508 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.509 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.510 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.511 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.512 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.513 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.514 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.515 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.516 interval sinh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic sine of the interval x.

10.172.4.517 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.518 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.519 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.520 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.521 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.522 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.523 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.524 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.525 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.526 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.527 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.528 interval sqr (const interval & *x*) [friend]

Returns an interval enclosure of x^2.

10.172.4.529 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.530 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.531 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.532 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.533 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.534 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.535 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.536 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.537 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.538 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.539 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.540 interval sqrt (const interval & *x*) [friend]

Returns an interval enclosure of the square root of the interval x.

10.172.4.541 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.542 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.543 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.544 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.545 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.546 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.547 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.548 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.549 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.550 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.551 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.552 interval tan (const interval & *x*) [friend]

Returns an interval enclosure of the tangent of the interval x.

10.172.4.553 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.554 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.555 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.556 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.557 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.558 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.559 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.560 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.561 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.562 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.563 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.172.4.564 interval tanh (const interval & *x*) [friend]

Returns an interval enclosure of the hyperbolic tangent of the interval x.

10.173.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural interval extension.

10.173.2 Member Typedef Documentation

10.173.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.173.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.173.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.173.3 Constructor & Destructor Documentation

10.173.3.1 coco::interval_eval::interval_eval (const std::vector< interval > & __x, const variable_indicator & __v, const model & __m, std::vector< interval > * __c, bool do_i = true) [inline]

Constructor: ___x is the box over which the function range shall be evaluated, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___c the cache (may be NULL). The boolean do_i determines whether the natural interval extension will use known node ranges for reducing the ranges.

Definition at line 141 of file int_evaluator.h.

10.173.3.2 coco::interval_eval::interval_eval (const interval_eval & __v) [inline]

Standard Copy Constructor

Definition at line 155 of file int_evaluator.h.

10.173.3.3 coco::interval_eval::~interval_eval ( ) [inline]

Standard Destructor

Definition at line 158 of file int_evaluator.h.

10.173.4 Member Function Documentation

10.173.4.1 void coco::interval_eval::calculate (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 238 of file int_evaluator.h.

10.173.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.173.4.3 interval coco::interval_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 751 of file int_evaluator.h.

10.173.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.173.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.173.4.6 void coco::interval_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 175 of file int_evaluator.h.

10.173.4.7 int coco::interval_eval::initialize (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 177 of file int_evaluator.h.

10.173.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.173.4.9 bool coco::interval_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< interval_eval_type, expression_node, interval, expression_const_walker >.

Definition at line 86 of file int_evaluator.h.

10.173.4.10 void coco::interval_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 167 of file int_evaluator.h.

10.173.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.173.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.173.4.13 void coco::interval_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 249 of file int_evaluator.h.

10.173.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.173.4.15 expression_const_walker coco::interval_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 161 of file int_evaluator.h.

10.173.4.16 int coco::interval_eval::update (const interval & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 264 of file int_evaluator.h.

10.173.4.17 int coco::interval_eval::update (const expression_node & __data, const interval & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 270 of file int_evaluator.h.

10.173.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.173.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.173.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.173.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.173.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.173.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

- int_evaluator.h

10.174 coco::interval_eval_type Struct Reference

Visitor data for interval_eval.

`#include <int_evaluator.h>`

10.179.1 Constructor & Destructor Documentation

10.179.1.1 Islope::Islope (void) [inline]

Constructor for the slope of the constant function f(x)=0. The slope order is 1.

Definition at line 136 of file Islope.h.

10.179.1.2 Islope::Islope (int *n*) [inline]

Constructor for the slope of order n of the constant function f(x)=0. n has to be 2.

Definition at line 149 of file Islope.h.

10.179.1.3 Islope::Islope (double *a*, int *n*) [inline]

Constructor for the slope of order n of the constant function f(x)=a. n has to be 2.

Definition at line 181 of file Islope.h.

10.179.1.4 Islope::Islope (double *a*, double *b*, int *n*) [inline]

Constructor for the slope of order n of a constant function with f(x) in [a,b], (a+b)/2 is used as middlepoint. n has to be 2.

Definition at line 214 of file Islope.h.

10.179.1.5 Islope::Islope (const Islope & *a*) [inline]

Copy Constructor

Definition at line 246 of file Islope.h.

10.179.1.6 Islope::∼Islope ( ) [virtual]

Deconstructor

Definition at line 9 of file Islope.cc.

10.179.2 Member Function Documentation

10.179.2.1 Islope Islope::getVar (const double & *x*, int *n*) [inline, static]

Constructs a slope of order n for the function f(x)=x at a specific point x. n has to be 2.

Definition at line 288 of file Islope.h.

10.179.2.2 Islope Islope::getVar (const double & *x*, const double & *y*, int *n*) [inline, static]

Constructs a slope of order n for the function f(x)=x in a specific interval [x,y]. (x+y)/2 is used as middlepoint. n has to be 2.

Definition at line 321 of file Islope.h.

10.179.2.3 Islope Islope::getVar (const I & *x*, int *n*) [inline, static]

Constructs a slope of order n for the function f(x)=x in a specific interval [x,y]. (x+y)/2 is used as middlepoint. n has to be 2.

Definition at line 354 of file Islope.h.

10.179.2.4 Islope Islope::getVar (const double & *x*, const double & *y*, const double & *z*, int *n*) [inline, static]

Constructs a slope of order n for the function f(x)=x in a specific interval [x,y]. z is used as middlepoint. n has to be 2.

Definition at line 387 of file Islope.h.

10.179.2.5 Islope & Islope::operator∗= (const Islope & *b*) [inline]

Operator ∗=. Multiplicates slope a with slope b.

Definition at line 905 of file Islope.h.

10.179.2.6 Islope & Islope::operator∗= (const double & *b*) [inline]

Operator ∗=. Multiplicates slope a with double b.

Definition at line 932 of file Islope.h.

10.179.2.7 Islope & Islope::operator+= (const Islope & *b*) [inline]

Operator +=. Adds slope a and b.

Definition at line 819 of file Islope.h.

10.179.2.8 Islope & Islope::operator+= (const double & *b*) [inline]

Operator +=. Adds slope a and double b.

Definition at line 846 of file Islope.h.

10.179.2.9 Islope & Islope::operator-= (const Islope & *b*) [inline]

Operator -=. Subtracts slope b from slope a.

Definition at line 862 of file Islope.h.

10.179.2.10 Islope & Islope::operator-= (const double & *b*) [inline]

Operator -=. Subtracts double b from slope a.

Definition at line 889 of file Islope.h.

10.179.2.11 Islope & Islope::operator/= (const Islope & *b*) [inline]

Operator /=. Divides the slope a by slope b.

Definition at line 952 of file Islope.h.

10.179.2.12 Islope & Islope::operator/= (const double & *b*) [inline]

Operator /=. Divides the slope a by double b.

Definition at line 983 of file Islope.h.

10.179.2.13 Islope & Islope::operator= (const Islope & *a*) [inline]

Operator = for the slope class.

Definition at line 257 of file Islope.h.

10.179.2.14 I & Islope::operator[ ] (int *pos*) const [inline]

Definition at line 279 of file Islope.h.

10.179.2.15 void Islope::setDeg (int *n*) [inline]

Sets the order of the slope to n. If order is set to 1, data[3]-data[6] is deleted. If order is set to 2 data[3]-data[6] is initialized as 0.

Definition at line 420 of file Islope.h.

10.179.3 Member Data Documentation

10.179.3.1 double* Islope::minmaxval

here is the data stored we need for computing the function value of x_min and x_max. x_min and x_max are the bounds of the variable x.

Definition at line 26 of file Islope.h.

10.179.3.2 int Islope::order

the order of the slope. it can be 1 or 2.

Definition at line 24 of file Islope.h.

The documentation for this class was generated from the following files:

- Islope.h
- Islope.cc

10.180.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural Islope extension.

10.180.2 Member Typedef Documentation

10.180.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.180.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.180.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.180.3 Constructor & Destructor Documentation

10.180.3.1 coco::Islope_eval::Islope_eval (const std::vector< Islope > & __x, const variable_indicator & __v, const model & __m, std::vector< Islope > * __c, int __deg) [inline]

Constructor: ___x is the box over which the function range shall be evaluated, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___c the cache (may be NULL). The boolean do_i determines whether the natural Islope extension will use known node ranges for reducing the ranges.

Definition at line 143 of file Islope_evaluator.h.

10.180.3.2 coco::Islope_eval::Islope_eval (const Islope_eval & __v) [inline]

Standard Copy Constructor

Definition at line 158 of file Islope_evaluator.h.

10.180.3.3 coco::Islope_eval::~Islope_eval ( ) [inline]

Standard Destructor

Definition at line 161 of file Islope_evaluator.h.

10.180.4 Member Function Documentation

10.180.4.1 void coco::Islope_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 245 of file Islope_evaluator.h.

10.180.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.180.4.3 Islope coco::Islope_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< Islope_eval_type, expression_node, Islope, expression_const_walker >.

Definition at line 703 of file Islope_evaluator.h.

10.180.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.180.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.180.4.6 void coco::Islope_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< Islope_eval_type, expression_node, Islope, expression_const_walker >.

Definition at line 180 of file Islope_evaluator.h.

10.180.4.7 int coco::Islope_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 182 of file Islope_evaluator.h.

10.180.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The ___data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.180.4.9 bool coco::Islope_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< Islope_eval_type, expression_node, Islope, expression_const_walker >.

Definition at line 88 of file Islope_evaluator.h.

10.180.4.10 void coco::Islope_eval::new_interval (const std::vector< Islope > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation point to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 172 of file Islope_evaluator.h.

10.180.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.180.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.180.4.13 void coco::Islope_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 252 of file Islope_evaluator.h.

10.180.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.180.4.15 expression_const_walker coco::Islope_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 164 of file Islope_evaluator.h.

10.180.4.16 int coco::Islope_eval::update (const Islope & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 257 of file Islope_evaluator.h.

10.180.4.17 int coco::Islope_eval::update (const expression_node & __data, const Islope & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 264 of file Islope_evaluator.h.

10.180.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.180.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.180.4.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.180.4.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.180.4.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.180.4.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.182.4 Member Function Documentation

10.182.4.1 int coco::islp2_eval_INTERNAL::calculate (const expression_node & __data) [inline]

Definition at line 171 of file islp2_evaluator.h.

10.182.4.2 int coco::islp2_eval_INTERNAL::calculate (const expression_node & __data) [inline]

Definition at line 171 of file islp2_evaluator.h.

10.182.4.3 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.182.4.4 bool coco::islp2_eval_INTERNAL::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 412 of file islp2_evaluator.h.

10.182.4.5 bool coco::islp2_eval_INTERNAL::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 412 of file islp2_evaluator.h.

10.182.4.6 void coco::islp2_eval_INTERNAL::cleanup (const expression_node & *__data*) [inline]

Definition at line 311 of file islp2_evaluator.h.

10.182.4.7 void coco::islp2_eval_INTERNAL::cleanup (const expression_node & *__data*) [inline]

Definition at line 311 of file islp2_evaluator.h.

10.182.4.8 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.182.4.9 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.182.4.10 void coco::islp2_eval_INTERNAL::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 160 of file islp2_evaluator.h.

10.182.4.11 void coco::islp2_eval_INTERNAL::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 160 of file islp2_evaluator.h.

10.182.4.12 bool coco::islp2_eval_INTERNAL::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 68 of file islp2_evaluator.h.

10.182.4.13 bool coco::islp2_eval_INTERNAL::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp2_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 68 of file islp2_evaluator.h.

10.182.4.14 void coco::islp2_eval_INTERNAL::newPoint (std::vector< std::vector< interval > > * *__c_data*, std::vector< std::vector< interval > > * *__d_data*, std::vector< std::vector< interval > > * *__h_data*, const variable_indicator & *__v*) [inline]

Definition at line 130 of file islp2_evaluator.h.

10.182.4.15 void coco::islp2_eval_INTERNAL::newPoint (std::vector< std::vector< interval > > * *__c_data*, std::vector< std::vector< interval > > * *__d_data*, std::vector< std::vector< interval > > * *__h_data*, const variable_indicator & *__v*) [inline]

Definition at line 130 of file islp2_evaluator.h.

10.182.4.16 void coco::islp2_eval_INTERNAL::newResult (std::vector< interval > * *__islp*, std::vector< interval > * *__islp2*) [inline]

Definition at line 142 of file islp2_evaluator.h.

10.182.4.17 void coco::islp2_eval_INTERNAL::newResult (std::vector< interval > * __islp, std::vector< interval > * __islp2) [inline]

Definition at line 142 of file islp2_evaluator.h.

10.182.4.18 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.182.4.19 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.182.4.20 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.182.4.21 void coco::islp2_eval_INTERNAL::set_mult (interval scal) [inline]

Definition at line 148 of file islp2_evaluator.h.

10.182.4.22 void coco::islp2_eval_INTERNAL::set_mult (interval scal) [inline]

Definition at line 148 of file islp2_evaluator.h.

10.182.4.23 expression_const_walker coco::islp2_eval_INTERNAL::short_cut_to (const expression_node & __data) [inline]

Definition at line 156 of file islp2_evaluator.h.

10.182.4.24 expression_const_walker coco::islp2_eval_INTERNAL::short_cut_to (const expression_node & __data) [inline]

Definition at line 156 of file islp2_evaluator.h.

10.182.4.25 int coco::islp2_eval_INTERNAL::update (const bool & __rval) [inline]

Definition at line 349 of file islp2_evaluator.h.

10.182.4.26 int coco::islp2_eval_INTERNAL::update (const bool & *__rval*) [inline]

Definition at line 349 of file islp2_evaluator.h.

10.182.4.27 int coco::islp2_eval_INTERNAL::update (const expression_node & *__data,* const bool & *__rval*) [inline]

Definition at line 359 of file islp2_evaluator.h.

10.182.4.28 int coco::islp2_eval_INTERNAL::update (const expression_node & *__data,* const bool & *__rval*) [inline]

Definition at line 359 of file islp2_evaluator.h.

10.182.4.29 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.182.4.30 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & *__data,* const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.182.4.31 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.182.4.32 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.182.4.33 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.182.4.34 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.186.1 Detailed Description

This class is a cached backward evaluator performing a first order slope evaluation with available partial first order slope information.

Definition at line 55 of file islp_evaluator.h.

10.186.2 Member Typedef Documentation

10.186.2.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.186.2.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.186.2.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.186.3 Constructor & Destructor Documentation

10.186.3.1 coco::islp_eval_INTERNAL::islp_eval_INTERNAL (std::vector< std::vector< interval > > & __slp_data, variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > * __d, std::vector< interval > & __islp) [inline]

Constructor: __slp_data contains the partial first order slope information, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, and __d the cache (may be NULL). Eventually, __islp is a reference to the result vector. This vector must have the correct length and has to be initialized with zero, since all components are actually computed by adding to the components of __islp.

Definition at line 90 of file islp_evaluator.h.

10.186.4 Member Function Documentation

10.186.4.1 int coco::islp_eval_INTERNAL::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 155 of file islp_evaluator.h.

10.186.4.2 int coco::islp_eval_INTERNAL::calculate (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 155 of file islp_evaluator.h.

10.186.4.3 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.186.4.4 bool coco::islp_eval_INTERNAL::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 267 of file islp_evaluator.h.

10.186.4.5 bool coco::islp_eval_INTERNAL::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 267 of file islp_evaluator.h.

10.186.4.6 void coco::islp_eval_INTERNAL::cleanup (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 218 of file islp_evaluator.h.

10.186.4.7 void coco::islp_eval_INTERNAL::cleanup (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 218 of file islp_evaluator.h.

10.186.4.8 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.186.4.9 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.186.4.10 void coco::islp_eval_INTERNAL::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 149 of file islp_evaluator.h.

10.186.4.11 void coco::islp_eval_INTERNAL::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 149 of file islp_evaluator.h.

10.186.4.12 bool coco::islp_eval_INTERNAL::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the first order slope for this node is already available.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 67 of file islp_evaluator.h.

10.186.4.13 bool coco::islp_eval_INTERNAL::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the first order slope for this node is already available.

Reimplemented from coco::coco::cached_backward_evaluator_base< islp_eval_type_INTERNAL, expression_node, bool, expression_const_walker >.

Definition at line 67 of file islp_evaluator.h.

10.186.4.14 void coco::islp_eval_INTERNAL::new_point (std::vector< std::vector< interval > > & __slp_data, const variable_indicator & __v) [inline]

This method changes the partial first order slope data to __slp_data. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 122 of file islp_evaluator.h.

10.186.4.15 void coco::islp_eval_INTERNAL::new_point (std::vector< std::vector< interval > > & __slp_data, const variable_indicator & __v) [inline]

This method changes the partial first order slope data to __slp_data. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 122 of file islp_evaluator.h.

10.186.4.16 void coco::islp_eval_INTERNAL::new_result (std::vector< interval > & __islp) [inline]

This method changes the result vector to __islp.

Definition at line 130 of file islp_evaluator.h.

10.186.4.17 void coco::islp_eval_INTERNAL::new_result (std::vector< interval > & __islp) [inline]

This method changes the result vector to __islp.

Definition at line 130 of file islp_evaluator.h.

10.186.4.18 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.186.4.19 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.186.4.20 void coco::islp_eval_INTERNAL::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 230 of file islp_evaluator.h.

10.186.4.21 void coco::islp_eval_INTERNAL::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 230 of file islp_evaluator.h.

10.186.4.22 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.186.4.23 void coco::islp_eval_INTERNAL::set_mult (interval *scal*) [inline]

This method causes the slope to be multiplied by `scal`.

Definition at line 136 of file islp_evaluator.h.

10.186.4.24 void coco::islp_eval_INTERNAL::set_mult (interval *scal*) [inline]

This method causes the slope to be multiplied by `scal`.

Definition at line 136 of file islp_evaluator.h.

10.186.4.25 expression_const_walker coco::islp_eval_INTERNAL::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 143 of file islp_evaluator.h.

10.186.4.26 expression_const_walker coco::islp_eval_INTERNAL::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 143 of file islp_evaluator.h.

10.186.4.27 int coco::islp_eval_INTERNAL::update (const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 238 of file islp_evaluator.h.

10.186.4.28 int coco::islp_eval_INTERNAL::update (const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 238 of file islp_evaluator.h.

10.186.4.29 int coco::islp_eval_INTERNAL::update (const expression_node & *__data,* const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 245 of file islp_evaluator.h.

10.186.4.30 int coco::islp_eval_INTERNAL::update (const expression_node & *__data,* const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 245 of file islp_evaluator.h.

10.186.4.31 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.186.4.32 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.186.4.33 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 892 of file search_graph.cc.

10.186.4.34 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.186.4.35 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.186.4.36 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.187.1 Detailed Description

This class is a cached backward evaluator performing a first order slope evaluation with available partial first order slope information.

10.187.2 Constructor & Destructor Documentation

10.187.2.1 islp_eval_INTERNAL::islp_eval_INTERNAL (std::vector< std::vector< interval > > & __slp_data, variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > * __d, std::vector< interval > & __islp) [inline]

Constructor: ___slp_data contains the partial first order slope information, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___d the cache (may be NULL). Eventually, ___islp is a reference to the result vector. This vector must have the correct length and has to be initialized with zero, since all components are actually computed by adding to the components of ___islp.

Definition at line 89 of file islp_evaluator_tmpl.h.

10.187.2.2 islp_eval_INTERNAL::islp_eval_INTERNAL (const islp_eval_INTERNAL & __d) [inline]

Standard Copy Constructor

10.187.3 Member Function Documentation

10.187.3.1 int islp_eval_INTERNAL::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 154 of file islp_evaluator_tmpl.h.

10.187.3.2 bool islp_eval_INTERNAL::calculate_value (bool eval_all) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 266 of file islp_evaluator_tmpl.h.

10.187.3.3 void islp_eval_INTERNAL::cleanup (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 217 of file islp_evaluator_tmpl.h.

10.187.3.4 void islp_eval_INTERNAL::initialize ( ) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 148 of file islp_evaluator_tmpl.h.

10.187.3.5 bool islp_eval_INTERNAL::is_cached (const node_data_type & *__data*) [inline, protected]

This function determines, whether the first order slope for this node is already available.

Definition at line 66 of file islp_evaluator_tmpl.h.

10.187.3.6 void islp_eval_INTERNAL::new_point (std::vector< std::vector< interval > > & *__slp_data,* const variable_indicator & *__v*) [inline]

This method changes the partial first order slope data to `___slp_data`. The parameter `___v` specifies which variables have changed value since the last evaluation.

Definition at line 121 of file islp_evaluator_tmpl.h.

10.187.3.7 void islp_eval_INTERNAL::new_result (std::vector< interval > & *__islp*) [inline]

This method changes the result vector to `___islp`.

Definition at line 129 of file islp_evaluator_tmpl.h.

10.187.3.8 void islp_eval_INTERNAL::retrieve_from_cache (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 229 of file islp_evaluator_tmpl.h.

10.187.3.9 void islp_eval_INTERNAL::set_mult (interval *scal*) [inline]

This method causes the slope to be multiplied by `scal`.

Definition at line 135 of file islp_evaluator_tmpl.h.

10.187.3.10 expression_const_walker islp_eval_INTERNAL::short_cut_to (const expression_node & *__data*) [inline]

NOP version, not needed

Definition at line 142 of file islp_evaluator_tmpl.h.

10.187.3.11 int islp_eval_INTERNAL::update (const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 237 of file islp_evaluator_tmpl.h.

10.187.3.12 int islp_eval_INTERNAL::update (const expression_node & *__data,* const bool & *__rval*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 244 of file islp_evaluator_tmpl.h.

10.190.3 Member Function Documentation

10.190.3.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.190.3.2 int coco::ithirdderBackwardEvaluator::calculate (const expression_node & *__data*) [inline]

Definition at line 1735 of file ithirdder_evaluator.h.

10.190.3.3 bool coco::ithirdderBackwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< ithirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1976 of file ithirdder_evaluator.h.

10.190.3.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.190.3.5 void coco::ithirdderBackwardEvaluator::cleanup (const expression_node & *__data*) [inline]

Definition at line 1864 of file ithirdder_evaluator.h.

10.190.3.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.190.3.7 void coco::ithirdderBackwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< ithirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1724 of file ithirdder_evaluator.h.

10.190.3.8 bool coco::ithirdderBackwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< ithirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1621 of file ithirdder_evaluator.h.

10.190.3.9 void coco::ithirdderBackwardEvaluator::newPoint (std::vector< std::vector< interval > > * __der_data, std::vector< std::vector< interval > > * __hessv_data, std::vector< std::vector< interval > > * __hessw_data, std::vector< std::vector< interval > > * __ithirdder_data, const variable_indicator & __v) [inline]

Definition at line 1686 of file ithirdder_evaluator.h.

10.190.3.10 void coco::ithirdderBackwardEvaluator::newResult (std::vector< interval > * __grad, std::vector< interval > * __hessv, std::vector< interval > * __hessw, std::vector< interval > * __ithirdder) [inline]

Definition at line 1702 of file ithirdder_evaluator.h.

10.190.3.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.190.3.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.190.3.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.190.3.14 void coco::ithirdderBackwardEvaluator::set_mult (interval scal) [inline]

Definition at line 1711 of file ithirdder_evaluator.h.

10.190.3.15 expression_const_walker coco::ithirdderBackwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 1720 of file ithirdder_evaluator.h.

10.190.3.16 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.190.3.17 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.190.3.18 int coco::ithirdderBackwardEvaluator::update (const bool & __rval) [inline]

Definition at line 1902 of file ithirdder_evaluator.h.

10.190.3.19 int coco::ithirdderBackwardEvaluator::update (const expression_node & *__data*, const bool & *__rval*) [inline]

Definition at line 1912 of file ithirdder_evaluator.h.

10.190.3.20 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.190.3.21 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.190.3.22 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.190.3.23 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

The documentation for this class was generated from the following file:

- ithirdder_evaluator.h

10.191 coco::ithirdderBackwardEvaluatorType Struct Reference

10.192.1 Member Typedef Documentation

10.192.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.192.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.192.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.192.2 Constructor & Destructor Documentation

10.192.2.1 coco::ithirdderForwardEvaluator::ithirdderForwardEvaluator (const std::vector< ihessNumber > & __x, const std::vector< interval > & __rg, const variable_indicator & __v, const model & __m, std::vector< std::vector< interval > > & __d, std::vector< std::vector< interval > > & __hv, std::vector< std::vector< interval > > & __hw, std::vector< std::vector< interval > > & __t, std::vector< ihessNumber > * __c, bool *inters* = true, const std::vector< interval > * *_center* = NULL) [inline]

Definition at line 268 of file ithirdder_evaluator.h.

10.192.2.2 coco::ithirdderForwardEvaluator::ithirdderForwardEvaluator (const ithirdderForwardEvaluator & __x) [inline]

Definition at line 300 of file ithirdder_evaluator.h.

10.192.2.3 coco::ithirdderForwardEvaluator::~ithirdderForwardEvaluator ( ) [inline]

Definition at line 304 of file ithirdder_evaluator.h.

10.192.3 Member Function Documentation

10.192.3.1 void coco::ithirdderForwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 429 of file ithirdder_evaluator.h.

10.192.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.192.3.3 ithirdderForwardEvaluatorReturnValue coco::ithirdderForwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< ithirdderForwardEvaluatorType, expression_node, ithirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 1573 of file ithirdder_evaluator.h.

10.192.3.4 void coco::ithirdderForwardEvaluator::changeIntersectBehaviour (bool *intersect*) [inline]

Definition at line 338 of file ithirdder_evaluator.h.

10.192.3.5 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.192.3.6 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.192.3.7 void coco::ithirdderForwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< ithirdderForwardEvaluatorType, expression_node, ithirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 343 of file ithirdder_evaluator.h.

10.192.3.8 int coco::ithirdderForwardEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 351 of file ithirdder_evaluator.h.

10.192.3.9 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.192.3.10 bool coco::ithirdderForwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< ithirdderForwardEvaluatorType, expression_node, ithirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 195 of file ithirdder_evaluator.h.

10.192.3.11 void coco::ithirdderForwardEvaluator::newCenter (const std::vector< interval > * _center) [inline]

This method changes the center for centered forms to _center.

Definition at line 333 of file ithirdder_evaluator.h.

10.192.3.12 void coco::ithirdderForwardEvaluator::newPoint (const std::vector< ihessNumber > & __x, const variable_indicator & __v) [inline]

Definition at line 309 of file ithirdder_evaluator.h.

10.192.3.13 void coco::ithirdderForwardEvaluator::newRange (const std::vector< interval > & __rg, const variable_indicator & __v) [inline]

This method changes the node ranges to ___rg. The parameter * ___v specifies which variables have changed value since the last * evaluation.

Definition at line 326 of file ithirdder_evaluator.h.

10.192.3.14 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.192.3.15 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.192.3.16 void coco::ithirdderForwardEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 438 of file ithirdder_evaluator.h.

10.192.3.17 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.192.3.18 expression_const_walker coco::ithirdderForwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 306 of file ithirdder_evaluator.h.

10.192.3.19 int coco::ithirdderForwardEvaluator::update (const ihessNumber & __rval) [inline]

Definition at line 445 of file ithirdder_evaluator.h.

10.192.3.20 int coco::ithirdderForwardEvaluator::update (const expression_node & __data, const ithirdderForwardEvaluatorReturnValue & __rval) [inline]

Definition at line 455 of file ithirdder_evaluator.h.

10.192.3.21 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.192.3.22 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.192.3.23 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.192.3.24 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.192.3.25 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.192.3.26 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.195.1 Member Typedef Documentation

10.195.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.195.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.195.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.195.2 Constructor & Destructor Documentation

10.195.2.1 coco::ithirdderPreparationEvaluator::ithirdderPreparationEvaluator (std::vector< std::vector< interval > > & __d, std::vector< std::vector< interval > > & __hv, std::vector< std::vector< interval > > & __hw, std::vector< std::vector< interval > > & __t, unsigned int _num_of_nodes) [inline]

Definition at line 89 of file ithirdder_evaluator.h.

10.195.2.2 coco::ithirdderPreparationEvaluator::ithirdderPreparationEvaluator (const ithirdderPreparationEvaluator & __x) [inline]

Definition at line 109 of file ithirdder_evaluator.h.

10.195.2.3 coco::ithirdderPreparationEvaluator::~ithirdderPreparationEvaluator ( ) [inline]

Definition at line 115 of file ithirdder_evaluator.h.

10.195.3 Member Function Documentation

10.195.3.1 void coco::ithirdderPreparationEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 140 of file ithirdder_evaluator.h.

10.195.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.195.3.3 bool coco::ithirdderPreparationEvaluator::calculate_value (bool eval_all) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< ithirdderPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 152 of file ithirdder_evaluator.h.

10.195.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.195.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.195.3.6 void coco::ithirdderPreparationEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< ithirdderPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 117 of file ithirdder_evaluator.h.

10.195.3.7 int coco::ithirdderPreparationEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 126 of file ithirdder_evaluator.h.

10.195.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.195.3.9 bool coco::ithirdderPreparationEvaluator::is_cached (const expression_node & __data) [inline]

Definition at line 119 of file ithirdder_evaluator.h.

10.195.3.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.195.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.195.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.195.3.13 void coco::ithirdderPreparationEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 124 of file ithirdder_evaluator.h.

10.195.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.195.3.15 int coco::ithirdderPreparationEvaluator::update (bool __rval) [inline]

Definition at line 142 of file ithirdder_evaluator.h.

10.195.3.16 int coco::ithirdderPreparationEvaluator::update (const expression_node & __data, bool __rval) [inline]

Definition at line 144 of file ithirdder_evaluator.h.

10.195.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.195.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.195.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 763 of file search_graph.cc.

10.195.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.195.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.195.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter true.

Definition at line 768 of file search_graph.cc.

10.197.1 Detailed Description

This cached backward evaluator is used to collect the coefficients of a linear node on a DAG.

10.197.2 Member Typedef Documentation

10.197.2.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.197.2.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.197.2.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.197.3 Constructor & Destructor Documentation

10.197.3.1 coco::model::lincoeff_visitor::lincoeff_visitor (const std::vector< interval > * _rg, vmtl::sparse_vector< double > * _cf, double * _cs, const model * _m) [inline]

Constructor, which initializes the node ranges `ranges` with `_rg`, the results `coeffs` and `constant` with `_cf` and `_cs`, respectively, and the model `mod` with `_m`.

Definition at line 2458 of file model.hpp.

10.197.3.2 coco::model::lincoeff_visitor::lincoeff_visitor (const lincoeff_visitor & __x) [inline]

Standard Copy Constructor

Definition at line 2478 of file model.hpp.

10.197.3.3 coco::model::lincoeff_visitor::~lincoeff_visitor ( ) [inline]

Standard Destructor

Definition at line 2481 of file model.hpp.

10.197.4 Member Function Documentation

10.197.4.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.197.4.2 int coco::model::lincoeff_visitor::calculate (const expression_node & __data) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2540 of file model.hpp.

10.197.4.3 lincoeff_visitor_ret coco::model::lincoeff_visitor::calculate_value (bool *eval_all*) [inline, virtual]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Reimplemented from coco::coco::cached_backward_evaluator_base< lincoeff_visitor_st, expression_node, lincoeff_visitor_ret, model::const_walker >.

Definition at line 3196 of file model.hpp.

10.197.4.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.197.4.5 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.197.4.6 void coco::model::lincoeff_visitor::initialize ( ) [inline, virtual]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Reimplemented from coco::coco::cached_backward_evaluator_base< lincoeff_visitor_st, expression_node, lincoeff_visitor_ret, model::const_walker >.

Definition at line 2497 of file model.hpp.

10.197.4.7 void coco::model::lincoeff_visitor::initialize (const expression_node & *__data*) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2508 of file model.hpp.

10.197.4.8 virtual bool coco::coco::cached_backward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 906 of file search_graph.cc.

10.197.4.9 bool coco::model::lincoeff_visitor::is_cached (const expression_node & __data) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2486 of file model.hpp.

10.197.4.10 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.197.4.11 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.197.4.12 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.197.4.13 void coco::model::lincoeff_visitor::retrieve_from_cache (const expression_node & __data) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2519 of file model.hpp.

10.197.4.14 virtual const_walker coco::model::lincoeff_visitor::short_cut_to (const expression_node & __data) [inline, virtual]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2492 of file model.hpp.

10.197.4.15 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.197.4.16 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.197.4.17 int coco::model::lincoeff_visitor::update (const expression_node & __data, const lincoeff_visitor_ret & __rval) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 2651 of file model.hpp.

10.197.4.18 int coco::model::lincoeff_visitor::update (const lincoeff_visitor_ret & __rval) [inline]

This is a method as needed by a cached backward evaluator.

See also

cached_backward_evaluator_base.

Definition at line 3188 of file model.hpp.

10.197.4.19 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.197.4.20 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.197.4.21 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.197.4.22 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.201.1 Detailed Description

This class is a work node computation hook (see work_node_comp_hook), which calculates the log-volume of the work node (from the bound constraints) and keeps it in column "logvol".

10.201.2 Constructor & Destructor Documentation

10.201.2.1 coco::logvol_comp_hook::logvol_comp_hook ( ) [inline]

Standard Constructor

Definition at line 46 of file logvol_hook.h.

10.201.2.2 virtual coco::logvol_comp_hook::~logvol_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 49 of file logvol_hook.h.

10.201.3 Member Function Documentation

10.201.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.201.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 238 of file comp_hook.h.

10.201.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 135 of file comp_hook.h.

10.201.3.4 bool coco::logvol_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the column "logvol" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 69 of file logvol_hook.h.

10.201.3.5 bool coco::logvol_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "logvol" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 64 of file logvol_hook.h.

10.201.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.201.3.7 logvol_comp_hook* coco::logvol_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 52 of file logvol_hook.h.

10.201.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node wn.

Definition at line 43 of file comp_hook.cc.

10.201.3.9 void coco::logvol_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *a* = NULL, std::list< certificate > * *b* = NULL) const [inline, virtual]

The evaluation operator of this computation hook. It stores the log-volume of the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 56 of file logvol_hook.h.

10.201.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following file:

- logvol_hook.h

10.202.1 Detailed Description

This is the base class of all COCONUT management modules. A management module specializes in performing changes to the internal data structures.

10.202.2 Constructor & Destructor Documentation

10.202.2.1 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*, gptr< vdbl::database > & *dbase*) [inline]

This is the most general constructor for a management module containing parameters for setting all internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, sinsp sets __sinsp, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 94 of file mgmt_module.h.

10.202.2.2 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, sinsp sets __sinsp, and sgraph sets __sgraph.

Definition at line 108 of file mgmt_module.h.

10.202.2.3 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, sinsp sets __sinsp, and dbase sets __dbase.

Definition at line 121 of file mgmt_module.h.

10.202.2.4 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sinsp sets __sinsp, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 134 of file mgmt_module.h.

10.202.2.5 coco::management_module::management_module (const std::string & *__n*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sinsp sets __sinsp, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 147 of file mgmt_module.h.

10.202.2.6 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, search_focus & *sfoc*, const search_inspector * *sinsp*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, and sinsp sets __sinsp.

Definition at line 160 of file mgmt_module.h.

10.202.2.7 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, const search_inspector * *sinsp*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sinsp sets __sinsp, and dbase sets __dbase.

Definition at line 172 of file mgmt_module.h.

10.202.2.8 coco::management_module::management_module (const std::string & *__n*, gptr< work_node > & *wnode*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sinsp sets __sinsp, and sgraph sets __sgraph.

Definition at line 184 of file mgmt_module.h.

10.202.2.9 coco::management_module::management_module (const std::string & *__n*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< search_graph > & *sgraph*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sinsp sets __sinsp, and sgraph sets __sgraph.

Definition at line 196 of file mgmt_module.h.

10.202.2.10 coco::management_module::management_module (const std::string & *__n*, search_focus & *sfoc*, const search_inspector * *sinsp*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sinsp sets __sinsp, and dbase sets __dbase.

Definition at line 208 of file mgmt_module.h.

10.202.2.11 coco::management_module::management_module (const std::string & __n, const search_inspector * sinsp, gptr< search_graph > & sgraph, gptr< vdbl::database > & dbase) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sinsp sets __sinsp, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 220 of file mgmt_module.h.

10.202.2.12 coco::management_module::management_module (const std::string & __n, gptr< work_node > & wnode, const search_inspector * sinsp) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and sinsp sets __sinsp.

Definition at line 231 of file mgmt_module.h.

10.202.2.13 coco::management_module::management_module (const std::string & __n, search_focus & sfoc, const search_inspector * sinsp) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sinsp sets __sinsp.

Definition at line 240 of file mgmt_module.h.

10.202.2.14 coco::management_module::management_module (const std::string & __n, const search_inspector * sinsp, gptr< search_graph > & sgraph) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sinsp sets __sinsp, and sgraph sets __sgraph.

Definition at line 249 of file mgmt_module.h.

10.202.2.15 coco::management_module::management_module (const std::string & __n, const search_inspector * sinsp, gptr< vdbl::database > & dbase) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sinsp sets __sinsp, and dbase sets __dbase.

Definition at line 258 of file mgmt_module.h.

10.202.2.16 coco::management_module::management_module (const std::string & __n, gptr< work_node > & wnode, search_focus & sfoc, gptr< search_graph > & sgraph, gptr< vdbl::database > & dbase) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 268 of file mgmt_module.h.

10.202.2.17 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, search_focus & *sfoc*, gptr< search_graph > & *sgraph*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, and sgraph sets __sgraph.

Definition at line 281 of file mgmt_module.h.

10.202.2.18 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, search_focus & *sfoc*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sfoc sets __sfocus, and dbase sets __dbase.

Definition at line 293 of file mgmt_module.h.

10.202.2.19 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, gptr< search_graph > & *sgraph*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 305 of file mgmt_module.h.

10.202.2.20 coco::management_module::management_module (const std::string & __n, search_focus & *sfoc*, gptr< search_graph > & *sgraph*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 317 of file mgmt_module.h.

10.202.2.21 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, search_focus & *sfoc*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and sfoc sets __sfocus.

Definition at line 328 of file mgmt_module.h.

10.202.2.22 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and dbase sets __dbase.

Definition at line 338 of file mgmt_module.h.

10.202.2.23 coco::management_module::management_module (const std::string & __n, gptr< work_node > & *wnode*, gptr< search_graph > & *sgraph*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and sgraph sets __sgraph.

Definition at line 348 of file mgmt_module.h.

10.202.2.24 coco::management_module::management_module (const std::string & __n, search_focus & sfoc, gptr< search_graph > & sgraph) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, and sgraph sets __sgraph.

Definition at line 358 of file mgmt_module.h.

10.202.2.25 coco::management_module::management_module (const std::string & __n, search_focus & sfoc, gptr< vdbl::database > & dbase) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sfoc sets __sfocus, and dbase sets __dbase.

Definition at line 368 of file mgmt_module.h.

10.202.2.26 coco::management_module::management_module (const std::string & __n, gptr< search_graph > & sgraph, gptr< vdbl::database > & dbase) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, sgraph sets __sgraph, and dbase sets __dbase.

Definition at line 378 of file mgmt_module.h.

10.202.2.27 coco::management_module::management_module (const std::string & __n, gptr< work_node > & wnode) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, and wnode sets __wnode.

Definition at line 388 of file mgmt_module.h.

10.202.2.28 coco::management_module::management_module (const std::string & __n, search_focus & sfoc) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name, and sfoc sets __sfocus.

Definition at line 396 of file mgmt_module.h.

10.202.2.29 coco::management_module::management_module (const std::string & __n, const search_inspector * sinsp) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name and sinsp sets __sinsp.

Definition at line 404 of file mgmt_module.h.

10.202.2.30 coco::management_module::management_module (const std::string & __n, gptr< search_graph > & sgraph) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter __n sets __name and sgraph sets __sgraph.

Definition at line 412 of file mgmt_module.h.

10.202.2.31 coco::management_module::management_module (const std::string & *__n*, gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a management module containing parameters for setting some internal variables. The parameter ___n sets __name and dbase sets __dbase.

Definition at line 420 of file mgmt_module.h.

10.202.2.32 virtual coco::management_module::~management_module ( ) [inline, virtual]

Standard Destructor

Definition at line 426 of file mgmt_module.h.

10.202.3 Member Function Documentation

10.202.3.1 const model* coco::management_module::get_model ( ) const [inline]

A call to this method returns a pointer to the model of the work node.

Definition at line 429 of file mgmt_module.h.

10.202.3.2 const std::string& coco::management_module::get_name ( ) const [inline]

The get_name method returns the identifier string of the management module.

Definition at line 434 of file mgmt_module.h.

10.202.3.3 virtual int coco::management_module::manage (const control_data & *_c*) [inline, virtual]

This method is the main method of a management module. It is supposed to perform changes to some internal data structure. It returns a status value. Here 0 denotes success. All other return values signal some error or warning. Service information and parameters are provided via the control_data structure _c.

Definition at line 441 of file mgmt_module.h.

10.202.4 Member Data Documentation

10.202.4.1 gptr<vdbl::database>* coco::management_module::__dbase [protected]

This variable contains a global pointer to the search database.

Definition at line 85 of file mgmt_module.h.

10.202.4.2 std::string coco::management_module::__name [protected]

This is the identifier string for a management module.

Definition at line 77 of file mgmt_module.h.

10.202.4.3 search_focus* coco::management_module::__sfocus [protected]

This variable contains a pointer to the search focus.

Definition at line 81 of file mgmt_module.h.

10.202.4.4 gptr<search_graph>* coco::management_module::__sgraph [protected]

This variable contains a global pointer to the search graph.

Definition at line 87 of file mgmt_module.h.

10.202.4.5 const search_inspector* coco::management_module::__sinsp [protected]

This variable contains a pointer to a search inspector

Definition at line 83 of file mgmt_module.h.

10.202.4.6 gptr<work_node>* coco::management_module::__wnode [protected]

This variable contains a global pointer to the work node.

Definition at line 79 of file mgmt_module.h.

10.203.1 Detailed Description

This is the exceptions class thrown by management module subclasses. Every properly coded COCONUT management module should only throw exceptions of this type.

10.203.2 Constructor & Destructor Documentation

10.203.2.1 coco::management_module_exception::management_module_exception (const std::string & *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 57 of file mgmt_module.h.

10.203.2.2 coco::management_module_exception::management_module_exception (const char * *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 60 of file mgmt_module.h.

10.203.2.3 virtual coco::management_module_exception::~management_module_exception ( ) throw () [inline, virtual]

Standard Destructor

Definition at line 64 of file mgmt_module.h.

10.203.3 Member Function Documentation

10.203.3.1 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file expression.h.

10.203.3.2 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.203.3.3 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.203.3.4 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.203.3.5 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.203.3.6 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.203.3.7 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.203.3.8 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file expression.h.

10.203.3.9 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.203.3.10 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.203.3.11 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.203.3.12 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.203.3.13 const char * coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

Definition at line 57 of file api_exception.cc.

10.203.3.14 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.203.3.15 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.203.3.16 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.203.3.17 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.203.3.18 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file expression.h.

10.203.3.19 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.203.3.20 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

- search_node_id node_id (const work_node &wn) const

10.204.1 Detailed Description

This class is a work node computation hook (see work_node_comp_hook), which calculates the memory of the work node (from the bound constraints) and keeps it in column "memory".

10.204.2 Constructor & Destructor Documentation

10.204.2.1 coco::memory_comp_hook::memory_comp_hook ( ) [inline]

Standard Constructor

Definition at line 46 of file memory_hook.h.

10.204.2.2 virtual coco::memory_comp_hook::~memory_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 49 of file memory_hook.h.

10.204.3 Member Function Documentation

10.204.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.204.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 238 of file comp_hook.h.

10.204.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 135 of file comp_hook.h.

10.204.3.4 bool coco::memory_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the column "memory" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 79 of file memory_hook.h.

10.204.3.5 bool coco::memory_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "memory" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 74 of file memory_hook.h.

10.204.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.204.3.7 memory_comp_hook* coco::memory_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 52 of file memory_hook.h.

10.204.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.204.3.9 void coco::memory_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *a* = NULL, std::list< certificate > * *b* = NULL) const [inline, virtual]

The evaluation operator of this computation hook. It stores the newly required memory of the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 56 of file memory_hook.h.

10.204.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

Friends

- class dag_delta
- class dag_undelta

10.205.1 Detailed Description

This class is used for the internal representation of optimization problems. It stores one optimization problem, which is passed to the various inference engines. The class is a subclass of `dag<expression_node>`, so the optimization problem is stored in form of a DAG of nodes of type expression_node. Models are internally represented by a hierarchy of classes: model_iddata, model_gid, model.

10.205.2 Member Typedef Documentation

10.205.2.1 typedef std::vector<walker>::const_iterator coco::coco::model::const_ref_iterator

This is a const iterator to the various vectors of walkers

Definition at line 70 of file search_graph.cc.

10.205.2.2 typedef dag<expression_node>::const_walker coco::coco::model::const_walker

Const walker (generalized const pointer) to the DAG.

Definition at line 65 of file search_graph.cc.

10.205.2.3 typedef std::vector<walker>::iterator coco::coco::model::ref_iterator

This is an iterator to the various vectors of walkers

Definition at line 68 of file search_graph.cc.

10.205.2.4 typedef dag<expression_node>::walker coco::coco::model::walker

Walker (generalized pointer) to the DAG.

Definition at line 63 of file search_graph.cc.

10.205.3 Constructor & Destructor Documentation

10.205.3.1 coco::model::model (model_gid * *__id* = `NULL`, bool *clone* = `false`) `[inline]`

This constructor generates a new model. If `__id` is non-NULL and `clone` is `true`, the new model has model_gid `__id`. Otherwise, new a model_gid structure is generated, either empty (`__id` is NULL) or a copy of `__id`.

Definition at line 718 of file model.hpp.

10.205.3.2 coco::model::model (model_gid * __id, const erased_part & _ep, bool clone = false)

This constructor generates a new model from the erased_part structure _ep (produced by some erase subgraph method). If __id is non-NULL and clone is true, the new model has model_gid __id. Otherwise, new a model_gid structure is generated, either empty (__id is NULL) or a copy of __id.

Definition at line 238 of file model.cc.

10.205.3.3 coco::model::model (int __num_of_vars) [inline]

This constructor generates a new model prepared for __num_of_vars variables.

Definition at line 711 of file model.hpp.

10.205.3.4 coco::model::model (const model & __m) [inline]

Standard Copy Constructor, which generates a new model_gid.

Definition at line 740 of file model.hpp.

10.205.3.5 coco::model::model (model_gid * __id, const model & __m) [inline]

Copy Constructor, which transfers the model __m to the model_gid __id.

Definition at line 756 of file model.hpp.

10.205.3.6 coco::model::model (std::istream & inp, bool do_simplify = true, vdbl::database * _db = NULL, vdbl::userid _uid = vdbl::userid(), std::vector< annotation > * _la = NULL, std::string mname = std::string(), bool continue_on_errors = false)

This constructor reads a model in .dag format from istream inp and builds the internal structure. The parameter do_simplify determines, whether the simplifier is invoked after reading. The parameters _db, _uid, and _la can be used to initialize the search database and the model annotations. The parameter mname can be used to initialize the model name. If continue_on_errors is true, the constructor does not throw an I/O exception.

Definition at line 554 of file model.cc.

10.205.3.7 coco::model::model (const char * name, bool do_simplify = true, vdbl::database * _db = NULL, vdbl::userid _uid = vdbl::userid(), std::vector< annotation > * _la = NULL, bool continue_on_errors = false)

This constructor reads a model in .dag format from file name and builds the internal structure. The parameter do_simplify determines, whether the simplifier is invoked after reading. The parameters _db, _uid, and _la can be used to initialize the search database and the model annotations. If continue_on_errors is true, the constructor does not throw an I/O exception.

Definition at line 564 of file model.cc.

10.205.3.8 coco::model::~model ( ) [inline]

Standard Destructor

Definition at line 772 of file model.hpp.

10.205.4 Member Function Documentation

10.205.4.1 void coco::model::arrange_constraints ( ) [inline]

A call to arrange_constraints sorts the constraints according to their complexity.

Definition at line 1810 of file model.hpp.

10.205.4.2 void coco::model::arrange_objectives ( ) [inline]

A call to arrange_objectives sorts the objectives according to their complexity.

Definition at line 1805 of file model.hpp.

10.205.4.3 bool coco::model::basic_simplify (bool *use_step2* = `true`)

This method calls the full model simplifier.

Definition at line 4466 of file model.cc.

10.205.4.4 model::walker coco::model::binary (const walker & *_op1*, const walker & *_op2*, int *expr_type*, double *_coeff1* = `1.0`, double *_coeff2* = `1.0`) [inline]

This method constructs a new binary operation with left operand `_op1`, multiplicative coefficient `_coeff1`, right operand `_op2`, multiplicative coefficient `_coeff2`, and expression type `expr_type`.

Definition at line 2150 of file model.hpp.

10.205.4.5 model::walker coco::model::binary (const walker & *_op1*, const walker & *_op2*, int *expr_type*, const basic_alltype & *_params*, double *_coeff1* = `1.0`, double *_coeff2* = `1.0`) [inline]

This method constructs a new binary operation with left operand `_op1`, multiplicative coefficient `_coeff1`, right operand `_op2`, multiplicative coefficient `_coeff2`, expression type `expr_type`, and additional expression parameters `_params`.

Definition at line 2170 of file model.hpp.

10.205.4.6 void coco::model::check_counters (bool *reset*) const

Check consistency of the number of parents and children of all nodes.

Definition at line 4816 of file model.cc.

10.205.4.7 void coco::model::clr_sky_ground_link ( ) [inline]

This method removes the edge from sky to ground in the DAG after all other nodes have been inserted.

Definition at line 2271 of file model.hpp.

10.205.4.8 void coco::model::compress_numbers ( ) [inline]

If this method is called, the nodes, variables, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

Definition at line 1826 of file model.hpp.

10.205.4.9 const std::string coco::model::const_name (unsigned int *n*) const [inline]

This method returns the name of the constraint n.

Definition at line 827 of file model.hpp.

10.205.4.10 model::walker coco::model::constant (double *_constant*) [inline]

This method constructs a new scalar constant with value _constant.

Definition at line 2058 of file model.hpp.

10.205.4.11 model::walker coco::model::constant (const std::vector< double > & *_constant*) [inline]

This method constructs a new vector constant with value _constant.

Definition at line 2069 of file model.hpp.

10.205.4.12 const model::walker & coco::model::constraint (unsigned int *i*) const [inline]

A call to this method returns a walker to constraint i.

Definition at line 873 of file model.hpp.

10.205.4.13 bool coco::model::d1_simplify (unsigned int *preporder*, const std::vector< interval > & *ranges*)

This method calls the 1D function simplifier.

Definition at line 538 of file model_d1simplify.cc.

10.205.4.14 void coco::model::detach_gid ( ) [inline]

A call to this method detaches the model from its model_gid. A new model_gid is generated within the same model_iddata.

Definition at line 709 of file model.hpp.

10.205.4.15 void coco::model::detect_0chain ( )

This method identifies all 0-chains (univariate functions) in the DAG.

Definition at line 4779 of file model.cc.

10.205.4.16 model::walker coco::model::empty_reference ( ) const [inline]

This method returns an empty node reference.

Definition at line 706 of file model.hpp.

10.205.4.17 std::pair< const std::string, double > coco::model::fixed_var (unsigned int *n*) const [inline]

This method returns the name and value of the fixed variable n.

Definition at line 834 of file model.hpp.

10.205.4.18 void coco::model::free_all ( ) [inline]

A call to this method removes all node, variable, and constraint references kept by this model.

Definition at line 1927 of file model.hpp.

10.205.4.19 void coco::model::free_const_num (const walker & _w, unsigned int _cnum) [inline]

This method removes the constraint _cnum from all model data structures.

Definition at line 2030 of file model.hpp.

10.205.4.20 void coco::model::free_node_num (unsigned int _nnum) [inline]

This method removes the node _nnum from all model data structures.

Definition at line 1993 of file model.hpp.

10.205.4.21 void coco::model::free_nodes_on_destroy ( ) [inline]

This method marks tells the model to call free_all during model destruction.

Definition at line 802 of file model.hpp.

10.205.4.22 void coco::model::free_obj_num (const walker & _w, unsigned int _cnum) [inline]

This method removes the objective _cnum from all model data structures.

Definition at line 2017 of file model.hpp.

10.205.4.23 void coco::model::free_var_num (int _vnum) [inline]

This method removes the variable _vnum from all model data structures.

Definition at line 2005 of file model.hpp.

10.205.4.24 bool coco::model::get_const_num (unsigned int *node_num*, unsigned int & *const_num*) const [inline]

The get_const_num method assigns to const_num the constraint number associated with the constraint, whose result node has node number node_num. The return value is true, if there is a constraint associated with node node_num.

Definition at line 798 of file model.hpp.

10.205.4.25 bool coco::model::get_linear_coeffs (const const_walker & *expr*, vmtl::sparse_vector< double > & *coeffs*, double & *constant*, const std::vector< interval > & *_ranges*) [inline]

A call to this method retrieves the coefficients (coeffs) and the constant (constant) of the linear function, whose result node is expr. It returns true, if the expression was indeed linear and false otherwise. The retrieval of the coefficients is to be performed in the feasible set determined by the node ranges _ranges.

Definition at line 3201 of file model.hpp.

10.205.4.26 bool coco::model::get_linear_coeffs (const const_walker & *expr,* vmtl::sparse_vector< double > & *coeffs,* double & *constant*) [inline]

A call to this method retrieves the coefficients (`coeffs`) and the constant (`constant`) of the linear function, whose result node is `expr`. It returns `true`, if the expression was indeed linear and `false` otherwise.

Definition at line 3212 of file model.hpp.

10.205.4.27 bool coco::model::get_obj_num (unsigned int *node_num,* unsigned int & *obj_num*) const [inline]

The get_obj_num method assigns to `obj_num` the objective number associated with the objective, whose result node has node number `node_num`. The return value is `true`, if there is an objective associated with node `node_num`.

Definition at line 794 of file model.hpp.

10.205.4.28 model::walker coco::model::ghost (unsigned int *_nnum*) [inline]

This method constructs a new ghost with node number `_nnum`.

Definition at line 2080 of file model.hpp.

10.205.4.29 ref_iterator coco::coco::model::ghost_begin ( ) [inline]

Get an iterator to the first ghost.

Definition at line 412 of file search_graph.cc.

10.205.4.30 const_ref_iterator coco::coco::model::ghost_begin ( ) const [inline]

Get a const iterator to the first ghost.

Definition at line 414 of file search_graph.cc.

10.205.4.31 ref_iterator coco::coco::model::ghost_end ( ) [inline]

Get an iterator beyond the last ghost.

Definition at line 416 of file search_graph.cc.

10.205.4.32 const_ref_iterator coco::coco::model::ghost_end ( ) const [inline]

Get a const iterator beyond the last ghost.

Definition at line 418 of file search_graph.cc.

10.205.4.33 model_gid* coco::coco::model::gid_data ( ) const [inline]

This method returns the model_gid structure this model belongs to.

Definition at line 212 of file search_graph.cc.

10.205.4.34 bool coco::model::is_empty (const walker & _w) const [inline]

Check whether this node is empty (unused).

Definition at line 705 of file model.hpp.

10.205.4.35 void coco::model::keep_nodes_on_destroy ( ) [inline]

This method marks tells the model not to call free_all during model destruction.

Definition at line 813 of file model.hpp.

10.205.4.36 bool coco::model::micro_simplify ( )

This method calls the micro simplifier which only initializes the most important data and semantics information.

Definition at line 3751 of file model.cc.

10.205.4.37 const std::string coco::model::model_name ( ) const [inline]

This method returns the name of the model.

Definition at line 824 of file model.hpp.

10.205.4.38 size_t coco::model::n_fixed_vars ( ) const [inline]

This method returns the number of variables fixed by the preprocessor.

Definition at line 833 of file model.hpp.

10.205.4.39 size_t coco::model::n_unused_constrs ( ) const [inline]

This method returns the number of unused constraints.

Definition at line 843 of file model.hpp.

10.205.4.40 size_t coco::model::n_unused_objs ( ) const [inline]

This method returns the number of unused objectives.

Definition at line 839 of file model.hpp.

10.205.4.41 size_t coco::model::n_unused_vars ( ) const [inline]

This method returns the number of unused variables.

Definition at line 836 of file model.hpp.

10.205.4.42 model::walker coco::model::nary (const std::vector< walker > & _op, int expr_type, const std::vector< double > & _coeffs = std::vector<double>()) [inline]

This method constructs a new n-ary operation with operand list _op, multiplicative coefficient list _coeffs, and expression type expr_type.

Definition at line 2212 of file model.hpp.

10.205.4.43 model::walker coco::model::nary (const std::vector< walker > & *_op,* int *expr_type,* const basic_alltype & *_params,* const std::vector< double > & *_coeffs =* std::vector<double>()) [inline]

This method constructs a new n-ary operation with operand list _op, multiplicative coefficient list _coeffs, expression type expr_type, and additional expression parameters _params.

Definition at line 2231 of file model.hpp.

10.205.4.44 void coco::model::new_variables (int *_new_num_of_vars*) [inline]

This method sets the number of variables in the model to _new_num_of_vars and communicates the change to all models below the same model_iddata.

Definition at line 2053 of file model.hpp.

10.205.4.45 int coco::model::next_constraint_num ( ) [inline]

This method returns the next free constraint number.

Definition at line 1818 of file model.hpp.

10.205.4.46 int coco::model::next_num ( ) [inline]

This method returns the next free node number.

Definition at line 1815 of file model.hpp.

10.205.4.47 int coco::model::next_objective_num ( ) [inline]

This method returns the next free objective number.

Definition at line 1817 of file model.hpp.

10.205.4.48 int coco::model::next_variable_num ( ) [inline]

This method returns the next free variable number.

Definition at line 1816 of file model.hpp.

10.205.4.49 const model::walker & coco::model::node (unsigned int *i*) const [inline]

A call to this method returns a walker to node i.

Definition at line 864 of file model.hpp.

10.205.4.50 unsigned int coco::model::number_of_constraints ( ) const [inline]

The number_of_constraints method returns the number of constraints across all models governed by the same model_iddata.

Definition at line 858 of file model.hpp.

10.205.4.51 unsigned int coco::coco::model::number_of_managed_constraints ( ) const [inline]

This method returns the number of constraints managed by this model class (the number of constraints in this DAG.

Definition at line 201 of file search_graph.cc.

10.205.4.52 unsigned int coco::coco::model::number_of_managed_nodes ( ) const [inline]

This method returns the number of nodes managed by this model class (the number of nodes in this DAG.

Definition at line 189 of file search_graph.cc.

10.205.4.53 unsigned int coco::coco::model::number_of_managed_objectives ( ) const [inline]

This method returns the number of objectives managed by this model class (the number of objectives in this DAG.

Definition at line 197 of file search_graph.cc.

10.205.4.54 unsigned int coco::coco::model::number_of_managed_variables ( ) const [inline]

This method returns the number of variables managed by this model class (the number of variables in this DAG.

Definition at line 193 of file search_graph.cc.

10.205.4.55 unsigned int coco::model::number_of_nodes ( ) const [inline]

The number_of_nodes method returns the number of nodes across all models governed by the same model_iddata.

Definition at line 861 of file model.hpp.

10.205.4.56 unsigned int coco::model::number_of_objectives ( ) const [inline]

The number_of_objectives method returns the number of objectives across all models governed by the same model_iddata.

Definition at line 855 of file model.hpp.

10.205.4.57 unsigned int coco::model::number_of_variables ( ) const [inline]

The number_of_variables method returns the number of variables across all models governed by the same model_iddata.

Definition at line 852 of file model.hpp.

10.205.4.58 double coco::model::obj_adj (unsigned int *n*) const [inline]

This method returns the additive constant in the objective function n.

Definition at line 831 of file model.hpp.

10.205.4.59 double coco::model::obj_mult (unsigned int *n*) const [inline]

This method returns the scalar multiplier of the objective function n.

Definition at line 832 of file model.hpp.

10.205.4.60 const std::string coco::model::obj_name (unsigned int *n*) const [inline]

This method returns the name of the objective function n.

Definition at line 829 of file model.hpp.

10.205.4.61 const model::walker & coco::model::objective (unsigned int *i*) const [inline]

A call to this method returns a walker to objective i.

Definition at line 870 of file model.hpp.

10.205.4.62 const std::map< int, std::vector< double > > & coco::model::optima ( ) const [inline]

This method returns the known optima defined. The return value is a map of known optima numbers to coordinate vectors.

Definition at line 849 of file model.hpp.

10.205.4.63 void coco::coco::model::prepare_kill ( ) [inline]

This method takes care that upon deletion everything goes away.

Definition at line 373 of file search_graph.cc.

10.205.4.64 void coco::model::remove_node (const walker & *_w,* unsigned int *_nnum*)

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

Definition at line 283 of file model.cc.

10.205.4.65 void coco::model::remove_node (const walker & *_w*) [inline]

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

Definition at line 2043 of file model.hpp.

10.205.4.66 void coco::model::remove_node (unsigned int *__node_num*) [inline]

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

Definition at line 2048 of file model.hpp.

10.205.4.67 void coco::coco::model::renumber_constraints ( )

If this method is called, the constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

10.205.4.68 void coco::model::renumber_variables ( ) [inline]

If this method is called, the variables are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

Definition at line 1820 of file model.hpp.

10.205.4.69 void coco::model::set_counters ( ) [inline]

This method initializes the `n_parents` and `n_children` members of all nodes.

See also

expression_node.

Definition at line 2277 of file model.hpp.

10.205.4.70 bool coco::model::simplify_thin ( ) [inline]

This simplifier replaces all thin nodes by corresponding constants and simplifies the DAG accordingly.

Bug The simplify_thin method does not yet work properly.

Definition at line 1800 of file model.hpp.

10.205.4.71 model::walker coco::model::store_constraint (const walker & _w) [inline]

This method stores a new constraint in all model data structures

Definition at line 1900 of file model.hpp.

10.205.4.72 model::walker coco::model::store_ghost (const walker & _w) [inline]

This method stores a new ghost in all model data structures

Definition at line 1912 of file model.hpp.

10.205.4.73 model::walker coco::model::store_node (const walker & _w) [inline]

This method stores a new node in all model data structures

Definition at line 1856 of file model.hpp.

10.205.4.74 model::walker coco::model::store_objective (const walker & _w) [inline]

This method stores a new objective in all model data structures

Definition at line 1888 of file model.hpp.

10.205.4.75 model::walker coco::model::store_variable (const walker & _w) [inline]

This method stores a new variable in all model data structures

Definition at line 1872 of file model.hpp.

10.205.4.76 const std::map< int, std::vector< double > > & coco::model::trace_points ( ) const [inline]

This method returns the trace points defined. The return value is a map of trace point numbers to coordinate vectors.

Definition at line 847 of file model.hpp.

10.205.4.77 model::walker coco::model::unary (const walker & *_op1,* int *expr_type,* double *_coeff =* 1.0) [inline]

This method constructs a new unary operation with operand _op1, multiplicative coefficient _coeff, and expression type expr_type.

Definition at line 2187 of file model.hpp.

10.205.4.78 model::walker coco::model::unary (const walker & *_op1,* int *expr_type,* const basic_alltype & *_params,* double *_coeff =* 1.0) [inline]

This method constructs a new unary operation with operand _op1, multiplicative coefficient _coeff, expression type expr_type, and additional expression parameters _params.

Definition at line 2201 of file model.hpp.

10.205.4.79 const std::string & coco::model::unused_constr (unsigned int *n*) const [inline]

This method returns the name of the unused constraint n.

Definition at line 845 of file model.hpp.

10.205.4.80 const std::string & coco::model::unused_obj (unsigned int *n*) const [inline]

This method returns the name of the unused objectives n.

Definition at line 841 of file model.hpp.

10.205.4.81 const std::string & coco::model::unused_var (unsigned int *n*) const [inline]

This method returns the name of the unused variable n.

Definition at line 837 of file model.hpp.

10.205.4.82 const model::walker & coco::model::var (unsigned int *i*) const [inline]

A call to this method returns a walker to variable i.

Definition at line 867 of file model.hpp.

10.205.4.83 const std::string coco::model::var_name (unsigned int *n*) const [inline]

This method returns the name of the variable n.

Definition at line 825 of file model.hpp.

10.205.4.84 model::walker coco::model::variable (unsigned int *_vnum*)

This method constructs a new variable with variable number _vnum.

Definition at line 4680 of file model.cc.

10.205.4.85 model::walker coco::model::vnary (int *expr_type, ...*)

This method constructs a new n-ary operation with expression type expr_type. The operands are specified as the additional parameters and need to be of type walker.

Definition at line 4724 of file model.cc.

10.205.4.86 model::walker coco::model::vxnary (const basic_alltype & *_params,* int *expr_type, ...*)

This method constructs a new n-ary operation with expression type expr_type and additional expression parameters _params. The operands and multiplicative constants are specified as the additional parameters and need to be of type walker followed by a double, and so on. The final double (in case it is 1.0) can be left out.

Definition at line 4749 of file model.cc.

10.205.4.87 void coco::model::write (std::ostream & *__o* = std::cout) const

This method writes the DAG in .dag format to the ostream __o.

Definition at line 4553 of file model.cc.

10.205.5.2 friend class dag_undelta [friend]

Definition at line 605 of file search_graph.cc.

10.205.6 Member Data Documentation

10.205.6.1 std::vector<walker> coco::coco::model::constraints

This is a vector of walkers pointing to the result nodes of the constraints.

Definition at line 114 of file search_graph.cc.

10.205.6.2 bool coco::coco::model::has_read_errors

This member is set to if an I/O exception was raised during model reading.

Definition at line 117 of file search_graph.cc.

10.205.6.3 vmtl::sparse_matrix<double> coco::coco::model::lin

The `lin` member is the matrix of linear constraints.

Definition at line 93 of file search_graph.cc.

10.205.6.4 std::vector<vmtl::sparse_matrix<double> > coco::coco::model::matd

The `matd` member is a vector of double matrices.

Definition at line 95 of file search_graph.cc.

10.205.6.5 std::vector<vmtl::sparse_matrix<interval> > coco::coco::model::mati

The `matd` member is a vector of interval matrices.

Definition at line 97 of file search_graph.cc.

10.205.6.6 std::vector<walker> coco::coco::model::objectives

This is a vector of walkers pointing to the result nodes of the objective functions.

Definition at line 111 of file search_graph.cc.

10.205.6.7 std::vector<int> coco::coco::model::ocoeff

These objective coefficients are used to transfer any constraint satisfaction problem or optimization problem to a vector valued minimization problem. The values are per objective

1	for a minimization problem
-1	for a maximization problem
0	for a constraint satisfaction problem

Definition at line 108 of file search_graph.cc.

The documentation for this class was generated from the following files:

10.206.1 Detailed Description

This class is used for the internal representation of optimization problems. It stores one optimization problem, which is passed to the various inference engines. The class is a subclass of `dag<expression_node>`, so the optimization problem is stored in form of a DAG of nodes of type expression_node. Models are internally represented by a hierarchy of classes: model_iddata, model_gid, model.

10.206.2 Member Typedef Documentation

10.206.2.1 typedef std::vector<walker>::const_iterator coco::model::const_ref_iterator

This is a const iterator to the various vectors of walkers

Definition at line 70 of file model.h.

10.206.2.2 typedef dag<expression_node>::const_walker coco::model::const_walker

Const walker (generalized const pointer) to the DAG.

Definition at line 65 of file model.h.

10.206.2.3 typedef std::vector<walker>::iterator coco::model::ref_iterator

This is an iterator to the various vectors of walkers

Definition at line 68 of file model.h.

10.206.2.4 typedef dag<expression_node>::walker coco::model::walker

Walker (generalized pointer) to the DAG.

Definition at line 63 of file model.h.

10.206.3 Constructor & Destructor Documentation

10.206.3.1 coco::model::model (model_gid * *__id* = `NULL`, bool *clone* = `false`)

This constructor generates a new model. If `__id` is non-NULL and `clone` is `true`, the new model has model_gid `__id`. Otherwise, new a model_gid structure is generated, either empty (`__id` is NULL) or a copy of `__id`.

10.206.3.2 coco::model::model (model_gid * *__id*, const erased_part & *_ep*, bool *clone* = `false`)

This constructor generates a new model from the erased_part structure `_ep` (produced by some erase subgraph method). If `__id` is non-NULL and `clone` is `true`, the new model has model_gid `__id`. Otherwise, new a model_gid structure is generated, either empty (`__id` is NULL) or a copy of `__id`.

10.206.3.3 coco::model::model (int *__num_of_vars*)

This constructor generates a new model prepared for ___num_of_vars variables.

10.206.3.4 coco::model::model (const model & *__m*)

Standard Copy Constructor, which generates a new model_gid.

10.206.3.5 coco::model::model (model_gid * *__id,* const model & *__m*)

Copy Constructor, which transfers the model ___m to the model_gid ___id.

10.206.3.6 coco::model::model (std::istream & *inp,* bool *do_simplify* = true, vdbl::database * *_db* = NULL, vdbl::userid *_uid* = vdbl::userid(), std::vector< annotation > * *_la* = NULL, std::string *mname* = std::string(), bool *continue_on_errors* = false)

This constructor reads a model in .dag format from istream inp and builds the internal structure. The parameter do_simplify determines, whether the simplifier is invoked after reading. The parameters _db, _uid, and _la can be used to initialize the search database and the model annotations. The parameter mname can be used to initialize the model name. If continue_on_errors is true, the constructor does not throw an I/O exception.

10.206.3.7 coco::model::model (const char * *name,* bool *do_simplify* = true, vdbl::database * *_db* = NULL, vdbl::userid *_uid* = vdbl::userid(), std::vector< annotation > * *_la* = NULL, bool *continue_on_errors* = false)

This constructor reads a model in .dag format from file name and builds the internal structure. The parameter do_simplify determines, whether the simplifier is invoked after reading. The parameters _db, _uid, and _la can be used to initialize the search database and the model annotations. If continue_on_errors is true, the constructor does not throw an I/O exception.

10.206.3.8 coco::model::~model ( )

Standard Destructor

10.206.4 Member Function Documentation

10.206.4.1 void coco::model::arrange_constraints ( )

A call to arrange_constraints sorts the constraints according to their complexity.

10.206.4.2 void coco::model::arrange_objectives ( )

A call to arrange_objectives sorts the objectives according to their complexity.

10.206.4.3 bool coco::model::basic_simplify (bool *use_step2* = true)

This method calls the full model simplifier.

10.206.4.4 walker coco::model::binary (const walker & *_op1,* const walker & *_op2,* int *expr_type,* double *_coeff1* = 1.0, double *_coeff2* = 1.0)

This method constructs a new binary operation with left operand _op1, multiplicative coefficient _coeff1, right operand _op2, multiplicative coefficient _coeff2, and expression type expr_type.

10.206.4.5 walker coco::model::binary (const walker & *_op1,* const walker & *_op2,* int *expr_type,* const basic_alltype & *_params,* double *_coeff1* = 1.0, double *_coeff2* = 1.0)

This method constructs a new binary operation with left operand _op1, multiplicative coefficient _coeff1, right operand _op2, multiplicative coefficient _coeff2, expression type expr_type, and additional expression parameters _params.

10.206.4.6 void coco::model::check_counters (bool *reset*) const

Check consistency of the number of parents and children of all nodes.

10.206.4.7 void coco::model::clr_sky_ground_link ( )

This method removes the edge from sky to ground in the DAG after all other nodes have been inserted.

10.206.4.8 void coco::model::compress_numbers ( )

If this method is called, the nodes, variables, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

10.206.4.9 const std::string coco::model::const_name (unsigned int *n*) const

This method returns the name of the constraint n.

10.206.4.10 walker coco::model::constant (double *_constant*)

This method constructs a new scalar constant with value _constant.

10.206.4.11 walker coco::model::constant (const std::vector< double > & *_constant*)

This method constructs a new vector constant with value _constant.

10.206.4.12 const walker& coco::model::constraint (unsigned int *i*) const

A call to this method returns a walker to constraint i.

10.206.4.13 bool coco::model::d1_simplify (unsigned int *preporder,* const std::vector< interval > & *ranges*)

This method calls the 1D function simplifier.

10.206.4.14 void coco::model::detach_gid ( )

A call to this method detaches the model from its model_gid. A new model_gid is generated within the same model_iddata.

10.206.4.15 void coco::model::detect_0chain ( )

This method identifies all 0-chains (univariate functions) in the DAG.

10.206.4.16 walker coco::model::empty_reference ( ) const

This method returns an empty node reference.

10.206.4.17 std::pair<const std::string, double> coco::model::fixed_var (unsigned int *n*) const

This method returns the name and value of the fixed variable `n`.

10.206.4.18 void coco::model::free_all ( )

A call to this method removes all node, variable, and constraint references kept by this model.

10.206.4.19 void coco::model::free_const_num (const walker & *_w,* unsigned int *_cnum*)

This method removes the constraint `_cnum` from all model data structures.

10.206.4.20 void coco::model::free_node_num (unsigned int *_nnum*)

This method removes the node `_nnum` from all model data structures.

10.206.4.21 void coco::model::free_nodes_on_destroy ( )

This method marks tells the model to call free_all during model destruction.

10.206.4.22 void coco::model::free_obj_num (const walker & *_w,* unsigned int *_cnum*)

This method removes the objective `_cnum` from all model data structures.

10.206.4.23 void coco::model::free_var_num (int *_vnum*)

This method removes the variable `_vnum` from all model data structures.

10.206.4.24 bool coco::model::get_const_num (unsigned int *node_num,* unsigned int & *const_num*) const

The get_const_num method assigns to `const_num` the constraint number associated with the constraint, whose result node has node number `node_num`. The return value is `true`, if there is a constraint associated with node `node_num`.

10.206.4.25 bool coco::model::get_linear_coeffs (const const_walker & *expr,* vmtl::sparse_vector< double > & *coeffs,* double & *constant,* const std::vector< interval > & *_ranges*)

A call to this method retrieves the coefficients (`coeffs`) and the constant (`constant`) of the linear function, whose result node is `expr`. It returns `true`, if the expression was indeed linear and `false` otherwise. The retrieval of the coefficients is to be performed in the feasible set determined by the node ranges `_ranges`.

10.206.4.26 bool coco::model::get_linear_coeffs (const const_walker & *expr,* vmtl::sparse_vector< double > & *coeffs,* double & *constant*)

A call to this method retrieves the coefficients (`coeffs`) and the constant (`constant`) of the linear function, whose result node is `expr`. It returns `true`, if the expression was indeed linear and `false` otherwise.

10.206.4.27 bool coco::model::get_obj_num (unsigned int *node_num,* unsigned int & *obj_num*) const

The get_obj_num method assigns to `obj_num` the objective number associated with the objective, whose result node has node number `node_num`. The return value is `true`, if there is an objective associated with node `node_num`.

10.206.4.28 walker coco::model::ghost (unsigned int *_nnum*)

This method constructs a new ghost with node number _nnum.

10.206.4.29 ref_iterator coco::model::ghost_begin ( ) [inline]

Get an iterator to the first ghost.

Definition at line 412 of file model.h.

10.206.4.30 const_ref_iterator coco::model::ghost_begin ( ) const [inline]

Get a const iterator to the first ghost.

Definition at line 414 of file model.h.

10.206.4.31 ref_iterator coco::model::ghost_end ( ) [inline]

Get an iterator beyond the last ghost.

Definition at line 416 of file model.h.

10.206.4.32 const_ref_iterator coco::model::ghost_end ( ) const [inline]

Get a const iterator beyond the last ghost.

Definition at line 418 of file model.h.

10.206.4.33 model_gid* coco::model::gid_data ( ) const [inline]

This method returns the model_gid structure this model belongs to.

Definition at line 212 of file model.h.

10.206.4.34 bool coco::model::is_empty (const walker & *_w*) const

Check whether this node is empty (unused).

10.206.4.35 void coco::model::keep_nodes_on_destroy ( )

This method marks tells the model not to call free_all during model destruction.

10.206.4.36 bool coco::model::micro_simplify ( )

This method calls the micro simplifier which only initializes the most important data and semantics information.

10.206.4.37 const std::string coco::model::model_name ( ) const

This method returns the name of the model.

10.206.4.38 size_t coco::model::n_fixed_vars ( ) const

This method returns the number of variables fixed by the preprocessor.

10.206.4.39 size_t coco::model::n_unused_constrs ( ) const

This method returns the number of unused constraints.

10.206.4.40 size_t coco::model::n_unused_objs ( ) const

This method returns the number of unused objectives.

10.206.4.41 size_t coco::model::n_unused_vars ( ) const

This method returns the number of unused variables.

10.206.4.42 walker coco::model::nary (const std::vector< walker > & *_op*, int *expr_type*, const std::vector< double > & *_coeffs* = `std::vector< double >()`)

This method constructs a new n-ary operation with operand list `_op`, multiplicative coefficient list `_coeffs`, and expression type `expr_type`.

10.206.4.43 walker coco::model::nary (const std::vector< walker > & *_op*, int *expr_type*, const basic_alltype & *_params*, const std::vector< double > & *_coeffs* = `std::vector< double >()`)

This method constructs a new n-ary operation with operand list `_op`, multiplicative coefficient list `_coeffs`, expression type `expr_type`, and additional expression parameters `_params`.

10.206.4.44 void coco::model::new_variables (int *_new_num_of_vars*)

This method sets the number of variables in the model to `_new_num_of_vars` and communicates the change to all models below the same model_iddata.

10.206.4.45 int coco::model::next_constraint_num ( )

This method returns the next free constraint number.

10.206.4.46 int coco::model::next_num ( )

This method returns the next free node number.

10.206.4.47 int coco::model::next_objective_num ( )

This method returns the next free objective number.

10.206.4.48 int coco::model::next_variable_num ( )

This method returns the next free variable number.

10.206.4.49 const walker& coco::model::node (unsigned int *i*) const

A call to this method returns a walker to node `i`.

10.206.4.50 unsigned int coco::model::number_of_constraints ( ) const

The number_of_constraints method returns the number of constraints across all models governed by the same model_iddata.

10.206.4.51 unsigned int coco::model::number_of_managed_constraints ( ) const [inline]

This method returns the number of constraints managed by this model class (the number of constraints in this DAG.

Definition at line 201 of file model.h.

10.206.4.52 unsigned int coco::model::number_of_managed_nodes ( ) const [inline]

This method returns the number of nodes managed by this model class (the number of nodes in this DAG.

Definition at line 189 of file model.h.

10.206.4.53 unsigned int coco::model::number_of_managed_objectives ( ) const [inline]

This method returns the number of objectives managed by this model class (the number of objectives in this DAG.

Definition at line 197 of file model.h.

10.206.4.54 unsigned int coco::model::number_of_managed_variables ( ) const [inline]

This method returns the number of variables managed by this model class (the number of variables in this DAG.

Definition at line 193 of file model.h.

10.206.4.55 unsigned int coco::model::number_of_nodes ( ) const

The number_of_nodes method returns the number of nodes across all models governed by the same model_iddata.

10.206.4.56 unsigned int coco::model::number_of_objectives ( ) const

The number_of_objectives method returns the number of objectives across all models governed by the same model_iddata.

10.206.4.57 unsigned int coco::model::number_of_variables ( ) const

The number_of_variables method returns the number of variables across all models governed by the same model_iddata.

10.206.4.58 double coco::model::obj_adj (unsigned int *n*) const

This method returns the additive constant in the objective function n.

10.206.4.59 double coco::model::obj_mult (unsigned int *n*) const

This method returns the scalar multiplier of the objective function n.

10.206.4.60 const std::string coco::model::obj_name (unsigned int *n*) const

This method returns the name of the objective function n.

10.206.4.61 const walker& coco::model::objective (unsigned int *i*) const

A call to this method returns a walker to objective i.

10.206.4.62 const std::map<int, std::vector<double> >& coco::model::optima ( ) const

This method returns the known optima defined. The return value is a map of known optima numbers to coordinate vectors.

10.206.4.63 void coco::model::prepare_kill ( ) [inline]

This method takes care that upon deletion everything goes away.

Definition at line 373 of file model.h.

10.206.4.64 void coco::model::remove_node (const walker & *_w*, unsigned int *_nnum*)

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

10.206.4.65 void coco::model::remove_node (const walker & *_w*)

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

10.206.4.66 void coco::model::remove_node (unsigned int *__node_num*)

The remove_node methods remove the node, specified by its walker _w, its node number _nnum, or by both.

10.206.4.67 void coco::model::renumber_constraints ( )

If this method is called, the constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

10.206.4.68 void coco::model::renumber_variables ( )

If this method is called, the variables are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

10.206.4.69 void coco::model::set_counters ( )

This method initializes the `n_parents` and `n_children` members of all nodes.

See also

expression_node.

10.206.4.70 bool coco::model::simplify_thin ( )

This simplifier replaces all thin nodes by corresponding constants and simplifies the DAG accordingly.

Bug The simplify_thin method does not yet work properly.

10.206.4.71 walker coco::model::store_constraint (const walker & *_w*)

This method stores a new constraint in all model data structures

10.206.4.72 walker coco::model::store_ghost (const walker & *_w*)

This method stores a new ghost in all model data structures

10.206.4.73 walker coco::model::store_node (const walker & *_w*)

This method stores a new node in all model data structures

10.206.4.74 walker coco::model::store_objective (const walker & *_w*)

This method stores a new objective in all model data structures

10.206.4.75 walker coco::model::store_variable (const walker & *_w*)

This method stores a new variable in all model data structures

10.206.4.76 const std::map<int, std::vector<double> >& coco::model::trace_points ( ) const

This method returns the trace points defined. The return value is a map of trace point numbers to coordinate vectors.

10.206.4.77 walker coco::model::unary (const walker & *_op1*, int *expr_type*, double *_coeff* = `1.0`)

This method constructs a new unary operation with operand `_op1`, multiplicative coefficient `_coeff`, and expression type `expr_type`.

10.206.4.78 walker coco::model::unary (const walker & *_op1,* int *expr_type,* const basic_alltype & *_params,* double *_coeff* = `1.0`)

This method constructs a new unary operation with operand `_op1`, multiplicative coefficient `_coeff`, expression type `expr_type`, and additional expression parameters `_params`.

10.206.4.79 const std::string& coco::model::unused_constr (unsigned int *n*) const

This method returns the name of the unused constraint `n`.

10.206.4.80 const std::string& coco::model::unused_obj (unsigned int *n*) const

This method returns the name of the unused objectives `n`.

10.206.4.81 const std::string& coco::model::unused_var (unsigned int *n*) const

This method returns the name of the unused variable `n`.

10.206.4.82 const walker& coco::model::var (unsigned int *i*) const

A call to this method returns a walker to variable `i`.

10.206.4.83 const std::string coco::model::var_name (unsigned int *n*) const

This method returns the name of the variable `n`.

10.206.4.84 walker coco::model::variable (unsigned int *_vnum*)

This method constructs a new variable with variable number `_vnum`.

10.206.4.85 walker coco::model::vnary (int *expr_type, ...*)

This method constructs a new n-ary operation with expression type `expr_type`. The operands are specified as the additional parameters and need to be of type `walker`.

10.206.4.86 walker coco::model::vxnary (const basic_alltype & *_params,* int *expr_type, ...*)

This method constructs a new n-ary operation with expression type `expr_type` and additional expression parameters `_params`. The operands and multiplicative constants are specified as the additional parameters and need to be of type `walker` followed by a double, and so on. The final double (in case it is 1.0) can be left out.

10.206.4.87 void coco::model::write (std::ostream & *__o* = `std::cout`) const

This method writes the DAG in .dag format to the ostream `__o`.

10.206.6 Member Data Documentation

10.206.6.1 std::vector<walker> coco::model::constraints

This is a vector of walkers pointing to the result nodes of the constraints.

Definition at line 114 of file model.h.

10.206.6.2 bool coco::model::has_read_errors

This member is set to if an I/O exception was raised during model reading.

Definition at line 117 of file model.h.

10.206.6.3 vmtl::sparse_matrix<double> coco::model::lin

The `lin` member is the matrix of linear constraints.

Definition at line 93 of file model.h.

10.206.6.4 std::vector<vmtl::sparse_matrix<double> > coco::model::matd

The `matd` member is a vector of double matrices.

Definition at line 95 of file model.h.

10.206.6.5 std::vector<vmtl::sparse_matrix<interval> > coco::model::mati

The `matd` member is a vector of interval matrices.

Definition at line 97 of file model.h.

10.206.6.6 std::vector<walker> coco::model::objectives

This is a vector of walkers pointing to the result nodes of the objective functions.

Definition at line 111 of file model.h.

10.206.6.7 std::vector<int> coco::model::ocoeff

These objective coefficients are used to transfer any constraint satisfaction problem or optimization problem to a vector valued minimization problem. The values are per objective

1	for a minimization problem
-1	for a maximization problem
0	for a constraint satisfaction problem

Definition at line 108 of file model.h.

- class model_iddata

10.207.1 Detailed Description

Models are grouped into sets, which can be directly combined with each other, like models and model deltas. In this class global references to nodes, variables, constants, and back references from constraint numbers to constraints are managed. Furthermore, the reference model, the main model to which all the deltas belong, is stored.

10.207.2 Constructor & Destructor Documentation

10.207.2.1 coco::model_gid::model_gid (model & __m, model_iddata * __i = NULL)

Constructor, which also builds a new model_iddata structure, unless __i is non-NULL. The parameter __m sets the reference model.

10.207.2.2 coco::model_gid::model_gid (model & __m, unsigned int n, model_iddata * __i = NULL)

Constructor, which also builds a new model_iddata structure, unless __i is non-NULL. The parameter __m sets the reference model, while n presets the number of variables.

10.207.2.3 coco::model_gid::model_gid (model & __mr, const model_gid & __m)

Copy Constructor, which copies the model_gid __m but changes the reference model to __mr.

10.207.2.4 coco::model_gid::~model_gid ( ) [inline]

Standard Destructor

Definition at line 969 of file model.h.

10.207.3 Member Function Documentation

10.207.3.1 void coco::model_gid::add_optimum (int nr, const std::vector< double > & d) [inline]

A call to this method adds the known optimum nr with coordinates d to the list of known optima.

Definition at line 1216 of file model.h.

10.207.3.2 void coco::model_gid::add_trace_point (int nr, const std::vector< double > & d) [inline]

A call to this method adds the trace point nr with coordinates d to the list of trace points.

Definition at line 1212 of file model.h.

10.207.3.3 void coco::model_gid::compress_numbers (bool renumber_vars = false, bool renumber_obj = false, bool renumber_const = false) [inline]

If this method is called, the nodes, variables, objectives, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed. The parameters renumber_vars, renumber_obj, and renumber_const determine whether the variable and constraint numbers, respectively, are renumbered in addition to the node numbers.

Definition at line 1056 of file model.h.

10.207.3.4 const std::string coco::model_gid::const_name (unsigned int *n*) const [inline]

This method returns the name of the constraint n.

Definition at line 1136 of file model.h.

10.207.3.5 void coco::model_gid::const_name (unsigned int *n,* const std::string & *vn*) [inline]

A call to this method sets the name of the constraint n to cn.

Definition at line 1139 of file model.h.

10.207.3.6 void coco::model_gid::const_name (unsigned int *n,* const char * *vn*) [inline]

A call to this method sets the name of the constraint n to cn.

Definition at line 1142 of file model.h.

10.207.3.7 const model::walker& coco::model_gid::constraint (unsigned int *i*) const [inline]

A call to this method returns a walker to constraint i.

Definition at line 1068 of file model.h.

10.207.3.8 bool coco::model_gid::empty (const model::walker & *__x*) const [inline]

This method checks whether the walker ___x points to an empty reference, i.e. to a deleted node.

Definition at line 1073 of file model.h.

10.207.3.9 model::walker coco::model_gid::empty_reference ( ) const [inline]

This method returns an empty reference. This is, e.g., stored in global reference arrays whenever a node is deleted.

Definition at line 1080 of file model.h.

10.207.3.10 std::pair<const std::string, double> coco::model_gid::fixed_var (unsigned int *n*) const [inline]

This method returns the name and value of the fixed variable n.

Definition at line 1166 of file model.h.

10.207.3.11 void coco::model_gid::fixed_var (const std::string & *vn,* double *val*) [inline]

This method stores the fixed variable with name vn and value val.

Definition at line 1169 of file model.h.

10.207.3.12 void coco::model_gid::fixed_var (const char * *vn,* double *val*) [inline]

This method stores the fixed variable with name vn and value val.

Definition at line 1171 of file model.h.

10.207.3.13 unsigned int coco::model_gid::get_const_id ( ) [inline]

This method returns a free constraint number and removes it from the list of free constraint numbers.

Definition at line 1044 of file model.h.

10.207.3.14 bool coco::model_gid::get_const_num (unsigned int *node_num,* unsigned int & *const_num*)

The get_const_num method assigns to `const_num` the constraint number associated with the constraint, whose result node has node number `node_num`. The return value is `true`, if there is a constraint associated with node `node_num`.

10.207.3.15 unsigned int coco::model_gid::get_node_id ( ) [inline]

This method returns a free node number a removes it from the list of free node numbers.

Definition at line 1026 of file model.h.

10.207.3.16 unsigned int coco::model_gid::get_obj_id ( ) [inline]

This method returns a free objective number and removes it from the list of free objective numbers.

Definition at line 1038 of file model.h.

10.207.3.17 bool coco::model_gid::get_obj_num (unsigned int *node_num,* unsigned int & *obj_num*)

The get_obj_num method assigns to `obj_num` the objective number associated with the objective, whose result node has node number `node_num`. The return value is `true`, if there is a objective associated with node `node_num`.

10.207.3.18 unsigned int coco::model_gid::get_var_id ( ) [inline]

This method returns a free variable number a removes it from the list of free variable numbers.

Definition at line 1032 of file model.h.

10.207.3.19 bool coco::model_gid::have_gconst_ref (unsigned int *_cnum*) const [inline]

This method checks whether a global constraint reference exists for constraint number `_cnum`.

Definition at line 1096 of file model.h.

10.207.3.20 bool coco::model_gid::have_glob_ref (unsigned int *_nnum*) const [inline]

This method checks whether a global node reference exists for node number `_nnum`.

Definition at line 1084 of file model.h.

10.207.3.21 bool coco::model_gid::have_gobj_ref (unsigned int *_onum*) const [inline]

This method checks whether a global objective reference exists for objective number `_onum`.

Definition at line 1092 of file model.h.

10.207.3.22 bool coco::model_gid::have_gvar_ref (unsigned int _*vnum*) const [inline]

This method checks whether a global variable reference exists for variable number _nnum.

Definition at line 1088 of file model.h.

10.207.3.23 bool coco::model_gid::its_me (const model & __*m*) const [inline]

The its_me method tests if the model __m is the reference model for this model group.

Definition at line 1077 of file model.h.

10.207.3.24 void coco::model_gid::make_const_back_ref (unsigned int *node*, unsigned int *cnum*)

This method constructs a constraint back reference from node number node to constraint number cnum.

10.207.3.25 void coco::model_gid::make_obj_back_ref (unsigned int *node*, unsigned int *onum*)

This method constructs a objective back reference from node number node to objective number cnum.

10.207.3.26 void coco::model_gid::mk_gconstref (unsigned int *n*, const model::walker & __*w*)

This method constructs a global constraint reference to __w with number n.

10.207.3.27 void coco::model_gid::mk_globref (unsigned int *n*, const model::walker & __*w*)

This method constructs a global node reference to __w with number n.

10.207.3.28 void coco::model_gid::mk_gobjref (unsigned int *n*, const model::walker & __*w*)

This method constructs a global objective reference to __w with number n.

10.207.3.29 void coco::model_gid::mk_gvarref (unsigned int *n*, const model::walker & __*w*)

This method constructs a global variable reference to __w with number n.

10.207.3.30 const std::string coco::model_gid::model_name ( ) const [inline]

This method returns the name of the model.

Definition at line 1106 of file model.h.

10.207.3.31 void coco::model_gid::model_name (const std::string & *n*) [inline]

This method sets the name of the model to n.

Definition at line 1108 of file model.h.

10.207.3.32 void coco::model_gid::model_name (const char * *n*) [inline]

This method sets the name of the model to n.

Definition at line 1110 of file model.h.

10.207.3.33 size_t coco::model_gid::n_fixed_vars ( ) const [inline]

This method returns the number of variables fixed by the presolve.

Definition at line 1164 of file model.h.

10.207.3.34 size_t coco::model_gid::n_unused_constrs ( ) const [inline]

This method returns the number of unused constraints.

Definition at line 1195 of file model.h.

10.207.3.35 size_t coco::model_gid::n_unused_objs ( ) const [inline]

This method returns the number of unused objectives.

Definition at line 1185 of file model.h.

10.207.3.36 size_t coco::model_gid::n_unused_vars ( ) const [inline]

This method returns the number of unused variables.

Definition at line 1175 of file model.h.

10.207.3.37 const model::walker& coco::model_gid::node (unsigned int *i*) const [inline]

A call to this method returns a walker to node `i`.

Definition at line 1061 of file model.h.

10.207.3.38 unsigned int coco::model_gid::number_of_constraints ( ) const [inline]

The number_of_constraints method returns the number of constraints across all models governed by the same model_iddata.

Definition at line 989 of file model.h.

10.207.3.39 void coco::model_gid::number_of_constraints (unsigned int *_n*) [inline]

This method sets the number of constraints across all model groups in the same model_iddata.

Definition at line 1002 of file model.h.

10.207.3.40 unsigned int coco::model_gid::number_of_nodes ( ) const [inline]

The number_of_nodes method returns the number of nodes across all models governed by the same model_iddata.

Definition at line 978 of file model.h.

10.207.3.41 void coco::model_gid::number_of_nodes (unsigned int *_n*) [inline]

This method sets the number of nodes across all model groups in the same model_iddata.

Definition at line 993 of file model.h.

10.207.3.42 unsigned int coco::model_gid::number_of_objectives ( ) const [inline]

The number_of_objectives method returns the number of objectives across all models governed by the same model_iddata.

Definition at line 985 of file model.h.

10.207.3.43 void coco::model_gid::number_of_objectives (unsigned int _n) [inline]

This method sets the number of objectives across all model groups in the same model_iddata.

Definition at line 999 of file model.h.

10.207.3.44 unsigned int coco::model_gid::number_of_variables ( ) const [inline]

The number_of_variables method returns the number of variables across all models governed by the same model_iddata.

Definition at line 981 of file model.h.

10.207.3.45 void coco::model_gid::number_of_variables (unsigned int _n) [inline]

This method sets the number of variables across all model groups in the same model_iddata.

Definition at line 996 of file model.h.

10.207.3.46 double coco::model_gid::obj_adj (unsigned int n) const [inline]

This method returns the additive constant in the objective function n.

Definition at line 1152 of file model.h.

10.207.3.47 void coco::model_gid::obj_adj (unsigned int n, double adj) [inline]

With this method the additive constant in the objective function n is set to adj.

Definition at line 1155 of file model.h.

10.207.3.48 double coco::model_gid::obj_mult (unsigned int n) const [inline]

This method returns the scalar multiplier of the objective function n.

Definition at line 1158 of file model.h.

10.207.3.49 void coco::model_gid::obj_mult (unsigned int n, double mult) [inline]

With this method the scalar multiplier of the objective function n is set to mult.

Definition at line 1161 of file model.h.

10.207.3.50 const std::string coco::model_gid::obj_name (unsigned int n) const [inline]

This method returns the name of the objective n.

Definition at line 1121 of file model.h.

10.207.3.51 void coco::model_gid::obj_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the objective n to cn.

Definition at line 1124 of file model.h.

10.207.3.52 void coco::model_gid::obj_name (unsigned int *n*, const char * *vn*) [inline]

A call to this method sets the name of the objective n to cn.

Definition at line 1127 of file model.h.

10.207.3.53 const model::walker& coco::model_gid::objective (unsigned int *i*) const [inline]

A call to this method returns a walker to objective i.

Definition at line 1065 of file model.h.

10.207.3.54 const std::map<int, std::vector<double> >& coco::model_gid::optima ( ) const

This method returns the known optima defined. The return value is a map of known optima numbers to coordinate vectors.

10.207.3.55 void coco::model_gid::remove_const_id (unsigned int *n*) [inline]

This method inserts the constraint number n in the list of free constraint numbers.

Definition at line 1047 of file model.h.

10.207.3.56 void coco::model_gid::remove_const_ref (unsigned int *_n*)

This method removes the global constraint reference of node _n.

10.207.3.57 void coco::model_gid::remove_node_id (unsigned int *n*) [inline]

This method inserts the node number n in the list of free node numbers.

Definition at line 1029 of file model.h.

10.207.3.58 void coco::model_gid::remove_node_ref (unsigned int *_n*) [inline]

This method removes the global node reference of node _n.

Definition at line 940 of file model.h.

10.207.3.59 void coco::model_gid::remove_obj_id (unsigned int *n*) [inline]

This method inserts the objective number n in the list of free objective numbers.

Definition at line 1041 of file model.h.

10.207.3.60 void coco::model_gid::remove_obj_ref (unsigned int *_n*)

This method removes the global objective reference of node _n.

10.207.3.61 void coco::model_gid::remove_var_id (unsigned int *n*) [inline]

This method inserts the variable number n in the list of free variable numbers.

Definition at line 1035 of file model.h.

10.207.3.62 void coco::model_gid::remove_var_ref (unsigned int *_n*) [inline]

This method removes the global variable reference of node _n.

Definition at line 944 of file model.h.

10.207.3.63 void coco::model_gid::set_glob_ref (const std::vector< model::walker > & *node_ref*)

This method initializes the glob_ref array and the maximal node number.

10.207.3.64 void coco::model_gid::set_gvar_ref (const std::vector< model::walker > & *var_ref*)

This method initializes the glob_ref array and the maximal node number.

10.207.3.65 const std::map<int, std::vector<double> >& coco::model_gid::trace_points ( ) const

This method returns the trace points defined. The return value is a map of trace point numbers to coordinate vectors.

10.207.3.66 const std::string& coco::model_gid::unused_constr (unsigned int *n*) const [inline]

This method returns the name of the unused constraint n.

Definition at line 1197 of file model.h.

10.207.3.67 void coco::model_gid::unused_constr (const std::string & *vn*) [inline]

This method stores the unused constraint with name vn.

Definition at line 1200 of file model.h.

10.207.3.68 void coco::model_gid::unused_constr (const char * *vn*) [inline]

This method stores the unused constraint with name vn.

Definition at line 1202 of file model.h.

10.207.3.69 const std::string& coco::model_gid::unused_obj (unsigned int *n*) const [inline]

This method returns the name of the unused objective n.

Definition at line 1187 of file model.h.

10.207.3.70 void coco::model_gid::unused_obj (const std::string & *vn*) [inline]

This method stores the unused objective with name vn.

Definition at line 1190 of file model.h.

10.207.3.71 void coco::model_gid::unused_obj (const char * *vn*) [inline]

This method stores the unused objective with name vn.

Definition at line 1192 of file model.h.

10.207.3.72 const std::string& coco::model_gid::unused_var (unsigned int *n*) const [inline]

This method returns the name of the unused variable n.

Definition at line 1177 of file model.h.

10.207.3.73 void coco::model_gid::unused_var (const std::string & *vn*) [inline]

This method stores the unused variable with name vn.

Definition at line 1180 of file model.h.

10.207.3.74 void coco::model_gid::unused_var (const char * *vn*) [inline]

This method stores the unused variable with name vn.

Definition at line 1182 of file model.h.

10.207.3.75 const std::string coco::model_gid::var_name (unsigned int *n*) const [inline]

This method returns the name of the variable n.

Definition at line 1113 of file model.h.

10.207.3.76 void coco::model_gid::var_name (unsigned int *n,* const std::string & *vn*) [inline]

A call to this method sets the name of the variable n to vn.

Definition at line 1115 of file model.h.

10.207.3.77 void coco::model_gid::var_name (unsigned int *n,* const char * *vn*) [inline]

A call to this method sets the name of the variable n to vn.

Definition at line 1117 of file model.h.

10.207.3.78 const model::walker& coco::model_gid::variable (unsigned int *i*) const [inline]

A call to this method returns a walker to variable i.

Definition at line 1063 of file model.h.

- class model_iddata

10.208.1 Detailed Description

Models are grouped into sets, which can be directly combined with each other, like models and model deltas. In this class global references to nodes, variables, constants, and back references from constraint numbers to constraints are managed. Furthermore, the reference model, the main model to which all the deltas belong, is stored.

10.208.2 Constructor & Destructor Documentation

10.208.2.1 coco::model_gid::model_gid (model & __m, model_iddata * __i = NULL) [inline]

Constructor, which also builds a new model_iddata structure, unless __i is non-NULL. The parameter __m sets the reference model.

Definition at line 394 of file model.hpp.

10.208.2.2 coco::model_gid::model_gid (model & __m, unsigned int n, model_iddata * __i = NULL) [inline]

Constructor, which also builds a new model_iddata structure, unless __i is non-NULL. The parameter __m sets the reference model, while n presets the number of variables.

Definition at line 405 of file model.hpp.

10.208.2.3 coco::model_gid::model_gid (model & __mr, const model_gid & __m) [inline]

Copy Constructor, which copies the model_gid __m but changes the reference model to __mr.

Definition at line 416 of file model.hpp.

10.208.2.4 coco::coco::model_gid::~model_gid ( ) [inline]

Standard Destructor

Definition at line 969 of file search_graph.cc.

10.208.3 Member Function Documentation

10.208.3.1 void coco::coco::model_gid::add_optimum (int nr, const std::vector< double > & d) [inline]

A call to this method adds the known optimum nr with coordinates d to the list of known optima.

Definition at line 1216 of file search_graph.cc.

10.208.3.2 void coco::coco::model_gid::add_trace_point (int nr, const std::vector< double > & d) [inline]

A call to this method adds the trace point nr with coordinates d to the list of trace points.

Definition at line 1212 of file search_graph.cc.

10.208.3.3 void coco::coco::model_gid::compress_numbers (bool *renumber_vars* = false, bool *renumber_obj* = false, bool *renumber_const* = false) [inline]

If this method is called, the nodes, variables, objectives, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed. The parameters renumber_vars, renumber_obj, and renumber_const determine whether the variable and constraint numbers, respectively, are renumbered in addition to the node numbers.

Definition at line 1056 of file search_graph.cc.

10.208.3.4 const std::string coco::coco::model_gid::const_name (unsigned int *n*) const [inline]

This method returns the name of the constraint n.

Definition at line 1136 of file search_graph.cc.

10.208.3.5 void coco::coco::model_gid::const_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the constraint n to cn.

Definition at line 1139 of file search_graph.cc.

10.208.3.6 void coco::coco::model_gid::const_name (unsigned int *n*, const char * *vn*) [inline]

A call to this method sets the name of the constraint n to cn.

Definition at line 1142 of file search_graph.cc.

10.208.3.7 const model::walker& coco::coco::model_gid::constraint (unsigned int *i*) const [inline]

A call to this method returns a walker to constraint i.

Definition at line 1068 of file search_graph.cc.

10.208.3.8 bool coco::coco::model_gid::empty (const model::walker & *__x*) const [inline]

This method checks whether the walker ___x points to an empty reference, i.e. to a deleted node.

Definition at line 1073 of file search_graph.cc.

10.208.3.9 model::walker coco::coco::model_gid::empty_reference ( ) const [inline]

This method returns an empty reference. This is, e.g., stored in global reference arrays whenever a node is deleted.

Definition at line 1080 of file search_graph.cc.

10.208.3.10 std::pair<const std::string, double> coco::coco::model_gid::fixed_var (unsigned int *n*) const [inline]

This method returns the name and value of the fixed variable n.

Definition at line 1166 of file search_graph.cc.

10.208.3.11 void coco::coco::model_gid::fixed_var (const std::string & *vn,* double *val*) [inline]

This method stores the fixed variable with name vn and value val.

Definition at line 1169 of file search_graph.cc.

10.208.3.12 void coco::coco::model_gid::fixed_var (const char * *vn,* double *val*) [inline]

This method stores the fixed variable with name vn and value val.

Definition at line 1171 of file search_graph.cc.

10.208.3.13 unsigned int coco::coco::model_gid::get_const_id ( ) [inline]

This method returns a free constraint number and removes it from the list of free constraint numbers.

Definition at line 1044 of file search_graph.cc.

10.208.3.14 bool coco::model_gid::get_const_num (unsigned int *node_num,* unsigned int & *const_num*) [inline]

The get_const_num method assigns to const_num the constraint number associated with the constraint, whose result node has node number node_num. The return value is true, if there is a constraint associated with node node_num.

Definition at line 665 of file model.hpp.

10.208.3.15 unsigned int coco::coco::model_gid::get_node_id ( ) [inline]

This method returns a free node number a removes it from the list of free node numbers.

Definition at line 1026 of file search_graph.cc.

10.208.3.16 unsigned int coco::coco::model_gid::get_obj_id ( ) [inline]

This method returns a free objective number and removes it from the list of free objective numbers.

Definition at line 1038 of file search_graph.cc.

10.208.3.17 bool coco::model_gid::get_obj_num (unsigned int *node_num,* unsigned int & *obj_num*) [inline]

The get_obj_num method assigns to obj_num the objective number associated with the objective, whose result node has node number node_num. The return value is true, if there is a objective associated with node node_num.

Definition at line 623 of file model.hpp.

10.208.3.18 unsigned int coco::coco::model_gid::get_var_id ( ) [inline]

This method returns a free variable number a removes it from the list of free variable numbers.

Definition at line 1032 of file search_graph.cc.

10.208.3.19 bool coco::coco::model_gid::have_gconst_ref (unsigned int *_cnum*) const [inline]

This method checks whether a global constraint reference exists for constraint number _cnum.

Definition at line 1096 of file search_graph.cc.

10.208.3.20 bool coco::coco::model_gid::have_glob_ref (unsigned int *_nnum*) const [inline]

This method checks whether a global node reference exists for node number _nnum.

Definition at line 1084 of file search_graph.cc.

10.208.3.21 bool coco::coco::model_gid::have_gobj_ref (unsigned int *_onum*) const [inline]

This method checks whether a global objective reference exists for objective number _onum.

Definition at line 1092 of file search_graph.cc.

10.208.3.22 bool coco::coco::model_gid::have_gvar_ref (unsigned int *_vnum*) const [inline]

This method checks whether a global variable reference exists for variable number _nnum.

Definition at line 1088 of file search_graph.cc.

10.208.3.23 bool coco::coco::model_gid::its_me (const model & *__m*) const [inline]

The its_me method tests if the model ___m is the reference model for this model group.

Definition at line 1077 of file search_graph.cc.

10.208.3.24 void coco::model_gid::make_const_back_ref (unsigned int *node,* unsigned int *cnum*) [inline]

This method constructs a constraint back reference from node number node to constraint number cnum.

Definition at line 676 of file model.hpp.

10.208.3.25 void coco::model_gid::make_obj_back_ref (unsigned int *node,* unsigned int *onum*) [inline]

This method constructs a objective back reference from node number node to objective number cnum.

Definition at line 634 of file model.hpp.

10.208.3.26 void coco::model_gid::mk_gconstref (unsigned int *n,* const model::walker & *__w*) [inline]

This method constructs a global constraint reference to ___w with number n.

Definition at line 583 of file model.hpp.

10.208.3.27 void coco::model_gid::mk_globref (unsigned int *n,* const model::walker & *__w*) [inline]

This method constructs a global node reference to ___w with number n.

Definition at line 539 of file model.hpp.

10.208.3.28 void coco::model_gid::mk_gobjref (unsigned int *n*, const model::walker & *__w*) [inline]

This method constructs a global objective reference to ___w with number n.

Definition at line 565 of file model.hpp.

10.208.3.29 void coco::model_gid::mk_gvarref (unsigned int *n*, const model::walker & *__w*) [inline]

This method constructs a global variable reference to ___w with number n.

Definition at line 552 of file model.hpp.

10.208.3.30 const std::string coco::coco::model_gid::model_name ( ) const [inline]

This method returns the name of the model.

Definition at line 1106 of file search_graph.cc.

10.208.3.31 void coco::coco::model_gid::model_name (const std::string & *n*) [inline]

This method sets the name of the model to n.

Definition at line 1108 of file search_graph.cc.

10.208.3.32 void coco::coco::model_gid::model_name (const char * *n*) [inline]

This method sets the name of the model to n.

Definition at line 1110 of file search_graph.cc.

10.208.3.33 size_t coco::coco::model_gid::n_fixed_vars ( ) const [inline]

This method returns the number of variables fixed by the presolve.

Definition at line 1164 of file search_graph.cc.

10.208.3.34 size_t coco::coco::model_gid::n_unused_constrs ( ) const [inline]

This method returns the number of unused constraints.

Definition at line 1195 of file search_graph.cc.

10.208.3.35 size_t coco::coco::model_gid::n_unused_objs ( ) const [inline]

This method returns the number of unused objectives.

Definition at line 1185 of file search_graph.cc.

10.208.3.36 size_t coco::coco::model_gid::n_unused_vars ( ) const [inline]

This method returns the number of unused variables.

Definition at line 1175 of file search_graph.cc.

10.208.3.37 const model::walker& coco::coco::model_gid::node (unsigned int *i*) const [inline]

A call to this method returns a walker to node `i`.

Definition at line 1061 of file search_graph.cc.

10.208.3.38 unsigned int coco::coco::model_gid::number_of_constraints ( ) const [inline]

The number_of_constraints method returns the number of constraints across all models governed by the same model_iddata.

Definition at line 989 of file search_graph.cc.

10.208.3.39 void coco::coco::model_gid::number_of_constraints (unsigned int *_n*) [inline]

This method sets the number of constraints across all model groups in the same model_iddata.

Definition at line 1002 of file search_graph.cc.

10.208.3.40 unsigned int coco::coco::model_gid::number_of_nodes ( ) const [inline]

The number_of_nodes method returns the number of nodes across all models governed by the same model_iddata.

Definition at line 978 of file search_graph.cc.

10.208.3.41 void coco::coco::model_gid::number_of_nodes (unsigned int *_n*) [inline]

This method sets the number of nodes across all model groups in the same model_iddata.

Definition at line 993 of file search_graph.cc.

10.208.3.42 unsigned int coco::coco::model_gid::number_of_objectives ( ) const [inline]

The number_of_objectives method returns the number of objectives across all models governed by the same model_iddata.

Definition at line 985 of file search_graph.cc.

10.208.3.43 void coco::coco::model_gid::number_of_objectives (unsigned int *_n*) [inline]

This method sets the number of objectives across all model groups in the same model_iddata.

Definition at line 999 of file search_graph.cc.

10.208.3.44 unsigned int coco::coco::model_gid::number_of_variables ( ) const [inline]

The number_of_variables method returns the number of variables across all models governed by the same model_iddata.

Definition at line 981 of file search_graph.cc.

10.208.3.45 void coco::coco::model_gid::number_of_variables (unsigned int *_n*) [inline]

This method sets the number of variables across all model groups in the same model_iddata.

Definition at line 996 of file search_graph.cc.

10.208.3.46 double coco::coco::model_gid::obj_adj (unsigned int *n*) const [inline]

This method returns the additive constant in the objective function n.

Definition at line 1152 of file search_graph.cc.

10.208.3.47 void coco::coco::model_gid::obj_adj (unsigned int *n*, double *adj*) [inline]

With this method the additive constant in the objective function n is set to adj.

Definition at line 1155 of file search_graph.cc.

10.208.3.48 double coco::coco::model_gid::obj_mult (unsigned int *n*) const [inline]

This method returns the scalar multiplier of the objective function n.

Definition at line 1158 of file search_graph.cc.

10.208.3.49 void coco::coco::model_gid::obj_mult (unsigned int *n*, double *mult*) [inline]

With this method the scalar multiplier of the objective function n is set to mult.

Definition at line 1161 of file search_graph.cc.

10.208.3.50 const std::string coco::coco::model_gid::obj_name (unsigned int *n*) const [inline]

This method returns the name of the objective n.

Definition at line 1121 of file search_graph.cc.

10.208.3.51 void coco::coco::model_gid::obj_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the objective n to cn.

Definition at line 1124 of file search_graph.cc.

10.208.3.52 void coco::coco::model_gid::obj_name (unsigned int *n*, const char * *vn*) [inline]

A call to this method sets the name of the objective n to cn.

Definition at line 1127 of file search_graph.cc.

10.208.3.53 const model::walker& coco::coco::model_gid::objective (unsigned int *i*) const [inline]

A call to this method returns a walker to objective i.

Definition at line 1065 of file search_graph.cc.

10.208.3.54 const std::map< int, std::vector< double > > & coco::model_gid::optima ( ) const [inline]

This method returns the known optima defined. The return value is a map of known optima numbers to coordinate vectors.

Definition at line 702 of file model.hpp.

10.208.3.55 void coco::coco::model_gid::remove_const_id (unsigned int *n*) [inline]

This method inserts the constraint number n in the list of free constraint numbers.

Definition at line 1047 of file search_graph.cc.

10.208.3.56 void coco::model_gid::remove_const_ref (unsigned int *_n*) [inline]

This method removes the global constraint reference of node _n.

Definition at line 643 of file model.hpp.

10.208.3.57 void coco::coco::model_gid::remove_node_id (unsigned int *n*) [inline]

This method inserts the node number n in the list of free node numbers.

Definition at line 1029 of file search_graph.cc.

10.208.3.58 void coco::coco::model_gid::remove_node_ref (unsigned int *_n*) [inline]

This method removes the global node reference of node _n.

Definition at line 940 of file search_graph.cc.

10.208.3.59 void coco::coco::model_gid::remove_obj_id (unsigned int *n*) [inline]

This method inserts the objective number n in the list of free objective numbers.

Definition at line 1041 of file search_graph.cc.

10.208.3.60 void coco::model_gid::remove_obj_ref (unsigned int *_n*) [inline]

This method removes the global objective reference of node _n.

Definition at line 601 of file model.hpp.

10.208.3.61 void coco::coco::model_gid::remove_var_id (unsigned int *n*) [inline]

This method inserts the variable number n in the list of free variable numbers.

Definition at line 1035 of file search_graph.cc.

10.208.3.62 void coco::coco::model_gid::remove_var_ref (unsigned int *_n*) [inline]

This method removes the global variable reference of node _n.

Definition at line 944 of file search_graph.cc.

10.208.3.63 void coco::coco::model_gid::set_glob_ref (const std::vector< model::walker > & *node_ref*) [inline]

This method initializes the glob_ref array and the maximal node number.

Definition at line 686 of file model.hpp.

10.208.3.64 void coco::coco::model_gid::set_gvar_ref (const std::vector< model::walker > & *var_ref*) [inline]

This method initializes the glob_ref array and the maximal node number.

Definition at line 693 of file model.hpp.

10.208.3.65 const std::map< int, std::vector< double > > & coco::model_gid::trace_points ( ) const [inline]

This method returns the trace points defined. The return value is a map of trace point numbers to coordinate vectors.

Definition at line 699 of file model.hpp.

10.208.3.66 const std::string& coco::coco::model_gid::unused_constr (unsigned int *n*) const [inline]

This method returns the name of the unused constraint n.

Definition at line 1197 of file search_graph.cc.

10.208.3.67 void coco::coco::model_gid::unused_constr (const std::string & *vn*) [inline]

This method stores the unused constraint with name vn.

Definition at line 1200 of file search_graph.cc.

10.208.3.68 void coco::coco::model_gid::unused_constr (const char * *vn*) [inline]

This method stores the unused constraint with name vn.

Definition at line 1202 of file search_graph.cc.

10.208.3.69 const std::string& coco::coco::model_gid::unused_obj (unsigned int *n*) const [inline]

This method returns the name of the unused objective n.

Definition at line 1187 of file search_graph.cc.

10.208.3.70 void coco::coco::model_gid::unused_obj (const std::string & *vn*) [inline]

This method stores the unused objective with name vn.

Definition at line 1190 of file search_graph.cc.

10.208.3.71 void coco::coco::model_gid::unused_obj (const char * *vn*) [inline]

This method stores the unused objective with name vn.

Definition at line 1192 of file search_graph.cc.

10.208.3.72 const std::string& coco::coco::model_gid::unused_var (unsigned int *n*) const [inline]

This method returns the name of the unused variable n.

Definition at line 1177 of file search_graph.cc.

10.208.3.73 void coco::coco::model_gid::unused_var (const std::string & *vn*) [inline]

This method stores the unused variable with name vn.

Definition at line 1180 of file search_graph.cc.

10.208.3.74 void coco::coco::model_gid::unused_var (const char * *vn*) [inline]

This method stores the unused variable with name vn.

Definition at line 1182 of file search_graph.cc.

10.208.3.75 const std::string coco::coco::model_gid::var_name (unsigned int *n*) const [inline]

This method returns the name of the variable n.

Definition at line 1113 of file search_graph.cc.

10.208.3.76 void coco::coco::model_gid::var_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the variable n to vn.

Definition at line 1115 of file search_graph.cc.

10.208.3.77 void coco::coco::model_gid::var_name (unsigned int *n*, const char * *vn*) [inline]

A call to this method sets the name of the variable n to vn.

Definition at line 1117 of file search_graph.cc.

10.208.3.78 const model::walker& coco::coco::model_gid::variable (unsigned int *i*) const [inline]

A call to this method returns a walker to variable i.

Definition at line 1063 of file search_graph.cc.

10.208.4 Friends And Related Function Documentation

10.208.4.1 friend class model_iddata [friend]

Definition at line 1220 of file search_graph.cc.

The documentation for this class was generated from the following files:

- model.h
- model.cc
- model.hpp

10.209 coco::coco::model_iddata Class Reference

The model id-data class (the topmost in the model class hierarchy)

Public Member Functions

- model_iddata (unsigned int n=0)
- ~model_iddata ()
- void new_ref (model_gid &__m)
- bool delete_ref (model_gid &__m)
- void compress_numbers (bool renum_vars, bool renum_objs=false, bool renum_consts=false)

Methods for handling the global model data

These methods can be used for handling important information of a model about nodes, variables, constraints,...

- unsigned int number_of_nodes () const
- unsigned int number_of_variables () const
- unsigned int number_of_objectives () const
- unsigned int number_of_constraints () const
- void number_of_nodes (unsigned int _n)
- void number_of_variables (unsigned int _n)
- void number_of_objectives (unsigned int _n)
- void number_of_constraints (unsigned int _n)
- unsigned int get_node_id ()
- void remove_node_id (unsigned int n)
- unsigned int get_var_id ()
- void remove_var_id (unsigned int n)
- unsigned int get_obj_id ()
- void remove_obj_id (unsigned int n)
- unsigned int get_const_id ()
- void remove_const_id (unsigned int n)

Methods for handling modeling information

These methods return names of variables and constants and other data which is irrelevant for the solution process but necessary for user interaction.

- const std::string model_name () const
- void model_name (const std::string &n)
- const std::string var_name (unsigned int n) const

- const std::string & unused_constr (unsigned int n) const
- void unused_constr (const std::string &vn)

Friends

- class model_gid

10.209.1 Detailed Description

Âă The model_iddata class is the topmost in a hierarchy of model classes. It represents the important global information, manages the free and used numbers for nodes, variables, and constraints. There is usually no need to directly access members or methods of this class. The class is managed automatically by the various methods of the model_gid and model classes. All model groups (model_gid) in one model_iddata have the same variable, node, and constraint numbering, and share the same global information (free and used numbers, names, ...).

10.209.2 Constructor & Destructor Documentation

10.209.2.1 coco::coco::model_iddata::model_iddata (unsigned int *n* = `0`) [inline]

Standard Constructor, which prepares for `n` variables.

Definition at line 690 of file search_graph.cc.

10.209.2.2 coco::coco::model_iddata::~model_iddata ( ) [inline]

Standard Destructor

Definition at line 703 of file search_graph.cc.

10.209.3 Member Function Documentation

10.209.3.1 void coco::model_iddata::compress_numbers (bool *renum_vars*, bool *renum_objs* = `false`, bool *renum_consts* = `false`)

If this method is called, the nodes, variables, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

Definition at line 81 of file model.cc.

10.209.3.2 const std::string coco::model_iddata::const_name (unsigned int *n*) const [inline]

This method returns the name of the constraint `n`.

Definition at line 304 of file model.hpp.

10.209.3.3 void coco::model_iddata::const_name (unsigned int *n*, const std::string & *cn*) [inline]

A call to this method sets the name of the constraint `n` to `cn`.

Definition at line 316 of file model.hpp.

10.209.3.4 bool coco::model_iddata::delete_ref (model_gid & *__m*) [inline]

This method deletes the back reference to the model_gid ___m.

Definition at line 52 of file model.hpp.

10.209.3.5 std::pair< const std::string, double > coco::model_iddata::fixed_var (unsigned int *n*) const [inline]

This method returns the name and value of the fixed variable n.

Definition at line 337 of file model.hpp.

10.209.3.6 void coco::model_iddata::fixed_var (const std::string & *vn*, double *val*) [inline]

This method stores the fixed variable with name vn and value val.

Definition at line 347 of file model.hpp.

10.209.3.7 unsigned int coco::model_iddata::get_const_id ( ) [inline]

This method returns a free constraint number a removes it from the list of free constraint numbers.

Definition at line 170 of file model.hpp.

10.209.3.8 unsigned int coco::model_iddata::get_node_id ( ) [inline]

This method returns a free node number a removes it from the list of free node numbers.

Definition at line 66 of file model.hpp.

10.209.3.9 unsigned int coco::model_iddata::get_obj_id ( ) [inline]

This method returns a free objective number a removes it from the list of free objective numbers.

Definition at line 134 of file model.hpp.

10.209.3.10 unsigned int coco::model_iddata::get_var_id ( ) [inline]

This method returns a free variable number a removes it from the list of free variable numbers.

Definition at line 99 of file model.hpp.

10.209.3.11 const std::string coco::model_iddata::model_name ( ) const [inline]

This method returns the name of the model.

Definition at line 243 of file model.hpp.

10.209.3.12 void coco::model_iddata::model_name (const std::string & *n*) [inline]

This method sets the name of the model to n.

Definition at line 251 of file model.hpp.

10.209.3.13 size_t coco::coco::model_iddata::n_fixed_vars ( ) const [inline]

This method returns the number of variables fixed by the preprocessor.

Definition at line 813 of file search_graph.cc.

10.209.3.14 size_t coco::coco::model_iddata::n_unused_constrs ( ) const [inline]

This method returns the number of unused constraints.

Definition at line 834 of file search_graph.cc.

10.209.3.15 size_t coco::coco::model_iddata::n_unused_objs ( ) const [inline]

This method returns the number of unused objectives.

Definition at line 827 of file search_graph.cc.

10.209.3.16 size_t coco::coco::model_iddata::n_unused_vars ( ) const [inline]

This method returns the number of unused variables.

Definition at line 820 of file search_graph.cc.

10.209.3.17 void coco::coco::model_iddata::new_ref (model_gid & __m) [inline]

This method adds a new back reference to the model_gid ___m.

Definition at line 706 of file search_graph.cc.

10.209.3.18 unsigned int coco::coco::model_iddata::number_of_constraints ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free constraints. This is the allocated size of the constraint access vectors.

Definition at line 730 of file search_graph.cc.

10.209.3.19 void coco::model_iddata::number_of_constraints (unsigned int _n) [inline]

This method sets the number of constraints to _n.

Definition at line 234 of file model.hpp.

10.209.3.20 unsigned int coco::coco::model_iddata::number_of_nodes ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free nodes. This is the allocated size of the node access vectors.

Definition at line 718 of file search_graph.cc.

10.209.3.21 void coco::model_iddata::number_of_nodes (unsigned int _n) [inline]

This method sets the number of nodes to _n.

Definition at line 206 of file model.hpp.

10.209.3.22 unsigned int coco::coco::model_iddata::number_of_objectives ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free objectives. This is the allocated size of the objective access vectors.

Definition at line 726 of file search_graph.cc.

10.209.3.23 void coco::model_iddata::number_of_objectives (unsigned int _n) [inline]

This method sets the number of objectives to _n.

Definition at line 223 of file model.hpp.

10.209.3.24 unsigned int coco::coco::model_iddata::number_of_variables ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free variables. This is the allocated size of the variable access vectors.

Definition at line 722 of file search_graph.cc.

10.209.3.25 void coco::model_iddata::number_of_variables (unsigned int _n) [inline]

This method sets the number of variables to _n.

Definition at line 214 of file model.hpp.

10.209.3.26 double coco::model_iddata::obj_adj (unsigned int n) const [inline]

This method returns the additive constant in the objective function n.

Definition at line 328 of file model.hpp.

10.209.3.27 void coco::model_iddata::obj_adj (unsigned int n, double adj) [inline]

With this method the additive constant in the objective function n is set to adj.

Definition at line 330 of file model.hpp.

10.209.3.28 double coco::model_iddata::obj_mult (unsigned int n) const [inline]

This method returns the scalar multiplier of the objective function n.

Definition at line 332 of file model.hpp.

10.209.3.29 void coco::model_iddata::obj_mult (unsigned int n, double mult) [inline]

With this method the scalar multiplier of the objective function n is set to mult.

Definition at line 334 of file model.hpp.

10.209.3.30 const std::string coco::model_iddata::obj_name (unsigned int n) const [inline]

This method returns the name of the objective function.

Definition at line 280 of file model.hpp.

10.209.3.31 void coco::model_iddata::obj_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the objective function n to vn.

Definition at line 292 of file model.hpp.

10.209.3.32 void coco::model_iddata::remove_const_id (unsigned int *n*) [inline]

This method inserts the constraint number n in the list of free constraint numbers.

Definition at line 183 of file model.hpp.

10.209.3.33 void coco::model_iddata::remove_node_id (unsigned int *n*) [inline]

This method inserts the node number n in the list of free node numbers.

Definition at line 79 of file model.hpp.

10.209.3.34 void coco::model_iddata::remove_obj_id (unsigned int *n*) [inline]

This method inserts the objective number n in the list of free objective numbers.

Definition at line 147 of file model.hpp.

10.209.3.35 void coco::model_iddata::remove_var_id (unsigned int *n*) [inline]

This method inserts the variable number n in the list of free variable numbers.

Definition at line 112 of file model.hpp.

10.209.3.36 const std::string & coco::model_iddata::unused_constr (unsigned int *n*) const [inline]

This method returns the name of the unused constraint n.

Definition at line 380 of file model.hpp.

10.209.3.37 void coco::model_iddata::unused_constr (const std::string & *vn*) [inline]

This method stores the unused constraint with name vn.

Definition at line 389 of file model.hpp.

10.209.3.38 const std::string & coco::model_iddata::unused_obj (unsigned int *n*) const [inline]

This method returns the name of the unused objective n.

Definition at line 366 of file model.hpp.

10.209.3.39 void coco::model_iddata::unused_obj (const std::string & *vn*) [inline]

This method stores the unused objective with name vn.

Definition at line 375 of file model.hpp.

10.209.3.40 const std::string & coco::model_iddata::unused_var (unsigned int *n*) const [inline]

This method returns the name of the unused variable n.

Definition at line 352 of file model.hpp.

10.209.3.41 void coco::model_iddata::unused_var (const std::string & *vn*) [inline]

This method stores the unused variable with name vn.

Definition at line 361 of file model.hpp.

10.209.3.42 const std::string coco::model_iddata::var_name (unsigned int *n*) const [inline]

This method returns the name of the variable n.

Definition at line 256 of file model.hpp.

10.209.3.43 void coco::model_iddata::var_name (unsigned int *n*, const std::string & *vn*) [inline]

A call to this method sets the name of the variable n to vn.

Definition at line 268 of file model.hpp.

10.209.4 Friends And Related Function Documentation

10.209.4.1 friend class model_gid [friend]

Definition at line 841 of file search_graph.cc.

The documentation for this class was generated from the following files:

- model.h
- model.cc
- model.hpp

10.210 coco::model_iddata Class Reference

The model id-data class (the topmost in the model class hierarchy)

```
#include <model.h>
```

Public Member Functions

- model_iddata (unsigned int n=0)
- ~model_iddata ()
- void new_ref (model_gid &__m)
- bool delete_ref (model_gid &__m)
- void compress_numbers (bool renum_vars, bool renum_objs=false, bool renum_consts=false)

Methods for handling the global model data

These methods can be used for handling important information of a model about nodes, variables, constraints,...

- unsigned int number_of_nodes () const
- unsigned int number_of_variables () const
- unsigned int number_of_objectives () const
- unsigned int number_of_constraints () const

Friends

- class model_gid

10.210.1 Detailed Description

Âă The model_iddata class is the topmost in a hierarchy of model classes. It represents the important global information, manages the free and used numbers for nodes, variables, and constraints. There is usually no need to directly access members or methods of this class. The class is managed automatically by the various methods of the model_gid and model classes. All model groups (model_gid) in one model_iddata have the same variable, node, and constraint numbering, and share the same global information (free and used numbers, names, ...).

10.210.2 Constructor & Destructor Documentation

10.210.2.1 coco::model_iddata::model_iddata (unsigned int *n* = `0`) `[inline]`

Standard Constructor, which prepares for `n` variables.

Definition at line 690 of file model.h.

10.210.2.2 coco::model_iddata::~model_iddata ( ) `[inline]`

Standard Destructor

Definition at line 703 of file model.h.

10.210.3 Member Function Documentation

10.210.3.1 void coco::model_iddata::compress_numbers (bool *renum_vars,* bool *renum_objs* = `false`, bool *renum_consts* = `false`)

If this method is called, the nodes, variables, and constraints are renumbered to fill gaps (unused numbers). To keep the model hierarchy consistent, all numbers in all models in the same model_iddata are changed.

10.210.3.2 const std::string coco::model_iddata::const_name (unsigned int *n*) const

This method returns the name of the constraint `n`.

10.210.3.3 void coco::model_iddata::const_name (unsigned int *n,* const std::string & *cn*)

A call to this method sets the name of the constraint `n` to `cn`.

10.210.3.4 bool coco::model_iddata::delete_ref (model_gid & *__m*)

This method deletes the back reference to the model_gid `__m`.

10.210.3.5 std::pair<const std::string, double> coco::model_iddata::fixed_var (unsigned int *n*) const

This method returns the name and value of the fixed variable `n`.

10.210.3.6 void coco::model_iddata::fixed_var (const std::string & *vn,* double *val*)

This method stores the fixed variable with name `vn` and value `val`.

10.210.3.7 unsigned int coco::model_iddata::get_const_id ( )

This method returns a free constraint number a removes it from the list of free constraint numbers.

10.210.3.8 unsigned int coco::model_iddata::get_node_id ( )

This method returns a free node number a removes it from the list of free node numbers.

10.210.3.9 unsigned int coco::model_iddata::get_obj_id ( )

This method returns a free objective number a removes it from the list of free objective numbers.

10.210.3.10 unsigned int coco::model_iddata::get_var_id ( )

This method returns a free variable number a removes it from the list of free variable numbers.

10.210.3.11 const std::string coco::model_iddata::model_name ( ) const

This method returns the name of the model.

10.210.3.12 void coco::model_iddata::model_name (const std::string & *n*)

This method sets the name of the model to `n`.

10.210.3.13 size_t coco::model_iddata::n_fixed_vars ( ) const [inline]

This method returns the number of variables fixed by the preprocessor.

Definition at line 813 of file model.h.

10.210.3.14 size_t coco::model_iddata::n_unused_constrs ( ) const [inline]

This method returns the number of unused constraints.

Definition at line 834 of file model.h.

10.210.3.15 size_t coco::model_iddata::n_unused_objs ( ) const [inline]

This method returns the number of unused objectives.

Definition at line 827 of file model.h.

10.210.3.16 size_t coco::model_iddata::n_unused_vars ( ) const [inline]

This method returns the number of unused variables.

Definition at line 820 of file model.h.

10.210.3.17 void coco::model_iddata::new_ref (model_gid & *__m*) [inline]

This method adds a new back reference to the model_gid `__m`.

Definition at line 706 of file model.h.

10.210.3.18 unsigned int coco::model_iddata::number_of_constraints ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free constraints. This is the allocated size of the constraint access vectors.

Definition at line 730 of file model.h.

10.210.3.19 void coco::model_iddata::number_of_constraints (unsigned int _n)

This method sets the number of constraints to _n.

10.210.3.20 unsigned int coco::model_iddata::number_of_nodes ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free nodes. This is the allocated size of the node access vectors.

Definition at line 718 of file model.h.

10.210.3.21 void coco::model_iddata::number_of_nodes (unsigned int _n)

This method sets the number of nodes to _n.

10.210.3.22 unsigned int coco::model_iddata::number_of_objectives ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free objectives. This is the allocated size of the objective access vectors.

Definition at line 726 of file model.h.

10.210.3.23 void coco::model_iddata::number_of_objectives (unsigned int _n)

This method sets the number of objectives to _n.

10.210.3.24 unsigned int coco::model_iddata::number_of_variables ( ) const [inline]

A call to this method retrieves the start of the contiguous part of the free variables. This is the allocated size of the variable access vectors.

Definition at line 722 of file model.h.

10.210.3.25 void coco::model_iddata::number_of_variables (unsigned int _n)

This method sets the number of variables to _n.

10.210.3.26 double coco::model_iddata::obj_adj (unsigned int n) const

This method returns the additive constant in the objective function n.

10.210.3.27 void coco::model_iddata::obj_adj (unsigned int n, double adj)

With this method the additive constant in the objective function n is set to adj.

10.210.3.28 double coco::model_iddata::obj_mult (unsigned int n) const

This method returns the scalar multiplier of the objective function n.

10.210.3.29 void coco::model_iddata::obj_mult (unsigned int *n*, double *mult*)

With this method the scalar multiplier of the objective function `n` is set to `mult`.

10.210.3.30 const std::string coco::model_iddata::obj_name (unsigned int *n*) const

This method returns the name of the objective function.

10.210.3.31 void coco::model_iddata::obj_name (unsigned int *n*, const std::string & *vn*)

A call to this method sets the name of the objective function `n` to `vn`.

10.210.3.32 void coco::model_iddata::remove_const_id (unsigned int *n*)

This method inserts the constraint number `n` in the list of free constraint numbers.

10.210.3.33 void coco::model_iddata::remove_node_id (unsigned int *n*)

This method inserts the node number `n` in the list of free node numbers.

10.210.3.34 void coco::model_iddata::remove_obj_id (unsigned int *n*)

This method inserts the objective number `n` in the list of free objective numbers.

10.210.3.35 void coco::model_iddata::remove_var_id (unsigned int *n*)

This method inserts the variable number `n` in the list of free variable numbers.

10.210.3.36 const std::string& coco::model_iddata::unused_constr (unsigned int *n*) const

This method returns the name of the unused constraint `n`.

10.210.3.37 void coco::model_iddata::unused_constr (const std::string & *vn*)

This method stores the unused constraint with name `vn`.

10.210.3.38 const std::string& coco::model_iddata::unused_obj (unsigned int *n*) const

This method returns the name of the unused objective `n`.

10.210.3.39 void coco::model_iddata::unused_obj (const std::string & *vn*)

This method stores the unused objective with name `vn`.

10.210.3.40 const std::string& coco::model_iddata::unused_var (unsigned int *n*) const

This method returns the name of the unused variable `n`.

10.210.3.41 void coco::model_iddata::unused_var (const std::string & *vn*)

This method stores the unused variable with name `vn`.

10.210.3.42 const std::string coco::model_iddata::var_name (unsigned int *n*) const

This method returns the name of the variable n.

10.210.3.43 void coco::model_iddata::var_name (unsigned int *n*, const std::string & *vn*)

A call to this method sets the name of the variable n to vn.

10.214.3 Member Function Documentation

10.214.3.1 void coco::no_certificate::destroy_copy (certificate_base * __c) const [inline]

Clone Destructor

Definition at line 109 of file api_cert.h.

10.214.3.2 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.214.3.3 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.214.3.4 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.214.3.5 virtual std::string coco::coco::certificate_base::get_contents ( ) const [inline, virtual, inherited]

Retrieve the contents information (the certificate type) for this certificate.

Reimplemented in coco::rigorous_module_certificate, and coco::split_certificate.

Definition at line 165 of file search_graph.cc.

10.214.3.6 certificate coco::coco::certificate_base::make_certificate (const std::string & c) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.214.3.7 certificate coco::coco::certificate_base::make_certificate (const std::string & c) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.214.3.8 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.214.3.9 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.214.3.10 no_certificate* coco::no_certificate::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::certificate_base.

Definition at line 101 of file api_cert.h.

10.214.3.11 bool coco::no_certificate::operator!= (const certificate_base & *_c*) const [inline]

Definition at line 120 of file api_cert.h.

10.214.3.12 bool coco::no_certificate::operator!= (const no_certificate & *_c*) const [inline]

Definition at line 126 of file api_cert.h.

10.214.3.13 bool coco::no_certificate::operator== (const certificate_base & *_c*) const [inline]

Comparison operators

Definition at line 117 of file api_cert.h.

10.214.3.14 bool coco::no_certificate::operator== (const no_certificate & *_c*) const [inline]

Comparison operators

Definition at line 125 of file api_cert.h.

10.214.3.15 bool coco::no_certificate::verify (const work_node & *_x*) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. In this class: `false`.

Reimplemented from coco::coco::certificate_base.

Definition at line 114 of file api_cert.h.

10.214.4 Member Data Documentation

10.214.4.1 std::string coco::coco::certificate_base::_contents [protected, inherited]

The contents (descriptive string, type) of this certificate

Definition at line 128 of file search_graph.cc.

- search_node_relation parent_relation (const work_node &wn) const
- search_node_id node_id (const work_node &wn) const

10.224.1 Detailed Description

This class is a work node computation hook (

See also

work_node_comp_hook), which calculates lower and upper bounds on the objective function on the work node and keeps them in the columns “obj lowbound” and “obj upbound”. The diameter of the interval is kept in the column “obj diameter”

10.224.2 Constructor & Destructor Documentation

10.224.2.1 coco::objbounds_comp_hook::objbounds_comp_hook (bool *_ub* = false, bool *_cd* = false) [inline]

Standard Constructor

Definition at line 54 of file objbounds_hook.h.

10.224.2.2 virtual coco::objbounds_comp_hook::~objbounds_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 60 of file objbounds_hook.h.

10.224.3 Member Function Documentation

10.224.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in ___managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.224.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 238 of file comp_hook.h.

10.224.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 135 of file comp_hook.h.

10.224.3.4 bool coco::objbounds_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the columns “obj lowbound” “obj diameter”, and “obj upbound” in the “search info” table.

Reimplemented from coco::wnc_hook_base.

Definition at line 130 of file objbounds_hook.h.

10.224.3.5 bool coco::objbounds_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the columns “obj lowbound” “obj diameter”, and “obj upbound” in the “search info” table.

Reimplemented from coco::wnc_hook_base.

Definition at line 120 of file objbounds_hook.h.

10.224.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.224.3.7 objbounds_comp_hook* coco::objbounds_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 63 of file objbounds_hook.h.

10.224.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.224.3.9 void coco::objbounds_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *add_ds* = `NULL`, std::list< certificate > * *add_cs* = `NULL`) const [inline, virtual]

The evaluation operator of this computation hook. It stores the lower and upper bounds on the objective function on the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 69 of file objbounds_hook.h.

10.224.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following file:

- objbounds_hook.h

10.225 coco::one_over_x_func Class Reference

10.225.1 Member Typedef Documentation

10.225.1.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info [inherited]

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.225.1.2 typedef std::vector<point_info> coco::d1func::point_list [inherited]

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.225.2 Member Enumeration Documentation

10.225.2.1 enum coco::d1func::d1func_point_t [inherited]

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point-: At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup

d1fp_oddpoledn

d1fp_jumpldef

d1fp_jumpludef

d1fp_point
d1fp_undefined
d1fp_wild
d1fp_jumprdef
d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.225.2.2 enum coco::d1func::d1solve_t [inherited]

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0
d1solve_1
d1solve_2

Definition at line 106 of file d1func.h.

10.225.3 Constructor & Destructor Documentation

10.225.3.1 coco::one_over_x_func::one_over_x_func ( ) [inline]

Definition at line 107 of file d1testf.h.

10.225.4 Member Function Documentation

10.225.4.1 virtual uint64_t coco::d1func::chash ( ) [pure virtual, inherited]

the const hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.225.4.2 convex_info coco::d1func::convexity (const interval & *i*, unsigned int *k*) const [virtual, inherited]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.225.4.3 virtual std::string coco::d1func::dag_out ( ) const [inline, virtual, inherited]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 205 of file d1func.h.

10.225.4.4 virtual int coco::d1func::degree_update (int *in_degree*) const [inline, virtual, inherited]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.225.4.5 int coco::d1func::differentiability (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return differentiability information on `i`.

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 2351 of file d1func.cc.

10.225.4.6 virtual double coco::d1func::eval (double *x*, unsigned int *k*) const [pure virtual, inherited]

the point evaluation

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.225.4.7 diffNumber coco::d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual, inherited]

the diffNumber evaluation

Reimplemented in coco::dag_d1func.

Definition at line 349 of file d1func.cc.

10.225.4.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.225.4.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 390 of file d1func.cc.

10.225.4.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual, inherited]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.225.4.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.225.4.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual, inherited]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.225.4.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 794 of file d1func.cc.

10.225.4.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval first order slope evaluation at center z

Definition at line 1403 of file d1func.cc.

10.225.4.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at centers z and y

Definition at line 1984 of file d1func.cc.

10.225.4.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.225.4.17 virtual std::pair<double,double> coco::d1func::evald (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 437 of file d1func.h.

10.225.4.18 virtual void coco::d1func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual, inherited]

the point, first to third derivative evaluation

Reimplemented in coco::xexp_func.

Definition at line 443 of file d1func.h.

10.225.4.19 virtual std::triple<double,double,double> coco::d1func::evalt (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and first and second derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 440 of file d1func.h.

10.225.4.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual, inherited]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.225.4.21 virtual const char* coco::d1func::func_name ( ) const [pure virtual, inherited]

the name of the d1func.

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.225.4.22 virtual interval coco::d1func::imperfect_eval (const interval & *x*, unsigned int *k*) const [pure virtual, inherited]

the imperfect evaluation of k th derivative.

Implemented in coco::xexp_func, coco::hsf_func, and coco::dag_d1func.

10.225.4.23 virtual interval coco::one_over_x_func::imperfect_eval_f0 (const interval & *x*) const [inline, protected, virtual]

the imperfect function evaluation

Definition at line 91 of file d1testf.h.

10.225.4.24 virtual interval coco::one_over_x_func::imperfect_eval_f1 (const interval & *x*) const [inline, protected, virtual]

the imperfect first derivative evaluation

Definition at line 96 of file d1testf.h.

10.225.4.25 virtual interval coco::one_over_x_func::imperfect_eval_f2 (const interval & *x*) const [inline, protected, virtual]

the imperfect second derivative evaluation

Definition at line 101 of file d1testf.h.

10.225.4.26 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual, inherited]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.225.4.27 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1708 of file d1func.cc.

10.225.4.28 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1778 of file d1func.cc.

10.225.4.29 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.225.4.30 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual, inherited]

the other comparison operator

Definition at line 476 of file d1func.h.

10.225.4.31 virtual bool coco::d1func::operator== (const d1func & *b*) const [inline, virtual, inherited]

the comparison operator

Reimplemented in coco::hsf_func, coco::xexp_func, and coco::dag_d1func.

Definition at line 473 of file d1func.h.

10.225.4.32 virtual bool coco::d1func::order_is_supported (unsigned int *k*) const [inline, virtual, inherited]

check whether evaluation of this order is supported.

Definition at line 460 of file d1func.h.

10.225.4.33 virtual std::ostream& coco::d1func::print_add (std::ostream & *o*) const [inline, virtual, inherited]

additional info written in DAG format (it must contain dag lines)

Reimplemented in coco::dag_d1func.

Definition at line 208 of file d1func.h.

10.225.4.34 virtual std::string coco::d1func::print_params ( ) const [inline, virtual, inherited]

the parameters written in printable form

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 211 of file d1func.h.

10.225.4.35 virtual void coco::d1func::raise_order (unsigned int *neworder*) [inline, protected, virtual, inherited]

raise the order of the supported function evaluation to `neworder`

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 215 of file d1func.h.

10.225.4.36 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual, inherited]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.225.4.37 virtual uint64_t coco::d1func::thash ( ) [pure virtual, inherited]

the pure hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.225.4.38 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const [inherited]

Definition at line 2415 of file d1func.cc.

10.225.5 Member Data Documentation

10.225.5.1 std::vector<func_info> coco::d1func::_f [protected, inherited]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.225.5.2 int coco::d1func::basic_diff [protected, inherited]

basic differentiability

Definition at line 160 of file d1func.h.

10.225.5.3 double coco::d1func::dod_left [protected, inherited]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.225.5.4 double coco::d1func::dod_right [protected, inherited]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.225.5.5 volatile int coco::d1func::MAXLEN [inherited]

maximal lenght of the interval set returned

Definition at line 167 of file d1func.h.

- search_node_id node_id (const work_node &wn) const

10.228.1 Detailed Description

This class is a work node computation hook (see work_node_comp_hook), which calculates the pending status of the work node from all constraints which are not satisfied (= pending) and keeps it in column "pending_status".

10.228.2 Constructor & Destructor Documentation

10.228.2.1 coco::pending_status_comp_hook::pending_status_comp_hook ( ) [inline]

Standard Constructor

Definition at line 48 of file pending_status_hook.h.

10.228.2.2 virtual coco::pending_status_comp_hook::~pending_status_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 51 of file pending_status_hook.h.

10.228.3 Member Function Documentation

10.228.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.228.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 238 of file comp_hook.h.

10.228.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 135 of file comp_hook.h.

10.228.3.4 bool coco::pending_status_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the column "pending_status" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 106 of file pending_status_hook.h.

10.228.3.5 bool coco::pending_status_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "pending_status" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 101 of file pending_status_hook.h.

10.228.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.228.3.7 pending_status_comp_hook* coco::pending_status_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 54 of file pending_status_hook.h.

10.228.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node wn.

Definition at line 43 of file comp_hook.cc.

10.228.3.9 void coco::pending_status_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *a* = NULL, std::list< certificate > * *b* = NULL) const [inline, virtual]

The evaluation operator of this computation hook. It stores the pending status of the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 59 of file pending_status_hook.h.

10.228.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following file:

- pending_status_hook.h

10.229 coco::pfstar_hook Class Reference

Standard Destructor

Definition at line 52 of file pfstar_hook.h.

10.229.3 Member Function Documentation

10.229.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.229.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 238 of file comp_hook.h.

10.229.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 135 of file comp_hook.h.

10.229.3.4 bool coco::pfstar_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the columns "pfstar"

Reimplemented from coco::wnc_hook_base.

Definition at line 82 of file pfstar_hook.h.

10.229.3.5 bool coco::pfstar_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "pfstar"

Reimplemented from coco::wnc_hook_base.

Definition at line 64 of file pfstar_hook.h.

10.229.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.229.3.7 pfstar_hook* coco::pfstar_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 55 of file pfstar_hook.h.

10.229.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.229.3.9 void coco::pfstar_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *add_ds* = `NULL`, std::list< certificate > * *add_cs* = `NULL`) const [inline, virtual]

The evaluation operator of this computation hook. It does nothing.

Implements coco::wnc_hook_base.

Definition at line 59 of file pfstar_hook.h.

10.229.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following file:

- pfstar_hook.h

10.230 coco::coco::point_check_feasibility Class Reference

Stored procedure checking the feasibility of a point.

Public Types

- typedef work_node_context context
- typedef bool return_type

Public Member Functions

- point_check_feasibility (vdbl::colid _x, vdbl::colid _TL, vdbl::colid _f)
- point_check_feasibility (const point_check_feasibility &_i)
- virtual ~point_check_feasibility ()
- bool operator() () const
- bool def () const
- void setcontext (const context *c, const vdbl::row *r)

10.230.1 Detailed Description

This function class is used as a stored procedure (vdbl::method) for checking the feasibility of a point stored in the "point" table in the evaluation context of a given work_node.

10.230.2 Member Typedef Documentation

10.230.2.1 typedef work_node_context coco::coco::point_check_feasibility::context

The evaluation context type

Definition at line 48 of file search_graph.cc.

10.230.2.2 typedef bool coco::coco::point_check_feasibility::return_type

The return type of the operator(), i.e. the function class.

Definition at line 66 of file search_graph.cc.

10.230.3 Constructor & Destructor Documentation

10.230.3.1 coco::coco::point_check_feasibility::point_check_feasibility (vdbl::colid _x, vdbl::colid _TL, vdbl::colid _f) [inline]

Constructor setting the relevant column ids.

Definition at line 69 of file search_graph.cc.

10.230.3.2 coco::coco::point_check_feasibility::point_check_feasibility (const point_check_feasibility & _i) [inline]

Standard Copy Constructor

Definition at line 72 of file search_graph.cc.

10.230.3.3 virtual coco::coco::point_check_feasibility::~point_check_feasibility ( ) [inline, virtual]

Standard Destructor

Definition at line 76 of file search_graph.cc.

10.230.4 Member Function Documentation

10.230.4.1 bool coco::coco::point_check_feasibility::def ( ) const [inline]

Method, which computes the default value of the stored procedure

Definition at line 81 of file search_graph.cc.

10.230.4.2 bool coco::point_check_feasibility::operator() ( ) const

Evaluation operator, which computes the value of the stored procedure

Definition at line 36 of file dbtools.cc.

10.230.4.3 void coco::coco::point_check_feasibility::setcontext (const context * c, const vdbl::row * r) [inline]

This method initializes the evaluation context and the row, preparing for the evaluation.

Definition at line 84 of file search_graph.cc.

The documentation for this class was generated from the following files:

- dbtools.h
- dbtools.cc

10.231 coco::point_check_feasibility Class Reference

Stored procedure checking the feasibility of a point.

```
#include <dbtools.h>
```

Public Types

- typedef work_node_context context
- typedef bool return_type

Public Member Functions

Protected Attributes

- std::string _action

10.232.1 Detailed Description

A specialized delta class which adds new points, e.g. local optima to the search database. It is a subclass of table_delta and is, after storing the information in the search database, converted to an annotation_delta. Therefore, no `point_undelta` class is needed.

10.232.2 Member Typedef Documentation

10.232.2.1 typedef std::vector<t_line> coco::table_delta::t_ctr [inherited]

A variable of this type holds the new table entries.

Definition at line 49 of file table_delta.h.

10.232.2.2 typedef std::pair<std::string,dbt_row> coco::table_delta::t_line [inherited]

This type specifies one row in one table.

Definition at line 47 of file table_delta.h.

10.232.3 Constructor & Destructor Documentation

10.232.3.1 coco::point_delta::point_delta ( ) [inline]

Standard Constructor

Definition at line 52 of file point_delta.h.

10.232.3.2 coco::point_delta::point_delta (const dbt_row & __p) [inline]

Constructor: the point is described, including all additional information as dbt_row in the database format. It is stored in the table point of points. The columns are

Name	Type	R/O	Description	Default
x	vector<double>	required	the coordinates	
L_mult	vector<double>	optional	the Lagrange multipliers	empty
f	double	required	the objective value	
kappa	double	optional	the KJ multiplier	1
best	bool	optional	best point found	false
verified	bool	optional	verified point	false
feasible	bool	optional	feasible point	stored procedure
optimal	bool	optional	local optimal	false
global	bool	optional	global optimal	false
relaxation	bool	optional	from relaxation	false
class	unsigned int	optional	point class	0

Definition at line 72 of file point_delta.h.

10.232.3.3 coco::point_delta::point_delta (const point_delta & __d) [inline]

Standard Copy Constructor

Definition at line 77 of file point_delta.h.

10.232.4 Member Function Documentation

10.232.4.1 void coco::table_delta::add (const t_line & _tl) [inline, inherited]

This method adds one table row.

Definition at line 95 of file table_delta.h.

10.232.4.2 void coco::table_delta::add (const std::string & _tn, const dbt_row & _r) [inline, inherited]

This method adds one row _r to the table _tn.

Definition at line 97 of file table_delta.h.

10.232.4.3 void coco::table_delta::add (const std::vector< t_line > & _tlv) [inline, inherited]

This method adds a list of table rows.

Definition at line 100 of file table_delta.h.

10.232.4.4 bool coco::point_delta::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_did*, size_t & *delta_size*) const [virtual]

Apply the delta with delta_id _d to work node _x. This will never be used, because the point_delta is converted to annotation_delta before the apply is performed.

Reimplemented from coco::table_delta.

Definition at line 36 of file point_delta.cc.

10.232.4.5 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.232.4.6 bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.232.4.7 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.232.4.8 virtual bool coco::coco::delta_base::apply3 (work_node & *_x*, const work_node & *_y*, undelta_base *& *_u*, const delta_id & *_d*, size_t & *delta_size*) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.232.4.9 void coco::table_delta::convert (work_node & *_x*, delta_base *& *_u*) [inherited]

This method converts the table delta to an annotation_delta after the information is stored in the search database. The conversion is based on work_node _x, and the generated annotation_delta is returned via _u.

Definition at line 43 of file table_delta.cc.

10.232.4.10 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.232.4.11 void coco::point_delta::create_table (work_node & _x, vdbl::standard_table *& ptb, const std::string & __t) const [virtual]

This method creates the point table in the search database for the work_node _x. A pointer ptb to the created table is set. The parameter ___t for the table name is ignored.

Reimplemented from coco::table_delta.

Definition at line 45 of file point_delta.cc.

10.232.4.12 void coco::point_delta::destroy_copy (delta_base * __d) const [inline, virtual]

Clone Destructor

Reimplemented from coco::table_delta.

Definition at line 88 of file point_delta.h.

10.232.4.13 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.232.4.14 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.232.4.15 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.232.4.16 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.232.4.17 delta coco::coco::delta_base::make_delta (const std::string & a) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.232.4.18 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.232.4.19 point_delta* coco::point_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::table_delta.

Definition at line 85 of file point_delta.h.

10.232.4.20 bool coco::point_delta::operator!= (const delta_base & *_c*) const [inline]

Reimplemented from coco::table_delta.

Definition at line 106 of file point_delta.h.

10.232.4.21 bool coco::point_delta::operator!= (const point_delta & *_c*) const [inline]

Definition at line 113 of file point_delta.h.

10.232.4.22 bool coco::table_delta::operator!= (const table_delta & *_c*) const [inline, inherited]

Definition at line 144 of file table_delta.h.

10.232.4.23 bool coco::point_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Reimplemented from coco::table_delta.

Definition at line 103 of file point_delta.h.

10.232.4.24 bool coco::point_delta::operator== (const point_delta & *_c*) const [inline]

Comparison operators

Definition at line 111 of file point_delta.h.

10.232.4.25 bool coco::table_delta::operator== (const table_delta & *_c*) const [inline, inherited]

Comparison operators

Definition at line 143 of file table_delta.h.

10.232.4.26 void coco::table_delta::rm (const annotation & *_tr*) [inline, inherited]

This method adds the annotation `_tr` to the list of removed annotations.

Definition at line 104 of file table_delta.h.

10.232.4.27 void coco::table_delta::rm (const std::vector< annotation > & _trv) [inline, inherited]

This method adds the annotations in `_trv` to the list of removed annotations.

Definition at line 107 of file table_delta.h.

10.232.4.28 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.232.4.29 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.232.4.30 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.232.5 Member Data Documentation

10.232.5.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

The documentation for this class was generated from the following files:

Protected Member Functions

- bool is_cached (const node_data_type &__data)

10.233.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural interval extension.

10.233.2 Member Typedef Documentation

10.233.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.233.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.233.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.233.3 Constructor & Destructor Documentation

10.233.3.1 coco::polsppt_eval::polsppt_eval (const std::vector< interval > & *__x*, const variable_indicator & *__v*, const model & *__m*, unsigned int *_bs*, std::vector< d1func::d1func_point_t > & *_bt*, const diffI & *_bv*, const polsppt_interval_map & *_pm*, const polsppt_map_map & *_pmm*) [inline]

Constructor: __x is the box over which the function range shall be evaluated, __v is a variable indicator specifying the variables that have changed value since the last evaluation, __m specifies the DAG, and __c the cache (may be NULL). The boolean do_i determines whether the natural interval extension will use known node ranges for reducing the ranges.

Definition at line 186 of file dagd1func_pv.hpp.

10.233.3.2 coco::polsppt_eval::polsppt_eval (const polsppt_eval & __v) [inline]

10.233.4 Member Function Documentation

10.233.4.1 void coco::polsppt_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 390 of file dagd1func_pv.hpp.

10.233.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.233.4.3 polsppt_ret_type coco::polsppt_eval::calculate_value (bool *eval_all*) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< polsppt_eval_type, expression_node, polsppt_ret_type, expression_const_walker >.

Definition at line 2378 of file dagd1func_pv.hpp.

10.233.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.233.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.233.4.6 std::vector<d1func::d1func_point_t>& coco::polsppt_eval::d1fp_prod_update (const diffI & *range1*, const std::vector< d1func::d1func_point_t > & *op1*, const interval & *coeff*, diffI *range2*, std::vector< d1func::d1func_point_t > *op2*, int *expo*, std::vector< d1func::d1func_point_t > & *ret*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 930 of file dagd1func_pv.hpp.

10.233.4.7 std::vector<d1func::d1func_point_t>& coco::polsppt_eval::d1fp_sum_update (const diffI & *range1*, const std::vector< d1func::d1func_point_t > & *op1*, const interval & *coeff*, diffI *range2*, std::vector< d1func::d1func_point_t > *op2*, int *expo*, std::vector< d1func::d1func_point_t > & *ret*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 629 of file dagd1func_pv.hpp.

10.233.4.8 void coco::polsppt_eval::d1fp_type_update (const interval & *coeff*, diffI & *range2*, std::vector< d1func::d1func_point_t > & *op2*, int *expon*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 406 of file dagd1func_pv.hpp.

10.233.4.9 void coco::polsppt_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< polsppt_eval_type, expression_node, polsppt_ret_type, expression_const_walker >.

Definition at line 240 of file dagd1func_pv.hpp.

10.233.4.10 int coco::polsppt_eval::initialize (const expression_node & *__data*) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 242 of file dagd1func_pv.hpp.

10.233.4.11 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The `__data` parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.233.4.12 bool coco::polsppt_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< polsppt_eval_type, expression_node, polsppt_ret_type, expression_const_walker >.

Definition at line 109 of file dagd1func_pv.hpp.

10.233.4.13 void coco::polsppt_eval::new_base (unsigned int _b, std::vector< d1func::d1func_point_t > & _p, const diffI & _v) [inline]

This method changes the base node to _b and the base type to _p.

Definition at line 230 of file dagd1func_pv.hpp.

10.233.4.14 void coco::polsppt_eval::new_box (const std::vector< interval > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation box to ___x. The parameter ___v specifies which variables have changed value since the last evaluation.

Definition at line 223 of file dagd1func_pv.hpp.

10.233.4.15 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.233.4.16 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.233.4.17 void coco::polsppt_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 398 of file dagd1func_pv.hpp.

10.233.4.18 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.233.4.19 expression_const_walker coco::polsppt_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 217 of file dagd1func_pv.hpp.

10.233.4.20 int coco::polsppt_eval::update (const polsppt_ret_type & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 400 of file dagd1func_pv.hpp.

10.233.4.21 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.233.4.22 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.233.4.23 int coco::polsppt_eval::update (const expression_node & __data, const polsppt_ret_type & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 1397 of file dagd1func_pv.hpp.

10.233.4.24 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 763 of file search_graph.cc.

10.233.4.25 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.233.4.26 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.233.4.27 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.236.1 Detailed Description

This evaluator is used to prepare the data structure needed for computing derivatives on a DAG. For a given DAG this evaluator need only be used once. It is a cached forward evaluator.

10.236.2 Member Typedef Documentation

10.236.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.236.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.236.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.236.3 Constructor & Destructor Documentation

10.236.3.1 coco::prep_d_eval::prep_d_eval (std::vector< std::vector< double > > & __d, unsigned int _num_of_nodes) [inline]

Constructor, which takes __d as derivative data structure which is to be prepared, and the number of nodes _num_of_nodes of the DAG.

Definition at line 76 of file der_evaluator.h.

10.236.3.2 coco::prep_d_eval::prep_d_eval (const prep_d_eval & __x) [inline]

Standard Copy Constructor

Definition at line 86 of file der_evaluator.h.

10.236.3.3 coco::prep_d_eval::~prep_d_eval ( ) [inline]

Standard Destructor

Definition at line 89 of file der_evaluator.h.

10.236.4 Member Function Documentation

10.236.4.1 void coco::prep_d_eval::calculate (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 112 of file der_evaluator.h.

10.236.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.236.4.3 bool coco::prep_d_eval::calculate_value (bool eval_all) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< double > > *, expression_node, bool, expression_const_walker >.

Definition at line 119 of file der_evaluator.h.

10.236.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.236.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.236.4.6 int coco::prep_d_eval::initialize (const expression_node & __data) [inline]

Initialize method for normal nodes

Definition at line 98 of file der_evaluator.h.

10.236.4.7 void coco::prep_d_eval::initialize ( ) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< double > > *, expression_node, bool, expression_const_walker >.

Definition at line 110 of file der_evaluator.h.

10.236.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The ___data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.236.4.9 bool coco::prep_d_eval::is_cached (const expression_node & __data) [inline]

Check whether this node has already been visited

Definition at line 92 of file der_evaluator.h.

10.236.4.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.236.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.236.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.236.4.13 void coco::prep_d_eval::retrieve_from_cache (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 108 of file der_evaluator.h.

10.236.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.236.4.15 int coco::prep_d_eval::update (bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 114 of file der_evaluator.h.

10.236.4.16 int coco::prep_d_eval::update (const expression_node & __data, bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 116 of file der_evaluator.h.

10.236.4.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.236.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.236.4.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.236.4.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.236.4.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.236.4.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.237.1 Detailed Description

This evaluator is used to prepare the data structure needed for computing interval derivatives on a DAG. For a given DAG this evaluator need only be used once. It is a cached forward evaluator.

10.237.2 Member Typedef Documentation

10.237.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.237.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.237.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.237.3 Constructor & Destructor Documentation

10.237.3.1 coco::prep_id_eval::prep_id_eval (std::vector< std::vector< interval > > & __d, unsigned int _num_of_nodes) [inline]

Constructor, which takes ___d as interval derivative data structure which is to be prepared, and the number of nodes _num_of_nodes of the DAG.

Definition at line 79 of file ider_evaluator.h.

10.237.3.2 coco::prep_id_eval::prep_id_eval (const prep_id_eval & __x) [inline]

Standard Copy Constructor

Definition at line 89 of file ider_evaluator.h.

10.237.3.3 coco::prep_id_eval::~prep_id_eval ( ) [inline]

Standard Destructor

Definition at line 92 of file ider_evaluator.h.

10.237.4 Member Function Documentation

10.237.4.1 void coco::prep_id_eval::calculate (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 115 of file ider_evaluator.h.

10.237.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.237.4.3 bool coco::prep_id_eval::calculate_value (bool eval_all) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< interval > > *, expression_node, bool, expression_const_walker >.

Definition at line 122 of file ider_evaluator.h.

10.237.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.237.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.237.4.6 int coco::prep_id_eval::initialize (const expression_node & *__data*) [inline]

Initialize method for normal nodes

Definition at line 101 of file ider_evaluator.h.

10.237.4.7 void coco::prep_id_eval::initialize ( ) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< interval > > *, expression_node, bool, expression_const_walker >.

Definition at line 113 of file ider_evaluator.h.

10.237.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & *__data*) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.237.4.9 bool coco::prep_id_eval::is_cached (const expression_node & *__data*) [inline]

Check whether this node has already been visited

Definition at line 95 of file ider_evaluator.h.

10.237.4.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.237.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.237.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.237.4.13 void coco::prep_id_eval::retrieve_from_cache (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 111 of file ider_evaluator.h.

10.237.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.237.4.15 int coco::prep_id_eval::update (bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 117 of file ider_evaluator.h.

10.237.4.16 int coco::prep_id_eval::update (const expression_node & __data, bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 119 of file ider_evaluator.h.

10.237.4.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.237.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.237.4.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.237.4.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.237.4.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.237.4.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.238.1 Member Typedef Documentation

10.238.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.238.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.238.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.238.2 Constructor & Destructor Documentation

10.238.2.1 coco::prep_islp2_eval::prep_islp2_eval (std::vector< std::vector< interval > > & __c, std::vector< std::vector< interval > > & __d, std::vector< std::vector< interval > > & __h, unsigned int _num_of_nodes) [inline]

Definition at line 83 of file islp2_evaluator.h.

10.238.2.2 coco::prep_islp2_eval::prep_islp2_eval (const prep_islp2_eval & __x) [inline]

Definition at line 104 of file islp2_evaluator.h.

10.238.2.3 coco::prep_islp2_eval::~prep_islp2_eval ( ) [inline]

Definition at line 109 of file islp2_evaluator.h.

10.238.3 Member Function Documentation

10.238.3.1 void coco::prep_islp2_eval::calculate (const expression_node & __data) [inline]

Definition at line 132 of file islp2_evaluator.h.

10.238.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.238.3.3 bool coco::prep_islp2_eval::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< prep_islp2_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 144 of file islp2_evaluator.h.

10.238.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.238.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.238.3.6 void coco::prep_islp2_eval::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< prep_islp2_eval_type, expression_node, bool, expression_const_walker >.

Definition at line 111 of file islp2_evaluator.h.

10.238.3.7 int coco::prep_islp2_eval::initialize (const expression_node & __data) [inline]

Definition at line 120 of file islp2_evaluator.h.

10.238.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.238.3.9 bool coco::prep_islp2_eval::is_cached (const expression_node & *__data*) [inline]

Definition at line 113 of file islp2_evaluator.h.

10.238.3.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.238.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.238.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.238.3.13 void coco::prep_islp2_eval::retrieve_from_cache (const expression_node & *__data*) [inline]

Definition at line 118 of file islp2_evaluator.h.

10.238.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.238.3.15 int coco::prep_islp2_eval::update (bool *__rval*) [inline]

Definition at line 134 of file islp2_evaluator.h.

10.238.3.16 int coco::prep_islp2_eval::update (const expression_node & *__data*, bool *__rval*) [inline]

Definition at line 136 of file islp2_evaluator.h.

10.238.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.238.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.238.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.238.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.238.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.238.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

10.240.1 Detailed Description

This evaluator is used to prepare the data structure needed for computing first order slopes on a DAG. For a given DAG this evaluator need only be used once. It is a cached forward evaluator.

10.240.2 Member Typedef Documentation

10.240.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.240.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.240.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.240.3 Constructor & Destructor Documentation

10.240.3.1 coco::prep_islp_eval::prep_islp_eval (std::vector< std::vector< interval > > & *__d,* unsigned int *_num_of_nodes*) [inline]

Constructor, which takes __d as first order slope data structure which is to be prepared, and the number of nodes _num_of_nodes of the DAG.

Definition at line 91 of file islp_evaluator.h.

10.240.3.2 coco::prep_islp_eval::prep_islp_eval (const prep_islp_eval & *__x*) [inline]

Standard Copy Constructor

Definition at line 101 of file islp_evaluator.h.

10.240.3.3 coco::prep_islp_eval::~prep_islp_eval ( ) [inline]

Standard Destructor

Definition at line 104 of file islp_evaluator.h.

10.240.4 Member Function Documentation

10.240.4.1 void coco::prep_islp_eval::calculate (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 127 of file islp_evaluator.h.

10.240.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.240.4.3 bool coco::prep_islp_eval::calculate_value (bool *eval_all*) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< interval > > *, expression_node, bool, expression_const_walker >.

Definition at line 134 of file islp_evaluator.h.

10.240.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The ___data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.240.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.240.4.6 int coco::prep_islp_eval::initialize (const expression_node & __data) [inline]

Initialize method for normal nodes

Definition at line 113 of file islp_evaluator.h.

10.240.4.7 void coco::prep_islp_eval::initialize ( ) [inline, virtual]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Reimplemented from coco::coco::cached_forward_evaluator_base< std::vector< std::vector< interval > > *, expression_node, bool, expression_const_walker >.

Definition at line 123 of file islp_evaluator.h.

10.240.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.240.4.9 bool coco::prep_islp_eval::is_cached (const expression_node & __data) [inline]

Check whether this node has already been visited

Definition at line 107 of file islp_evaluator.h.

10.240.4.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & __data) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.240.4.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.240.4.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.240.4.13 void coco::prep_islp_eval::retrieve_from_cache (const expression_node & __data) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 125 of file islp_evaluator.h.

10.240.4.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.240.4.15 int coco::prep_islp_eval::update (bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 129 of file islp_evaluator.h.

10.240.4.16 int coco::prep_islp_eval::update (const expression_node & __data, bool __rval) [inline]

The retrieve_from_cache, initialize, calculate, calculate_value, and update methods are basically NOP versions.

Definition at line 131 of file islp_evaluator.h.

10.240.4.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.240.4.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The ___data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.240.4.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter

false.

Definition at line 763 of file search_graph.cc.

10.240.4.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.240.4.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.240.4.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter true.

Definition at line 768 of file search_graph.cc.

10.242.2.2 bool coco::projective_interval::certain_proper_superset (const proj_interval & *x*) const [inline]

Definition at line 246 of file prointerval.h.

10.242.2.3 bool coco::projective_interval::certain_subset (const proj_interval & *x*) const

Definition at line 271 of file prointerval.hpp.

10.242.2.4 bool coco::projective_interval::certain_superset (const proj_interval & *x*) const [inline]

Definition at line 232 of file prointerval.h.

10.242.2.5 bool coco::projective_interval::certainly_contains (const interval & *x*) const [inline]

Definition at line 262 of file prointerval.h.

10.242.2.6 double coco::projective_interval::diam ( ) const

Definition at line 651 of file prointerval.hpp.

10.242.2.7 bool coco::projective_interval::disjoint (const proj_interval & *x*) const

Definition at line 307 of file prointerval.hpp.

10.242.2.8 double coco::projective_interval::dist (const proj_interval & *x*) const

Returns an upper bound for the Hausdorff distance of this proj_interval and the proj_interval x, i.e.

x.dist(y) == max{ abs(x.inf()-y.inf()), abs(x.sup() - y.sup()) }

Special cases in the extended system:

- x.dist(y) == NaN for x == [EMPTY] or y == [EMPTY]

Definition at line 688 of file prointerval.hpp.

10.242.2.9 static proj_interval coco::projective_interval::EMPTY (const proj_interval & *p*) [inline, static]

Definition at line 210 of file prointerval.h.

10.242.2.10 bool coco::projective_interval::empty ( ) const [inline]

Definition at line 213 of file prointerval.h.

10.242.2.11 projective_interval< I > & coco::projective_interval::hull (const proj_interval & *x*)

Definition at line 348 of file prointerval.hpp.

10.242.2.12 projective_interval< I > & coco::projective_interval::hulldiff (const proj_interval & *x*)

Definition at line 366 of file prointerval.hpp.

10.242.2.13 double coco::projective_interval::i_inf ( ) const [inline]

Definition at line 202 of file prointerval.h.

10.242.2.14 bool coco::projective_interval::i_proper_subset (const interval & *x*) const [inline]

Definition at line 236 of file prointerval.h.

10.242.2.15 bool coco::projective_interval::i_proper_superset (const proj_interval & *x*) const [inline]

Definition at line 242 of file prointerval.h.

10.242.2.16 bool coco::projective_interval::i_subset (const proj_interval & *x*) const [inline]

Definition at line 224 of file prointerval.h.

10.242.2.17 double coco::projective_interval::i_sup ( ) const [inline]

Definition at line 203 of file prointerval.h.

10.242.2.18 bool coco::projective_interval::i_superset (const proj_interval & *x*) const [inline]

Definition at line 228 of file prointerval.h.

10.242.2.19 projective_interval< I > & coco::projective_interval::imax (const proj_interval & *x*)

The method changes this proj_interval to the maximum of itself and x.

Definition at line 407 of file prointerval.hpp.

10.242.2.20 projective_interval< I > & coco::projective_interval::imin (const proj_interval & *x*)

The method changes this proj_interval to the minimum of itself and x.

Definition at line 388 of file prointerval.hpp.

10.242.2.21 projective_interval< I > & coco::projective_interval::intersect_div (const proj_interval & *__i*, const proj_interval & *__j*)

Definition at line 435 of file prointerval.hpp.

10.242.2.22 projective_interval< I > & coco::projective_interval::intersect_invcos_wc (const proj_interval & *__i*, double *__l*, double *__d*)

Definition at line 492 of file prointerval.hpp.

10.242.2.23 projective_interval< I > & coco::projective_interval::intersect_invcosh_wc (const proj_interval & *__i*, double *__l*, double *__d*)

Definition at line 506 of file prointerval.hpp.

10.242.2.24 projective_interval< I > & coco::projective_interval::intersect_invgauss_wc (const proj_interval & *__i*, double *__l*, double *__m*, double *__s*)

Definition at line 515 of file prointerval.hpp.

10.242.2.25 projective_interval< I > & coco::projective_interval::intersect_invpower_wc (const proj_interval & *__i*, double *__l*, int *__n*)

Definition at line 467 of file prointerval.hpp.

10.242.2.26 projective_interval< I > & coco::projective_interval::intersect_invsin_wc (const proj_interval & __i, double __l, double __d)

Definition at line 476 of file prointerval.hpp.

10.242.2.27 projective_interval< I > & coco::projective_interval::intersect_invsqr_wc (const proj_interval & __i, double __l, double __d)

Definition at line 458 of file prointerval.hpp.

10.242.2.28 projective_interval< I > & coco::projective_interval::intersect_power (const proj_interval & __i, int __n)

Definition at line 445 of file prointerval.hpp.

10.242.2.29 projective_interval< I > & coco::projective_interval::intersectwith (const proj_interval & x)

Definition at line 329 of file prointerval.hpp.

10.242.2.30 projective_interval< I > & coco::projective_interval::ipow (int n)

The method changes this interval to the `n-th` power.

Definition at line 380 of file prointerval.hpp.

10.242.2.31 bool coco::projective_interval::is_bounded ( ) const [inline]

Definition at line 222 of file prointerval.h.

10.242.2.32 bool coco::projective_interval::is_empty ( ) const [inline]

Definition at line 214 of file prointerval.h.

10.242.2.33 bool coco::projective_interval::is_entire ( ) const [inline]

Definition at line 221 of file prointerval.h.

10.242.2.34 bool coco::projective_interval::is_i_thin ( ) const [inline]

Definition at line 215 of file prointerval.h.

10.242.2.35 bool coco::projective_interval::is_t_thin ( ) const [inline]

Definition at line 216 of file prointerval.h.

10.242.2.36 bool coco::projective_interval::is_unbounded_above ( ) const [inline]

Definition at line 219 of file prointerval.h.

10.242.2.37 bool coco::projective_interval::is_unbounded_below ( ) const [inline]

Definition at line 217 of file prointerval.h.

10.242.2.38 double coco::projective_interval::mag ( ) const

Returns the magnitude of this proj_interval, i.e.

a.mag() == max{abs(y) : y in a.i }

Special cases in the extended system:

- a.mag() == NaN for a == [EMPTY]
- a.mag() == +INF for any infinite proj_interval

Definition at line 682 of file prointerval.hpp.

10.242.2.39 double coco::projective_interval::mid ( ) const

Returns the midpoint of the interval part of this proj_interval, i.e.

a.mid() == (a.i.inf()+a.i.sup())/2

The following special cases are distinguished:

- a.mid() == NaN for a == [EMPTY]
- a.mid() == 0 for a == [ENTIRE]
- a.mid() == +INF for a == [a, INFTY]
- a.mid() == -INF for a == [-INFTY, a]

Definition at line 645 of file prointerval.hpp.

10.242.2.40 double coco::projective_interval::mig ( ) const

Returns the mignitude of this proj_interval, i.e.

a.mig() == min{abs(y) : y in a.i }

Special cases in the extended system:

- a.mig() == NaN for a == [EMPTY]

Definition at line 676 of file prointerval.hpp.

10.242.2.41 bool coco::projective_interval::operator!= (const proj_interval & *a*) const [inline]

Definition at line 437 of file prointerval.h.

10.242.2.42 projective_interval< I > & coco::projective_interval::operator*= (const proj_interval & *a*)

Definition at line 615 of file prointerval.hpp.

10.242.2.43 projective_interval< I > & coco::projective_interval::operator*= (double *a*)

Definition at line 623 of file prointerval.hpp.

10.242.2.44 projective_interval< I > & coco::projective_interval::operator+= (const proj_interval & *a*)

Definition at line 543 of file prointerval.hpp.

10.242.2.45 projective_interval< I > & coco::projective_interval::operator+= (double *a*)

Definition at line 561 of file prointerval.hpp.

10.242.2.46 proj_interval coco::projective_interval::operator- ( ) const [inline]

Definition at line 285 of file prointerval.h.

10.242.2.47 projective_interval< I > & coco::projective_interval::operator-= (const proj_interval & *a*)

Definition at line 579 of file prointerval.hpp.

10.242.2.48 projective_interval< I > & coco::projective_interval::operator-= (double *a*)

Definition at line 597 of file prointerval.hpp.

10.242.2.49 projective_interval< I > & coco::projective_interval::operator/= (const proj_interval & *a*)

Definition at line 630 of file prointerval.hpp.

10.242.2.50 projective_interval< I > & coco::projective_interval::operator/= (double *a*)

Definition at line 638 of file prointerval.hpp.

10.242.2.51 proj_interval& coco::projective_interval::operator= (const proj_interval & *x*) [inline]

Definition at line 276 of file prointerval.h.

10.242.2.52 proj_interval& coco::projective_interval::operator= (double *d*) [inline]

Definition at line 277 of file prointerval.h.

10.242.2.53 proj_interval& coco::projective_interval::operator= (int *d*) [inline]

Definition at line 278 of file prointerval.h.

10.242.2.54 proj_interval& coco::projective_interval::operator= (unsigned *d*) [inline]

Definition at line 279 of file prointerval.h.

10.242.2.55 proj_interval& coco::projective_interval::operator= (long *d*) [inline]

Definition at line 280 of file prointerval.h.

10.242.2.56 proj_interval& coco::projective_interval::operator= (unsigned long *d*) [inline]

Definition at line 281 of file prointerval.h.

10.242.2.57 bool coco::projective_interval::operator== (const proj_interval & *a*) const [inline]

Definition at line 434 of file prointerval.h.

10.242.2.58 const interval& coco::projective_interval::pi ( ) const [inline]

Definition at line 198 of file prointerval.h.

10.242.2.59 bool coco::projective_interval::possible_proper_subset (const proj_interval & *x*) const

Definition at line 298 of file prointerval.hpp.

10.242.2.60 bool coco::projective_interval::possible_proper_superset (const proj_interval & *x*) const [inline]

Definition at line 248 of file prointerval.h.

10.242.2.61 bool coco::projective_interval::possible_subset (const proj_interval & *x*) const

Definition at line 280 of file prointerval.hpp.

10.242.2.62 bool coco::projective_interval::possible_superset (const proj_interval & *x*) const [inline]

Definition at line 234 of file prointerval.h.

10.242.2.63 const proj_rational& coco::projective_interval::pr ( ) const [inline]

Definition at line 200 of file prointerval.h.

10.242.2.64 bool coco::projective_interval::probably_contains (const interval & *x*) const [inline]

Definition at line 267 of file prointerval.h.

10.242.2.65 double coco::projective_interval::project (double *__d*) const

Definition at line 529 of file prointerval.hpp.

10.242.2.66 const interval& coco::projective_interval::pt ( ) const [inline]

Definition at line 199 of file prointerval.h.

10.242.2.67 double coco::projective_interval::rad ( ) const

Returns an upper bound for the radius of this proj_interval, i.e.

a.rad() = (a.i.sup() - a.i.inf()) / 2

Special cases in the extended system:

- a.rad() == NaN for a == [EMPTY]
- a.rad() == +INF for any infinite proj_interval

Definition at line 670 of file prointerval.hpp.

10.242.2.68 double coco::projective_interval::rel_width ( ) const [inline]

Definition at line 252 of file prointerval.h.

10.242.2.69 double coco::projective_interval::relDiam ( ) const

Returns an upper bound for the relative diameter (width) of this proj_interval, i.e.

a.relDiam == a.diam() if a.i.mig() is less than the smallest normalized number

a.relDiam == a.diam() / a.i.mig() else

Special cases in the extended system:

- a.relDiam() == NaN for a == [EMPTY]
- a.relDiam() == +INF for any infinite proj_interval

Definition at line 664 of file prointerval.hpp.

10.242.2.70 projective_interval< I > & coco::projective_interval::round_to_integer ( )

This method rounds the proj_interval inward to integer borders.

Definition at line 426 of file prointerval.hpp.

10.242.2.71 double coco::projective_interval::safeguarded_mid ( ) const

Returns the safeguarded mid of this proj_interval, i.e.

Definition at line 696 of file prointerval.hpp.

10.242.2.72 void coco::projective_interval::set (double *lo*, double *up*, const proj_interval & *_p*)

Definition at line 221 of file prointerval.hpp.

10.243.1 Detailed Description

This class is a specialization of the global pointer class gptr, which points to a **local** object.

10.243.2 Constructor & Destructor Documentation

10.243.2.1 ptr::ptr (_Tp & __p) [inline]

This constructor initializes the ptr with a pointer to the local data structure .

Definition at line 99 of file gptr.h.

10.243.2.2 ptr::ptr (_Tp * __p) [inline]

This constructor initializes the ptr with a pointer to the local data structure pointed at by .

Definition at line 102 of file gptr.h.

10.243.2.3 ptr::ptr (const _Self & __p) [inline]

Standard Copy Constructor

Definition at line 104 of file gptr.h.

10.243.2.4 ptr::~ptr ( ) [inline]

Standard Destructor

Definition at line 107 of file gptr.h.

10.243.3 Member Function Documentation

10.243.3.1 pointer ptr::get_local_copy ( ) [inline]

This method just returns the pointer to the **local** data structur since it need not perform any data retrieval.

Definition at line 121 of file gptr.h.

10.243.3.2 const_pointer ptr::get_local_copy ( ) const [inline]

This method just returns the pointer to the **local** data structur since it need not perform any data retrieval.

Definition at line 124 of file gptr.h.

10.243.3.3 reference ptr::operator* ( ) [inline]

This is the dereferentiation operator.

Definition at line 110 of file gptr.h.

10.243.3.4 const_reference ptr::operator* ( ) const [inline]

This is the const dereferentiation operator.

Definition at line 112 of file gptr.h.

10.243.3.5 pointer ptr::operator-> ( ) [inline]

This is the pointer operator.

Definition at line 115 of file gptr.h.

10.243.3.6 const_pointer ptr::operator-> ( ) const [inline]

This is the const pointer operator.

Definition at line 117 of file gptr.h.

10.243.3.7 _Self& ptr::operator= (const _Self & __p) [inline]

Standard Assignment Operator

Definition at line 127 of file gptr.h.

10.243.3.8 _Self& ptr::operator= (_Tp & __p) [inline]

This operator assigns a ptr object from a data structure ___p.

Definition at line 129 of file gptr.h.

The documentation for this class was generated from the following file:

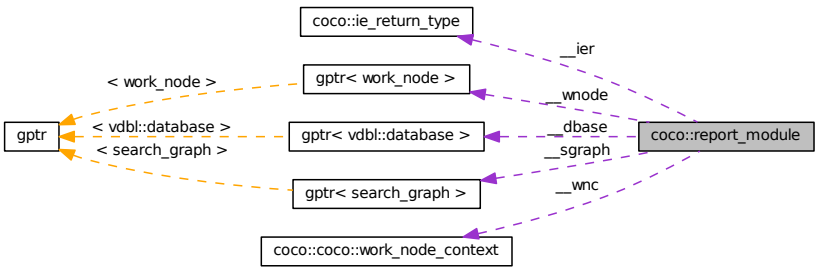
- gptr.h

10.244 coco::report_module Class Reference

Report module base class.

`#include <report_module.h>`

Collaboration diagram for coco::report_module:



Public Member Functions

- report_module (const std::string &__n, const gptr< work_node > &wnode, const gptr< search_graph > &sgraph, const search_inspector &si, const gptr< vdbl::database > &dbase, const ie_return_type &_ir)
- report_module (const std::string &__n, const gptr< work_node > &wnode, const gptr< search_graph > &sgraph, const search_inspector &si, const gptr< vdbl::database > &dbase, const ie_return_type &_ir, bool norestrict)

Protected Attributes

- std::string __name
- const gptr< work_node > * __wnode
- const gptr< search_graph > * __sgraph
- search_inspector * __sgroot
- const gptr< vdbl::database > * __dbase
- const work_node_context * __wnc
- const vdbl::viewdbase * __vdb
- const ie_return_type * __ier

10.244.1 Detailed Description

This is the base class of all COCONUT report modules. A report module produces output. Report modules are, e.g., the AMPL writer and the solution report.

10.244.2 Constructor & Destructor Documentation

10.244.2.1 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir*) [inline]

This is the most general constructor for a report module containing parameters for setting all internal variables. The parameter __n sets __name, wnode sets __wnode, sgraph sets __sgraph, si sets __sgroot, dbase sets __dbase, and _ir sets __ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 102 of file report_module.h.

10.244.2.2 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir,* bool *norestrict*) [inline]

This is the most general constructor for a report module containing parameters for setting all internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, dbase sets __dbase, and _ir sets __ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 121 of file report_module.h.

10.244.2.3 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, dbase sets __dbase, and _ir sets __ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 138 of file report_module.h.

10.244.2.4 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, dbase sets __dbase, and _ir sets __ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 155 of file report_module.h.

10.244.2.5 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, si sets __sgroot, dbase sets __dbase, and _ir sets __ier.

Definition at line 170 of file report_module.h.

10.244.2.6 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `dbase` sets __dbase, and `_ir` sets ___ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 185 of file report_module.h.

10.244.2.7 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `dbase` sets __dbase, and `_ir` sets ___ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 201 of file report_module.h.

10.244.2.8 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `si` sets __sgroot, and `_ir` sets ___ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 216 of file report_module.h.

10.244.2.9 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const ie_return_type & *_ir,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `si` sets __sgroot, and `_ir` sets ___ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 232 of file report_module.h.

10.244.2.10 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `si` sets __sgroot, and `dbase` sets __dbase. This call restricts the search database view to the specialized view for the work node.

Definition at line 248 of file report_module.h.

10.244.2.11 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, and dbase sets __dbase. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 264 of file report_module.h.

10.244.2.12 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, dbase sets __dbase, and _ir sets __ier.

Definition at line 278 of file report_module.h.

10.244.2.13 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, si sets __sgroot, and _ir sets __ier.

Definition at line 289 of file report_module.h.

10.244.2.14 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* const gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, si sets __sgroot, and dbase sets __dbase.

Definition at line 299 of file report_module.h.

10.244.2.15 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and _ir sets __ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 311 of file report_module.h.

10.244.2.16 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const ie_return_type & *_ir,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and _ir sets __ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 326 of file report_module.h.

10.244.2.17 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and dbase sets __dbase. This call restricts the search database view to the specialized view for the work node.

Definition at line 341 of file report_module.h.

10.244.2.18 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and dbase sets __dbase. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 357 of file report_module.h.

10.244.2.19 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and si sets __sgroot. This call restricts the search database view to the specialized view for the work node.

Definition at line 372 of file report_module.h.

10.244.2.20 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const gptr< search_graph > & *sgraph,* const search_inspector & *si,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and si sets __sgroot. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 388 of file report_module.h.

10.244.2.21 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, and _ir sets __ier.

Definition at line 401 of file report_module.h.

10.244.2.22 coco::report_module::report_module (const std::string & *__n,* const gptr< search_graph > & *sgraph,* const gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, and dbase sets __dbase.

Definition at line 410 of file report_module.h.

10.244.2.23 coco::report_module::report_module (const std::string & __n, const gptr< search_graph > & sgraph, const search_inspector & si) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `si` sets __sgroot.

Definition at line 419 of file report_module.h.

10.244.2.24 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< search_graph > & sgraph) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `wnode` sets __wnode. This call restricts the search database view to the specialized view for the work node.

Definition at line 430 of file report_module.h.

10.244.2.25 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< search_graph > & sgraph, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `wnode` sets __wnode. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 444 of file report_module.h.

10.244.2.26 coco::report_module::report_module (const std::string & __n, const search_inspector & si, const gptr< vdbl::database > & dbase, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `si` sets __sgroot, `dbase` sets __dbase, and `_ir` sets ___ier.

Definition at line 457 of file report_module.h.

10.244.2.27 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< vdbl::database > & dbase, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `dbase` sets __dbase, and `_ir` sets ___ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 471 of file report_module.h.

10.244.2.28 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< vdbl::database > & dbase, const ie_return_type & _ir, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, `dbase` sets __dbase, and `_ir` sets ___ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 486 of file report_module.h.

10.244.2.29 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const search_inspector & si, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, and _ir sets __ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 500 of file report_module.h.

10.244.2.30 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const search_inspector & si, const ie_return_type & _ir, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, and _ir sets __ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 515 of file report_module.h.

10.244.2.31 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const search_inspector & si, const gptr< vdbl::database > & dbase) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, and dbase sets __dbase. This call restricts the search database view to the specialized view for the work node.

Definition at line 530 of file report_module.h.

10.244.2.32 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const search_inspector & si, const gptr< vdbl::database > & dbase, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, si sets __sgroot, and dbase sets __dbase. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 545 of file report_module.h.

10.244.2.33 coco::report_module::report_module (const std::string & __n, const gptr< vdbl::database > & dbase, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, dbase sets __dbase, and _ir sets __ier.

Definition at line 558 of file report_module.h.

10.244.2.34 coco::report_module::report_module (const std::string & __n, const search_inspector & si, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, si sets __sgroot, and _ir sets __ier.

Definition at line 568 of file report_module.h.

10.244.2.35 coco::report_module::report_module (const std::string & __n, const search_inspector & si, const gptr< vdbl::database > & dbase) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, si sets __sgroot, and dbase sets __dbase.

Definition at line 578 of file report_module.h.

10.244.2.36 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const ie_return_type & _ir) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and _ir sets __ier. This call restricts the search database view to the specialized view for the work node.

Definition at line 590 of file report_module.h.

10.244.2.37 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const ie_return_type & _ir, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and _ir sets __ier. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 604 of file report_module.h.

10.244.2.38 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< vdbl::database > & dbase) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and dbase sets __dbase. This call restricts the search database view to the specialized view for the work node.

Definition at line 617 of file report_module.h.

10.244.2.39 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const gptr< vdbl::database > & dbase, bool norestrict) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and dbase sets __dbase. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 631 of file report_module.h.

10.244.2.40 coco::report_module::report_module (const std::string & __n, const gptr< work_node > & wnode, const search_inspector & si) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter __n sets __name, wnode sets __wnode, and si sets __sgroot. This call restricts the search database view to the specialized view for the work node.

Definition at line 644 of file report_module.h.

10.244.2.41 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* const search_inspector & *si,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, `wnode` sets __wnode, and `si` sets __sgroot. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 659 of file report_module.h.

10.244.2.42 coco::report_module::report_module (const std::string & *__n,* const ie_return_type & *_ir*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `_ir` sets ___ier.

Definition at line 671 of file report_module.h.

10.244.2.43 coco::report_module::report_module (const std::string & *__n,* const gptr< vdbl::database > & *dbase*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `dbase` sets __dbase.

Definition at line 679 of file report_module.h.

10.244.2.44 coco::report_module::report_module (const std::string & *__n,* const search_inspector & *si*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `si` sets __sgroot.

Definition at line 687 of file report_module.h.

10.244.2.45 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `wnode` sets __wnode. This call restricts the search database view to the specialized view for the work node.

Definition at line 697 of file report_module.h.

10.244.2.46 coco::report_module::report_module (const std::string & *__n,* const gptr< work_node > & *wnode,* bool *norestrict*) [inline]

This is a constructor for a report module containing parameters for setting some internal variables. The parameter ___n sets __name, and `wnode` sets __wnode. This call does not restrict the search database view to the specialized view for the work node, i.e. all the search database entries can be accessed.

Definition at line 709 of file report_module.h.

10.244.2.47 virtual coco::report_module::~report_module ( ) [inline, virtual]

Standard Destructor

Definition at line 718 of file report_module.h.

10.244.3 Member Function Documentation

10.244.3.1 const model* coco::report_module::get_model ( ) const [inline]

A call to this method returns a pointer to the model of the work node.

Definition at line 722 of file report_module.h.

10.244.3.2 const std::string& coco::report_module::get_name ( ) const [inline]

The get_name method returns the identifier string of the report module.

Definition at line 733 of file report_module.h.

10.244.3.3 virtual void coco::report_module::print (const control_data & *__c*, std::ostream & *o* = std::cout) const [inline, virtual]

This method is the main method of a report module. It is supposed to write the output to the ostream o. This method is overloaded by the various subclasses. Service information and parameters are provided via the control_data structure __c.

Definition at line 729 of file report_module.h.

10.244.4 Member Data Documentation

10.244.4.1 const gptr<vdbl::database>* coco::report_module::__dbase [protected]

This variable contains a global pointer to the search database.

Definition at line 86 of file report_module.h.

10.244.4.2 const ie_return_type* coco::report_module::__ier [protected]

This is a pointer to an ie_return_type.

Definition at line 93 of file report_module.h.

10.244.4.3 std::string coco::report_module::__name [protected]

This is the identifier string for a management module.

Definition at line 78 of file report_module.h.

10.244.4.4 const gptr<search_graph>* coco::report_module::__sgraph [protected]

This variable contains a global pointer to the work node.

Definition at line 82 of file report_module.h.

10.244.4.5 search_inspector* coco::report_module::__sgroot [protected]

This is a search inspector pointing to the root of the search graph.

Definition at line 84 of file report_module.h.

10.244.4.6 const vdbl::viewdbase* coco::report_module::__vdb [protected]

This is a view to the search database.

Definition at line 91 of file report_module.h.

10.244.4.7 const work_node_context* coco::report_module::__wnc [protected]

This is the work_node_context for extracting information from the search database.

Definition at line 89 of file report_module.h.

10.244.4.8 const gptr<work_node>* coco::report_module::__wnode [protected]

This variable contains a global pointer to the work node.

Definition at line 80 of file report_module.h.

10.245.1 Detailed Description

This is the exceptions class thrown by report module subclasses. Every properly coded COCONUT report module should only throw exceptions of this type.

10.245.2 Constructor & Destructor Documentation

10.245.2.1 coco::report_module_exception::report_module_exception (const std::string & *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 58 of file report_module.h.

10.245.2.2 coco::report_module_exception::report_module_exception (const char * *msg*) [inline]

Constructor, setting the message to `msg`.

Definition at line 61 of file report_module.h.

10.245.2.3 virtual coco::report_module_exception::~report_module_exception ( ) throw () [inline, virtual]

Standard Destructor

Definition at line 65 of file report_module.h.

10.245.3 Member Function Documentation

10.245.3.1 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file expression.h.

10.245.3.2 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.245.3.3 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.245.3.4 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.245.3.5 virtual std::string coco::coco::api_exception::message ( ) const throw () [inline, virtual, inherited]

This method returns the message as C++-string.

Definition at line 104 of file search_graph.cc.

10.245.3.6 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.245.3.7 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.245.3.8 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file expression.h.

10.245.3.9 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.245.3.10 virtual api_exception_type coco::coco::api_exception::type ( ) const throw () [inline, virtual, inherited]

This method returns the exception type as enum value.

Definition at line 95 of file search_graph.cc.

10.245.3.11 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.245.3.12 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.245.3.13 const char * coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

Definition at line 57 of file api_exception.cc.

10.245.3.14 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.245.3.15 virtual const char* coco::coco::api_exception::type_str ( ) const throw () [virtual, inherited]

This method returns the exception type as C-string.

10.245.3.16 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.245.3.17 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.245.3.18 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file expression.h.

10.245.3.19 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

10.245.3.20 virtual char const* coco::coco::api_exception::what ( ) const throw () [inline, virtual, inherited]

This method returns the message as C-string.

Definition at line 89 of file search_graph.cc.

- certificate make_certificate (const std::string &c)
- certificate make_certificate (const std::string &c)
- certificate make_certificate (const std::string &c)

Protected Attributes

- std::string _contents

10.246.1 Detailed Description

The rigorous module certificate for inference engines, which do not produce certificates but rather always work in a rigorous mode!

10.246.2 Constructor & Destructor Documentation

10.246.2.1 coco::rigorous_module_certificate::rigorous_module_certificate (const std::string & *_name*) [inline]

Constructor with parameter _name specifying the module_name

Definition at line 270 of file api_cert.h.

10.246.2.2 coco::rigorous_module_certificate::rigorous_module_certificate (const rigorous_module_certificate & *__c*) [inline]

Standard Copy Constructor

Definition at line 273 of file api_cert.h.

10.246.2.3 virtual coco::rigorous_module_certificate::~rigorous_module_certificate ( ) [inline, virtual]

Standard Destructor

Definition at line 282 of file api_cert.h.

10.246.3 Member Function Documentation

10.246.3.1 void coco::rigorous_module_certificate::destroy_copy (certificate_base * *__c*) const [inline]

Clone Destructor

Definition at line 293 of file api_cert.h.

10.246.3.2 std::string coco::rigorous_module_certificate::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate. This method includes the module-_name in the return value.

Reimplemented from coco::coco::certificate_base.

Definition at line 303 of file api_cert.h.

10.246.3.3 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.246.3.4 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.246.3.5 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.246.3.6 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.246.3.7 rigorous_module_certificate* coco::rigorous_module_certificate::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::certificate_base.

Definition at line 285 of file api_cert.h.

10.246.3.8 bool coco::rigorous_module_certificate::operator!= (const certificate_base & *_c*) const [inline]

Definition at line 310 of file api_cert.h.

10.246.3.9 bool coco::rigorous_module_certificate::operator!= (const rigorous_module_certificate & *_c*) const [inline]

Definition at line 317 of file api_cert.h.

10.246.3.10 bool coco::rigorous_module_certificate::operator== (const certificate_base & _c) const [inline]

Comparison operators

Definition at line 307 of file api_cert.h.

10.246.3.11 bool coco::rigorous_module_certificate::operator== (const rigorous_module_certificate & _c) const [inline]

Comparison operators

Definition at line 315 of file api_cert.h.

10.246.3.12 bool coco::rigorous_module_certificate::verify (const work_node & _x) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. In this class: `true`.

Reimplemented from coco::coco::certificate_base.

Definition at line 298 of file api_cert.h.

10.246.4 Member Data Documentation

10.246.4.1 std::string coco::coco::certificate_base::_contents [protected, inherited]

The contents (descriptive string, type) of this certificate

Definition at line 128 of file search_graph.cc.

The documentation for this class was generated from the following file:

- api_cert.h

10.247 coco::search_graph Class Reference

The search graph.

10.247.1 Detailed Description

This is the class holding the search graph. It is basically a DAG of search_node pointers pointing to either delta_node or full_node entries. There can be more than one search graph in the same strategy.

10.247.2 Constructor & Destructor Documentation

10.247.2.1 coco::search_graph::search_graph (model & *root_model*, gptr< vdbl::database > & *_db*) [inline]

Constructor, which generates a new search graph from an original model `root_model`. The search database `_db` must already be created and is likewise passed to the constructor.

Definition at line 35 of file search_graph.hpp.

10.247.2.2 coco::search_graph::search_graph (model & *root_model*, gptr< vdbl::database > & *_db*, const std::vector< annotation > & *_a*) [inline]

Constructor, which generates a new search graph from an original model `root_model` together with initial model annotations `_a`. The search database `_db` must already be created and is likewise passed to the constructor.

Definition at line 54 of file search_graph.hpp.

10.247.2.3 coco::search_graph::~search_graph ( ) [inline]

Destructor

Definition at line 74 of file search_graph.hpp.

10.247.3 Member Function Documentation

10.247.3.1 bool coco::search_graph::add_deltas (const search_focus & *where*, const std::vector< delta_id > & *del_vec*)

The add_deltas method adds the additional deltas in `del_vec` to the search_node at position `where`. The method returns `true` if adding the deltas was successful, i.e. if the node at `where` is a delta_node.

Definition at line 881 of file search_graph.cc.

10.247.3.2 void coco::search_graph::apply_hooks (work_node & *w*, const search_node_id & *id*, vdbl::rowid & *rid*, std::list< delta_id > & *add_dis*)

The apply_hooks method is called right after a split for all the generated nodes right before they are stored in the search graph. It calls all registered work node computation hooks in order to store information in the "search info" table.

Definition at line 951 of file search_graph.cc.

10.247.3.3 search_graph::search_inspector coco::search_graph::child (search_inspector & *n*, unsigned int *i*) [inline]

The child method creates a new search inspector pointing to the `i`th child of the search node at `n`.

Definition at line 102 of file search_graph.hpp.

10.247.3.4 void coco::search_graph::destroy_focus (const search_focus & *_sf*)

This method destroys the search focus `_sf`.

Definition at line 184 of file search_graph.cc.

10.247.3.5 void coco::search_graph::destroy_inspector (const search_inspector & *inspector_to_destroy*)

Calling the destroy_inspector with parameter `inspector_to_destroy` destroys the search_inspector passed.

Definition at line 225 of file search_graph.cc.

10.247.3.6 work_node coco::search_graph::extract (const search_inspector & *where*) const

This method extracts a work_node from the search_node at position `where`.

Definition at line 404 of file search_graph.cc.

10.247.3.7 work_node coco::search_graph::extract (const search_focus & *where*) const

This method extracts a work_node from the search_node at position `where`.

Definition at line 434 of file search_graph.cc.

10.247.3.8 void coco::search_graph::extract (work_node & *wnode*, const search_inspector & *where*) const

This method extracts a work_node from the search_node at position `where` and puts it into `wnode`.

Definition at line 382 of file search_graph.cc.

10.247.3.9 void coco::search_graph::extract (work_node & *wnode,* const search_focus & *where*) const

This method extracts a work_node from the search_node at position `where` and puts it into `wnode`.

Definition at line 393 of file search_graph.cc.

10.247.3.10 search_graph::search_inspector coco::search_graph::get (search_node_id *id*) const [inline]

A call to the get method retrieves the position of the search node with search_node_id `id` in the search graph.

Definition at line 120 of file search_graph.hpp.

10.247.3.11 const search_focus & coco::search_graph::get_focus (const search_inspector & *_si,* bool & *isNew*)

This method creates a new focus to `_si` or returns an existing one if present. `isNew` is set to true if the focus was newly created and has to be destroyed.

Definition at line 163 of file search_graph.cc.

10.247.3.12 inference_module_cache& coco::search_graph::get_inf_mod_cache ( ) [inline]

This method returns a reference to the inference module cache.

Definition at line 169 of file search_graph.h.

10.247.3.13 search_node_id coco::search_graph::get_node_id ( ) [inline]

This method returns the next available search_node_id.

Definition at line 154 of file search_graph.h.

10.247.3.14 search_graph_context* coco::search_graph::get_search_graph_context ( ) [inline]

This method returns the actual search graph context

Definition at line 157 of file search_graph.h.

10.247.3.15 const search_graph_context* coco::search_graph::get_search_graph_context ( ) const [inline]

This method returns the actual search graph context

Definition at line 160 of file search_graph.h.

10.247.3.16 vdbl::viewdbase& coco::search_graph::get_viewdbase ( ) [inline]

This method returns the actual view database.

Definition at line 163 of file search_graph.h.

10.247.3.17 const vdbl::viewdbase& coco::search_graph::get_viewdbase ( ) const [inline]

This method returns the actual view database.

Definition at line 166 of file search_graph.h.

10.247.3.18 search_inspector & coco::search_graph::insert (const search_focus & *where,* const search_node & *what*)

A call to the insert method stores the search_node `what` as a child of the search_node at position `where` in the search graph.

Definition at line 495 of file search_graph.cc.

10.247.3.19 search_inspector & coco::search_graph::insert (const search_focus & *where,* search_node * *what*)

A call to the insert method stores the search_node `what` as a child of the search_node at position `where` in the search graph. The pointer `what` is marked for deletion on destruction of the search graph.

Definition at line 510 of file search_graph.cc.

10.247.3.20 search_focus & coco::search_graph::new_focus (const search_inspector & *_si*)

This method creates a new focus and sets it on the node to which the search_inspector `_si` points.

Definition at line 151 of file search_graph.cc.

10.247.3.21 search_inspector & coco::search_graph::new_inspector (const search_inspector & *inspector_to_add*)

This method creates a new search_inspector pointing to `inspector_to_add`, unless there is already such a search inspector.

Definition at line 214 of file search_graph.cc.

10.247.3.22 search_inspector& coco::search_graph::new_inspector ( ) [inline]

This method creates a new search_inspector pointing to the ground node of the search graph.

Definition at line 202 of file search_graph.h.

10.247.3.23 search_graph::search_inspector coco::search_graph::parent (search_inspector & *n,* unsigned int *i*) [inline]

The parent method creates a new search inspector pointing to the `i`th parent of the search node at `n`.

Definition at line 111 of file search_graph.hpp.

10.247.3.24 bool coco::search_graph::possible_focus (const search_inspector & *_si,* const search_focus & *not_this*) const

This method checks whether a new focus can be created on the node to which the search_inspector `_si` points.

Definition at line 143 of file search_graph.cc.

10.247.3.25 bool coco::search_graph::possible_focus (const search_inspector & *_si,* const std::list< search_focus >::const_iterator * *not_this* = NULL) const

This method checks whether a new focus can be created on the node to which the search_inspector _si points.

Definition at line 107 of file search_graph.cc.

10.247.3.26 search_focus & coco::search_graph::promote (search_focus & *_sf*)

This method promotes a reduction node to its parent position if and only if the parent of the node is unique. The search_focus _sf points to the node to be promoted.

Definition at line 695 of file search_graph.cc.

10.247.3.27 bool coco::search_graph::register_hook (const work_node_comp_hook & *wnch*)

This method registers the new work node computation hook wnch.

Definition at line 897 of file search_graph.cc.

10.247.3.28 void coco::search_graph::remove (search_focus & *_sf*)

A call to remove deletes the search_node at position _sf from the search graph.

Definition at line 681 of file search_graph.cc.

10.247.3.29 void coco::search_graph::remove_upwards (search_focus & *_sf,* bool *relaxation_kills*)

A call to remove_upwards deletes the search_node at position _sf from the search graph and then recursively all its parents as long as the parents have either search_node_relation snr_glue or snr_reduction. The parent is also deleted if the search_node_relation is snr_relaxation and relaxation_kills is true.

Definition at line 830 of file search_graph.cc.

10.247.3.30 search_inspector & coco::search_graph::replace (search_focus & *where,* const search_node & *what*)

The replace method replaces the search_node at position where by the search_node what.

Definition at line 527 of file search_graph.cc.

10.247.3.31 search_focus & coco::search_graph::set_focus (search_focus & *_fc,* const search_inspector & *_si*)

A call to this method moves the search_focus _fc from its current position to the search node to which _si points.

Definition at line 193 of file search_graph.cc.

10.247.3.32 bool coco::search_graph::unregister_hook (const std::string & *name*)

This method unregisters the work node computation hook with name name.

Definition at line 931 of file search_graph.cc.

10.247.3.33 search_focus & coco::search_graph::update (work_node & *wnode,* search_focus & *foc,* const search_inspector & *where*)

This method updates the search focus `foc` to the new position `where` and updates the work_node `wnode` accordingly.

Definition at line 484 of file search_graph.cc.

10.247.3.34 search_focus & coco::search_graph::update_and_delete (work_node & *wnode,* search_focus & *foc,* const search_inspector & *where,* bool *just_this,* bool *relaxation_kills*)

This method updates the search focus `foc` to the new position `where` and updates the work_node `wnode` accordingly. Then it removes the node at the old focus and if `just_this` is false it recursively deletes all its parents as long as the parents have either search_node_relation snr_glue or snr_reduction. The parent is also deleted if the search_node_relation is snr_relaxation and relaxation_kills is `true`.

Definition at line 464 of file search_graph.cc.

10.247.4 Member Data Documentation

10.247.4.1 gptr<vdbl::database>* coco::search_graph::__dbase

The __dbase variable holds a pointer to the global pointer to the search database.

Definition at line 89 of file search_graph.h.

10.247.4.2 vdbl::userid coco::search_graph::__dbuser

The __dbuser variable holds the database user id for accessing the search database.

Definition at line 92 of file search_graph.h.

10.247.4.3 vdbl::viewdbase coco::search_graph::__vdbf

This is a full window view to the search database to be used by the inference engines and report modules.

Definition at line 98 of file search_graph.h.

10.247.4.4 std::list<delta_id> coco::search_graph::db_deltas_to_remove

This list contains all delta_id entries which have to be removed from the search database during search_node deletion.

Definition at line 86 of file search_graph.h.

10.247.4.5 std::list<walker> coco::search_graph::focus

This variable holds the list of currently active search focusses.

Definition at line 68 of file search_graph.h.

10.247.4.6 std::list<const_walker> coco::search_graph::inspector

This variable holds the list of currently registered search inspectors.

Definition at line 70 of file search_graph.h.

10.247.4.7 search_inspector coco::search_graph::inspector_for_root

This member holds a search_inspector pointing to the root node.

Definition at line 75 of file search_graph.h.

10.247.4.8 ptr<search_node> coco::search_graph::ptr_ground

This member points to the ground of the search graph.

Definition at line 77 of file search_graph.h.

10.247.4.9 ptr<model> coco::search_graph::ptr_root_model

This member contains a generalized local pointer pointing to the root model (the original model).

Definition at line 80 of file search_graph.h.

10.247.4.10 search_node* coco::search_graph::root

This member points to the root of the search graph.

Definition at line 73 of file search_graph.h.

10.247.4.11 std::list<search_node*> coco::search_graph::search_nodes_to_deallocate

This list contains all search nodes whose memory has to be freed during search_node deletion.

Definition at line 83 of file search_graph.h.

10.247.4.12 search_graph_context* coco::search_graph::sgc

This is the search graph context corresponding to the current work node.

Definition at line 95 of file search_graph.h.

The documentation for this class was generated from the following files:

- search_graph.h
- search_graph.cc
- search_graph.hpp

10.248 coco::search_graph_context Class Reference

An evaluation context when retrieving from the search database.

```
#include <sgraphctx.h>
```

Public Member Functions

- search_graph_context ()

- search_graph_context (const gptr< search_graph > *_i)
- search_graph_context (search_graph &_i)
- search_graph_context (const search_graph_context &_s)
- virtual ~search_graph_context ()
- search_graph_context & operator= (const search_graph_context &_s)
- const gptr< search_graph > * sg () const

10.248.1 Detailed Description

This class provides the evaluation context when a view to the search database is created for a graph analyzer. This mainly influences the stored procedures (vdbl::method).

10.248.2 Constructor & Destructor Documentation

10.248.2.1 coco::search_graph_context::search_graph_context ( ) [inline]

Standard Constructor

Definition at line 54 of file sgraphctx.h.

10.248.2.2 coco::search_graph_context::search_graph_context (const gptr< search_graph > * _i) [inline]

Constructor which initializes the search_graph to _i.

Definition at line 56 of file sgraphctx.h.

10.248.2.3 coco::search_graph_context::search_graph_context (search_graph & _i) [inline]

Constructor which initializes the search_graph to _i.

Definition at line 58 of file sgraphctx.h.

10.248.2.4 coco::search_graph_context::search_graph_context (const search_graph_context & _s) [inline]

10.249.1 Detailed Description

This is the base type of the nodes stored in the search graph and analyzed by the inference engines. Its subclasses delta_node and full_node are used in the search graph. The special subclass work_node of full_node is used to present the models to be analyzed to the inference engines.

10.249.2 Constructor & Destructor Documentation

10.249.2.1 coco::search_node::search_node (const search_node_id & *_i*, const vdbl::userid & *_dui*, gptr< search_node > & *_gm*, gptr< vdbl::database > & *_db*, search_node_relation *__snr* = snr_reduction)

This constructor generates a new search node (a reduction node by default) with search_node_id `i` and search_node_relation `__snr`. The parameters `_gm`, `_db`, and `_dui` initialize the global model, search database, and the database user id, respectively.

10.249.2.2 coco::search_node::search_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< search_node > * _gm, gptr< vdbl::database > & _db, search_node_relation __snr = snr_reduction)

This constructor generates a new search node (a reduction node by default) with search_node_id i and search_node_relation ___snr. The parameters _gm, _db, and _dui initialize the global model, search database, and the database user id, respectively.

10.249.2.3 coco::search_node::search_node (const search_node & __sn)

Standard Copy Constructor

10.249.2.4 coco::search_node::search_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< vdbl::database > & _db, search_node_relation __snr = snr_root)

This constructor generates a new search node (the graph's root node by default) with search_node_id i and search_node_relation ___snr. The parameters _db, and _dui initialize the search database and the database user id, respectively. The global model pointer is set to NULL. The constructor can be used for standalone nodes, as well.

10.249.2.5 virtual coco::search_node::~search_node ( ) [virtual]

Standard Destructor

10.249.3 Member Function Documentation

10.249.3.1 gptr<vdbl::database>* coco::search_node::database ( ) const [inline]

This is the accessor method for the search database.

Definition at line 157 of file search_node.h.

This is the accessor method for the database user id.

Definition at line 151 of file search_node.h.

10.249.3.3 search_node_id coco::search_node::get_id ( ) const [inline]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_node.h.

10.249.3.4 vdbl::rowid coco::search_node::get_rowid ( ) const [inline]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_node.h.

10.249.3.5 gptr<search_node>* coco::search_node::global_model ( ) const [inline]

This is the accessor method for the global model.

Definition at line 154 of file search_node.h.

10.249.3.6 virtual bool coco::search_node::is_delta ( ) const [inline, virtual]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node).

See also

delta.

Definition at line 115 of file search_node.h.

10.249.3.7 void coco::search_node::keep (const annotation & _an) [inline]

A call to this method informs the search node to be the keeper of the annotation _an.

Definition at line 173 of file search_node.h.

10.249.3.8 void coco::search_node::keep (const std::vector< annotation > & _anv) [inline]

A call to this method informs the search node to be the keeper of all the annotations in _anv.

Definition at line 177 of file search_node.h.

10.249.3.9 search_node& coco::search_node::operator= (const search_node & __w)

Standard Assignment Operator

10.249.3.10 search_node_relation coco::search_node::parent_relation ( ) const [inline, protected]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_node.h.

10.249.3.11 void coco::search_node::set_id (const search_node_id & i) [inline]

This is the set method for the search node id of this node.

Definition at line 163 of file search_node.h.

10.249.3.12 void coco::search_node::set_rowid (const vdbl::rowid & i) [inline]

This is the set method for the row id of this node.

Definition at line 169 of file search_node.h.

10.249.3.13 void coco::search_node::unkeep (const annotation & _an)

A call to this method informs the search node to no longer be the keeper of the annotation _an.

10.249.3.14 void coco::search_node::unkeep (const std::vector< annotation > & _anv)

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

10.249.4 Friends And Related Function Documentation

10.249.4.1 friend class search_graph [friend]

Definition at line 188 of file search_node.h.

10.249.5 Member Data Documentation

10.249.5.1 gptr<vdbl::database>* coco::search_node::__dbase [protected]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_node.h.

10.249.5.2 gptr<search_node>* coco::search_node::__global_model [protected]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_node.h.

10.249.5.3 vdbl::userid coco::search_node::_dbuser [protected]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_node.h.

10.249.5.4 search_node_id coco::search_node::_id [protected]

This is the unique identifier of this search node.

Definition at line 97 of file search_node.h.

10.249.5.5 std::vector<annotation> coco::search_node::_keep [protected]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_node.h.

10.249.5.6 vdbl::rowid coco::search_node::_rid [protected]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_node.h.

10.249.5.7 search_node_relation coco::search_node::_snr [protected]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_node.h.

Definition at line 188 of file search_graph.cc.

10.250.5 Member Data Documentation

10.250.5.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.250.5.2 gptr<search_node>* coco::coco::search_node::__global_model [protected]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.250.5.3 vdbl::userid coco::coco::search_node::_dbuser [protected]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.250.5.4 search_node_id coco::coco::search_node::_id [protected]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.250.5.5 std::vector<annotation> coco::coco::search_node::_keep [protected]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.250.5.6 vdbl::rowid coco::coco::search_node::_rid [protected]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.250.5.7 search_node_relation coco::coco::search_node::_snr [protected]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

The documentation for this class was generated from the following files:

- search_node.h
- search_node.hpp

10.251 coco::semantics Class Reference

Expression Semantics.

Friends

- std::ostream & operator<< (std::ostream &o, const semantics &__s)

  C++ stream output operator for semantics.

10.251.1 Detailed Description

This class is used to describe additional semantics information associated to an expression_node in the expression DAG.

10.251.2 Constructor & Destructor Documentation

10.251.2.1 coco::semantics::semantics ( )

Standard Constructor

10.251.2.2 coco::semantics::semantics (const semantics & __s) [inline]

Standard Copy Constructor

Definition at line 140 of file semantics.h.

10.251.2.3 coco::semantics::~semantics ( ) [inline]

Standard Destructor

Definition at line 148 of file semantics.h.

10.251.3 Member Function Documentation

10.251.3.1 const activity_descr& coco::semantics::activity ( ) const [inline]

This is the accessor for the activity description in the property_flags structure.

Definition at line 206 of file semantics.h.

10.251.3.2 void coco::semantics::activity (const activity_descr & __c) [inline]

This is the storage method for the activity description in the property_flags structure.

Definition at line 209 of file semantics.h.

10.251.3.3 const convex_e& coco::semantics::convexity ( ) const [inline]

This is the accessor for the convex_e specifier in the property_flags structure.

Definition at line 192 of file semantics.h.

10.251.3.4 void coco::semantics::convexity (const convex_e & __c) [inline]

This is the storage method for the convex_e specifier in the property_flags structure.

Definition at line 195 of file semantics.h.

10.251.3.5 bool coco::semantics::hard_flag ( ) const [inline]

This is the accessor for the hard (constraint) flag in the annotation_flags structure.

Definition at line 227 of file semantics.h.

10.251.3.6 void coco::semantics::hard_flag (bool __c) [inline]

This is the storage method for the hard (constraint) flag in the annotation_flags structure.

Definition at line 230 of file semantics.h.

10.251.3.7 bool coco::semantics::inactive ( ) const [inline]

This method returns whether the constraint is known to be inactive.

Definition at line 258 of file semantics.h.

10.251.3.8 bool coco::semantics::inactive_hi ( ) const [inline]

This method returns whether the constraint is known to be inactive at the upper bound.

Definition at line 251 of file semantics.h.

10.251.3.9 bool coco::semantics::inactive_lo ( ) const [inline]

This method returns whether the constraint is known to be inactive at the lower bound.

Definition at line 255 of file semantics.h.

10.251.3.10 bool coco::semantics::integer_flag ( ) const [inline]

This is the accessor for the integer flag in the annotation_flags structure.

Definition at line 220 of file semantics.h.

10.251.3.11 void coco::semantics::integer_flag (bool __c) [inline]

This is the storage method for the integer flag in the annotation_flags structure.

Definition at line 223 of file semantics.h.

10.251.3.12 bool coco::semantics::is_at_either_bound ( ) const [inline]

This is the accessor for the is_at_either_bound flag in the property_flags structure.

Definition at line 234 of file semantics.h.

10.251.3.13 void coco::semantics::is_at_either_bound (bool __c) [inline]

This is the storage method for the is_at_either_bound flag in the property_flags structure.

Definition at line 237 of file semantics.h.

10.251.3.14 bool coco::semantics::kj_flag ( ) const [inline]

This is the accessor for the KJ flag in the annotation_flags structure.

Definition at line 213 of file semantics.h.

10.251.3.15 void coco::semantics::kj_flag (bool __c) [inline]

This is the storage method for the KJ flag in the annotation_flags structure.

Definition at line 216 of file semantics.h.

10.251.3.16 void coco::semantics::merge (const semantics & __s)

This method merges this semantics structure with the structure __s.

10.251.3.17 void coco::semantics::read (char * c)

A call to this method reads a semantics structure from the C string c (.dag format).

10.251.3.18 bool coco::semantics::redundancy ( ) const [inline]

This method returns whether the constraint is known to be redundant.

Definition at line 247 of file semantics.h.

10.251.3.19 const tristate& coco::semantics::separability ( ) const [inline]

This is the accessor for the seperable entry in the property_flags structure.

Definition at line 199 of file semantics.h.

10.251.3.20 void coco::semantics::separability (const tristate & __c) [inline]

This is the storage method for the seperable entry in the property_flags structure.

Definition at line 202 of file semantics.h.

10.251.3.21 const type_annotation& coco::semantics::type ( ) const [inline]

This is the accessor for the type specifier in the annotation_flags structure.

Definition at line 241 of file semantics.h.

10.251.3.22 void coco::semantics::type (const type_annotation & __c) [inline]

This is the storage method for the type specifier in the annotation_flags structure.

Definition at line 244 of file semantics.h.

10.251.4 Friends And Related Function Documentation

10.251.4.1 std::ostream& operator<< (std::ostream & o, const semantics & __s) [friend]

This operator writes a semantics expression in .dag format to an `ostream`.

Definition at line 224 of file semantics.cc.

10.251.5 Member Data Documentation

10.251.5.1 unsigned int coco::semantics::_0chnbase

This member specifies the node number of the base of the 0-chain (univariate subgraph) leading to this node.

Definition at line 120 of file semantics.h.

10.251.5.2 activity_descr coco::semantics::act

The activity information for constraints

Definition at line 99 of file semantics.h.

10.251.5.3 int coco::semantics::addinfo

for KJ variables this numbe is the corresponding constraint number, -1 if kappa (for objective)

Definition at line 124 of file semantics.h.

10.251.5.4 struct { ... } coco::semantics::annotation_flags

The annotation_flags describe model specific properties

10.251.5.5 convex_e coco::semantics::c_info

The convexity structure for any node

Definition at line 98 of file semantics.h.

10.251.5.6 int coco::semantics::degree

This member holds the polynomial degree of the expression this node represents, and it is -1 in case of a non-polynomial non-linearity

Definition at line 128 of file semantics.h.

10.251.5.7 int coco::semantics::dim

The dim member stores the number of variables involved in that expression (the apparent dimension).

Definition at line 131 of file semantics.h.

10.251.5.8 bool coco::semantics::hard

a hard or soft constraint?

Definition at line 110 of file semantics.h.

10.251.5.9 tristate coco::semantics::has_0chnbase

node has a 0-chain base?

Definition at line 115 of file semantics.h.

10.251.5.10 struct { ... } coco::semantics::info_flags

The info_flags describe algorithmic properties

10.251.5.11 bool coco::semantics::integer

integer (not real) value?

Definition at line 108 of file semantics.h.

10.251.5.12 bool coco::semantics::is_at_either_bound

Whether a constraint is known to be on either bound (unknown on which)

Definition at line 101 of file semantics.h.

10.251.5.13 bool coco::semantics::kj

from KJ conditions?

Definition at line 107 of file semantics.h.

10.251.5.14 struct { ... } coco::semantics::property_flags

The property_flags describe mathematical constraint properties

10.251.5.15 tristate coco::semantics::separable

The seperability information for any node.

Definition at line 100 of file semantics.h.

10.251.5.16 int coco::semantics::stage

This describes the stage to which this node belongs in a multistage problem.

Definition at line 134 of file semantics.h.

10.251.5.17 type_annotation coco::semantics::type

a exists, forall, free, stochastic type

Definition at line 109 of file semantics.h.

The documentation for this class was generated from the following file:

10.252.3 Member Function Documentation

10.252.3.1 const activity_descr& coco::coco::semantics::activity ( ) const [inline]

This is the accessor for the activity description in the property_flags structure.

Definition at line 206 of file search_graph.cc.

10.252.3.2 void coco::coco::semantics::activity (const activity_descr & __c) [inline]

This is the storage method for the activity description in the property_flags structure.

Definition at line 209 of file search_graph.cc.

10.252.3.3 const convex_e& coco::coco::semantics::convexity ( ) const [inline]

This is the accessor for the convex_e specifier in the property_flags structure.

Definition at line 192 of file search_graph.cc.

10.252.3.4 void coco::coco::semantics::convexity (const convex_e & __c) [inline]

This is the storage method for the convex_e specifier in the property_flags structure.

Definition at line 195 of file search_graph.cc.

10.252.3.5 bool coco::coco::semantics::hard_flag ( ) const [inline]

This is the accessor for the hard (constraint) flag in the annotation_flags structure.

Definition at line 227 of file search_graph.cc.

10.252.3.6 void coco::coco::semantics::hard_flag (bool __c) [inline]

This is the storage method for the hard (constraint) flag in the annotation_flags structure.

Definition at line 230 of file search_graph.cc.

10.252.3.7 bool coco::coco::semantics::inactive ( ) const [inline]

This method returns whether the constraint is known to be inactive.

Definition at line 258 of file search_graph.cc.

10.252.3.8 bool coco::coco::semantics::inactive_hi ( ) const [inline]

This method returns whether the constraint is known to be inactive at the upper bound.

Definition at line 251 of file search_graph.cc.

10.252.3.9 bool coco::coco::semantics::inactive_lo ( ) const [inline]

This method returns whether the constraint is known to be inactive at the lower bound.

Definition at line 255 of file search_graph.cc.

10.252.3.10 bool coco::coco::semantics::integer_flag ( ) const [inline]

This is the accessor for the integer flag in the annotation_flags structure.

Definition at line 220 of file search_graph.cc.

10.252.3.11 void coco::coco::semantics::integer_flag (bool __c) [inline]

This is the storage method for the integer flag in the annotation_flags structure.

Definition at line 223 of file search_graph.cc.

10.252.3.12 bool coco::coco::semantics::is_at_either_bound ( ) const [inline]

This is the accessor for the is_at_either_bound flag in the property_flags structure.

Definition at line 234 of file search_graph.cc.

10.252.3.13 void coco::coco::semantics::is_at_either_bound (bool __c) [inline]

This is the storage method for the is_at_either_bound flag in the property_flags structure.

Definition at line 237 of file search_graph.cc.

10.252.3.14 bool coco::coco::semantics::kj_flag ( ) const [inline]

This is the accessor for the KJ flag in the annotation_flags structure.

Definition at line 213 of file search_graph.cc.

10.252.3.15 void coco::coco::semantics::kj_flag (bool __c) [inline]

This is the storage method for the KJ flag in the annotation_flags structure.

Definition at line 216 of file search_graph.cc.

10.252.3.16 void coco::semantics::merge (const semantics & __s) [inline]

This method merges this semantics structure with the structure ___s.

Definition at line 322 of file search_graph.cc.

10.252.3.17 void coco::semantics::read (char * c)

A call to this method reads a semantics structure from the C string c (.dag format).

Definition at line 129 of file semantics.cc.

10.252.3.18 bool coco::coco::semantics::redundancy ( ) const [inline]

This method returns whether the constraint is known to be redundant.

Definition at line 247 of file search_graph.cc.

10.252.3.19 const tristate& coco::coco::semantics::separability ( ) const [inline]

This is the accessor for the seperable entry in the property_flags structure.

Definition at line 199 of file search_graph.cc.

10.252.3.20 void coco::coco::semantics::separability (const tristate & __c) [inline]

This is the storage method for the seperable entry in the property_flags structure.

Definition at line 202 of file search_graph.cc.

10.252.3.21 const type_annotation& coco::coco::semantics::type ( ) const [inline]

This is the accessor for the type specifier in the annotation_flags structure.

Definition at line 241 of file search_graph.cc.

10.252.3.22 void coco::coco::semantics::type (const type_annotation & __c) [inline]

This is the storage method for the type specifier in the annotation_flags structure.

Definition at line 244 of file search_graph.cc.

10.252.4 Friends And Related Function Documentation

10.252.4.1 std::ostream& operator<< (std::ostream & o, const semantics & __s) [friend]

This operator writes a semantics expression in .dag format to an `ostream`.

Definition at line 224 of file semantics.cc.

10.252.5 Member Data Documentation

10.252.5.1 unsigned int coco::coco::semantics::_0chnbase

This member specifies the node number of the base of the 0-chain (univariate subgraph) leading to this node.

Definition at line 120 of file search_graph.cc.

10.252.5.2 activity_descr coco::coco::semantics::act

The activity information for constraints

Definition at line 99 of file search_graph.cc.

10.252.5.3 int coco::coco::semantics::addinfo

for KJ variables this numbe is the corresponding constraint number, -1 if kappa (for objective)

Definition at line 124 of file search_graph.cc.

Standard Constructor

Definition at line 272 of file semantics_delta.h.

10.253.2.2 coco::semantics_delta::semantics_delta (const std::vector< unsigned int > & __i, const std::vector< uint32_t > & __b)

Constructor which explicitly assigns the indices __i and the vector of already encoded semantics structures __b.

Definition at line 35 of file semantics_delta.cc.

10.253.2.3 coco::semantics_delta::semantics_delta (unsigned int __i, uint32_t __b) [inline]

Constructor which explicitly assigns one index __i and the corresponding already encoded semantics structure __b.

Definition at line 280 of file semantics_delta.h.

10.253.2.4 coco::semantics_delta::semantics_delta (const semantics_delta & __d) [inline]

Standard Copy Constructor

Definition at line 285 of file semantics_delta.h.

10.253.3 Member Function Documentation

10.253.3.1 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.253.3.2 bool coco::semantics_delta::apply (work_node & _x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const

Apply the delta with delta_id _d to work node _x, hereby changing the bounds as requested.

Definition at line 223 of file semantics_delta.cc.

10.253.3.3 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.253.3.4 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.253.3.5 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.253.3.6 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.253.3.7 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.253.3.8 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.253.3.9 void coco::semantics_delta::decode (uint32_t e, semantics & s) const [inline]

This method decodes a whole semantics structure from the encoded structure e.

Definition at line 259 of file semantics_delta.h.

10.253.3.10 void coco::semantics_delta::decode_activity (uint32_t e, activity_descr & a) const [inline]

This method decodes the activity_descr part from the encoded semantics structure e.

Definition at line 235 of file semantics_delta.h.

10.253.3.11 void coco::semantics_delta::decode_convex (uint32_t e, convex_e & c) const [inline]

This method decodes the convex_e part from the encoded semantics structure e.

Definition at line 231 of file semantics_delta.h.

10.253.3.12 void coco::semantics_delta::decode_hard (uint32_t e, bool & b) const [inline]

This method decodes the hard bool from the encoded semantics structure e.

Definition at line 247 of file semantics_delta.h.

10.253.3.13 void coco::semantics_delta::decode_integer (uint32_t e, bool & b) const [inline]

This method decodes the integer bool from the encoded semantics structure e.

Definition at line 243 of file semantics_delta.h.

10.253.3.14 void coco::semantics_delta::decode_is_at_either_bound (uint32_t *e*, bool & *b*) const [inline]

This method decodes the is_at_either_bound bool from the encoded semantics structure `e`.

Definition at line 239 of file semantics_delta.h.

10.253.3.15 void coco::semantics_delta::decode_separable (uint32_t *e*, tristate & *t*) const [inline]

This method decodes the separable tristate from the encoded semantics structure `e`.

Definition at line 251 of file semantics_delta.h.

10.253.3.16 void coco::semantics_delta::decode_type (uint32_t *e*, type_annotation & *a*) const [inline]

This method decodes the type_annotation part from the encoded semantics structure `e`.

Definition at line 255 of file semantics_delta.h.

10.253.3.17 void coco::semantics_delta::destroy_copy (delta_base * *__d*) const [inline]

Clone Destructor

Definition at line 297 of file semantics_delta.h.

10.253.3.18 uint32_t coco::semantics_delta::encode (const semantics & *s*) const [inline]

This method encodes a whole semantics structure.

Definition at line 217 of file semantics_delta.h.

10.253.3.19 uint32_t coco::semantics_delta::encode_activity (uint32_t *e*, const activity_descr & *a*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of a new activity_descr `a`.

Definition at line 194 of file semantics_delta.h.

10.253.3.20 uint32_t coco::semantics_delta::encode_convex (uint32_t *e*, const convex_e & *c*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of a new convex_e `c`.

Definition at line 190 of file semantics_delta.h.

10.253.3.21 uint32_t coco::semantics_delta::encode_hard (uint32_t *e*, bool *b*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of the boolean `hard`.

Definition at line 206 of file semantics_delta.h.

10.253.3.22 uint32_t coco::semantics_delta::encode_integer (uint32_t *e*, bool *b*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of the boolean `integer`.

Definition at line 202 of file semantics_delta.h.

10.253.3.23 uint32_t coco::semantics_delta::encode_is_at_either_bound (uint32_t *e*, bool *b*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of the boolean `is_at_either_bound`.

Definition at line 198 of file semantics_delta.h.

10.253.3.24 uint32_t coco::semantics_delta::encode_separable (uint32_t *e*, const tristate & *t*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of the tristate `separable`.

Definition at line 210 of file semantics_delta.h.

10.253.3.25 uint32_t coco::semantics_delta::encode_type (uint32_t *e*, const type_annotation & *a*) const [inline]

This method adds to an already existing encoding of a semantics change the encoding of the type_-annotation.

Definition at line 214 of file semantics_delta.h.

10.253.3.26 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.253.3.27 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.253.3.28 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.253.3.29 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.253.3.30 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.253.3.31 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action a.

Definition at line 175 of file search_graph.cc.

10.253.3.32 semantics_delta* coco::semantics_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Definition at line 295 of file semantics_delta.h.

10.253.3.33 bool coco::semantics_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 398 of file semantics_delta.h.

10.253.3.34 bool coco::semantics_delta::operator!= (const semantics_delta & *_c*) const [inline]

Definition at line 406 of file semantics_delta.h.

10.253.3.35 bool coco::semantics_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Definition at line 395 of file semantics_delta.h.

10.253.3.36 bool coco::semantics_delta::operator== (const semantics_delta & *_c*) const [inline]

Comparison operators

Definition at line 403 of file semantics_delta.h.

10.253.3.37 void coco::semantics_delta::set (const std::vector< unsigned int > & *_i*, const std::vector< uint32_t > & *_s*)

This method sets the vector of indices to _i and the vector of **encoded** semantics to _s.

Definition at line 58 of file semantics_delta.cc.

10.253.3.38 void coco::semantics_delta::set (const std::vector< unsigned int > & *_i*, const std::vector< semantics > & *_s*)

This set method sets the semantics structure for all nodes whose node numbers are in _i to the semantics information stored in the corresponding entry of vector _s.

Definition at line 48 of file semantics_delta.cc.

10.253.3.39 void coco::semantics_delta::set (unsigned int _i, const semantics & _s)

This set method sets the semantics structure for the nodes with node number _i to the semantics information stored in _s.

Definition at line 127 of file semantics_delta.cc.

10.253.3.40 void coco::semantics_delta::set_activity (const std::vector< unsigned int > & _i, const std::vector< activity_descr > & a)

This set_activity method sets the activity_descr part of the semantics structure for all nodes whose node numbers are in _i to the activity_descr information stored in the corresponding entry of vector a. All other semantics information remains unchanged.

Definition at line 77 of file semantics_delta.cc.

10.253.3.41 void coco::semantics_delta::set_activity (unsigned int _i, const activity_descr & a)

This set_activity method sets the activity_descr part of the semantics structure for the node with node number _i to the activity_descr information stored in a. All other semantics information remains unchanged.

Definition at line 153 of file semantics_delta.cc.

10.253.3.42 void coco::semantics_delta::set_convex (const std::vector< unsigned int > & _i, const std::vector< convex_e > & c)

This set_convex method sets the convex_e part of the semantics structure for all nodes whose node numbers are in _i to the convex_e information stored in the corresponding entry of vector c. All other semantics information remains unchanged.

Definition at line 67 of file semantics_delta.cc.

10.253.3.43 void coco::semantics_delta::set_convex (unsigned int _i, const convex_e & c)

This set_convex method sets the convex_e part of the semantics structure for the node with node number _i to the convex_e information stored in c. All other semantics information remains unchanged.

Definition at line 139 of file semantics_delta.cc.

10.253.3.44 void coco::semantics_delta::set_hard (const std::vector< unsigned int > & _i, const std::vector< bool > & b)

This set_hard method sets the hard entry of the semantics structure for all nodes whose node numbers are in _i to the bool information stored in the corresponding entry of vector b. All other semantics information remains unchanged.

Definition at line 107 of file semantics_delta.cc.

10.253.3.45 void coco::semantics_delta::set_hard (unsigned int _i, bool b)

This set_hard method sets the hard entry of the semantics structure for the node with node number _i to the bool information stored in b. All other semantics information remains unchanged.

Definition at line 195 of file semantics_delta.cc.

10.253.3.46 void coco::semantics_delta::set_integer (const std::vector< unsigned int > & _i, const std::vector< bool > & b)

This set_integer method sets the integer entry of the semantics structure for all nodes whose node numbers are in _i to the bool information stored in the corresponding entry of vector b. All other semantics information remains unchanged.

Definition at line 97 of file semantics_delta.cc.

10.253.3.47 void coco::semantics_delta::set_integer (unsigned int _i, bool b)

This set_integer method sets the integer entry of the semantics structure for the node with node number _i to the bool information stored in b. All other semantics information remains unchanged.

Definition at line 181 of file semantics_delta.cc.

10.253.3.48 void coco::semantics_delta::set_is_at_either_bound (const std::vector< unsigned int > & _i, const std::vector< bool > & b)

This set_is_at_either_bound method sets the is_at_either_bound entry of the semantics structure for all nodes whose node numbers are in _i to the bool information stored in the corresponding entry of vector b. All other semantics information remains unchanged.

10.253.3.49 void coco::semantics_delta::set_is_at_either_bound (unsigned int _i, bool b)

This set_is_at_either_bound method sets the is_at_either_bound entry of the semantics structure for the node with node number _i to the bool information stored in b. All other semantics information remains unchanged.

10.253.3.50 void coco::semantics_delta::set_separable (const std::vector< unsigned int > & _i, const std::vector< tristate > & t)

This set_separable method sets the separable entry of the semantics structure for all nodes whose node numbers are in _i to the tristate information stored in the corresponding entry of vector t. All other semantics information remains unchanged.

Definition at line 87 of file semantics_delta.cc.

10.253.3.51 void coco::semantics_delta::set_separable (unsigned int _i, const tristate & t)

This set_separable method sets the separable entry of the semantics structure for the node with node number _i to the tristate information stored in t. All other semantics information remains unchanged.

Definition at line 167 of file semantics_delta.cc.

10.253.3.52 void coco::semantics_delta::set_type (const std::vector< unsigned int > & _i, const std::vector< type_annotation > & a)

This set_type method sets the type_annotation part of the semantics structure for all nodes whose node numbers are in _i to the type_annotation information stored in the corresponding entry of vector a. All other semantics information remains unchanged.

Definition at line 117 of file semantics_delta.cc.

10.253.3.53 void coco::semantics_delta::set_type (unsigned int *_i*, const type_annotation & *a*)

This set_type method sets the type_annotation part of the semantics structure for the node with node number `_i` to the type_annotation information stored in `a`. All other semantics information remains unchanged.

Definition at line 209 of file semantics_delta.cc.

10.253.3.54 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.253.3.55 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.253.3.56 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.254.1 Detailed Description

This class is used to specify undo information for changes to the node semantics within a model. This class undoes the apply of a semantics_delta.

10.254.2 Constructor & Destructor Documentation

10.254.2.1 coco::semantics_undelta::semantics_undelta (const std::vector< unsigned int > & __i, const std::vector< uint32_t > & __s) [inline]

Constructor, setting `indices` to `__i`, the `old_f_sem` to `__s`.

Definition at line 55 of file semantics_delta.h.

10.254.2.2 coco::semantics_undelta::semantics_undelta (const std::vector< unsigned int > & __i) [inline]

Constructor, setting `indices` to `__i`, and leaving `old_f_sem` empty.

Definition at line 61 of file semantics_delta.h.

10.254.2.3 coco::semantics_undelta::semantics_undelta (const semantics_undelta & __d) [inline]

Standard Copy Constructor

Definition at line 65 of file semantics_delta.h.

10.254.3 Member Function Documentation

10.254.3.1 void coco::semantics_undelta::destroy_copy (undelta_base * __d) const [inline]

Clone Destructor

Definition at line 77 of file semantics_delta.h.

10.254.3.2 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.254.3.3 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.254.3.4 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.254.3.5 semantics_undelta* coco::semantics_undelta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::undelta_base.

Definition at line 75 of file semantics_delta.h.

10.254.3.6 bool coco::semantics_undelta::unapply (work_node & *_x*, const delta_id & *_did*) const [virtual]

Undo the semantics_delta with delta_id _i in work node _x

Reimplemented from coco::coco::undelta_base.

Definition at line 256 of file semantics_delta.cc.

10.254.3.7 virtual bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.254.3.8 virtual bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.254.3.9 bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [inline, virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

- model.cc

10.257 coco::model::sort_constraints Class Reference

`#include <model.hpp>`

Public Member Functions

- bool operator() (const walker &_c1, const walker &_c2) const

10.257.1 Detailed Description

This function class is used to compare constraints and objectives for constraint and objective sorting.

10.257.2 Member Function Documentation

10.257.2.1 bool coco::model::sort_constraints::operator() (const walker & *_c1*, const walker & *_c2*) const [inline]

Definition at line 882 of file model.hpp.

The documentation for this class was generated from the following file:

- model.hpp

10.258 coco::sparsity3_visitor Class Reference

Preorder visitor which calculates sparsity structures.

Public Member Functions

- sparsity3_visitor (stlist &__o, int __n, bool __b=false)
- sparsity3_visitor (const sparsity3_visitor &__c)

- bool preorder (const expression_node &r)
- const variable_indicator & vvalue ()
- const variable_indicator & value ()
- void collect (const expression_node &r, const variable_indicator &__v)

10.258.1 Detailed Description

This preorder visitor is used to calculate the sparsity structure of 3rd derivatives.

10.258.2 Constructor & Destructor Documentation

10.258.2.1 coco::sparsity3_visitor::sparsity3_visitor (stlist & __o, int __n, bool __b = false) [inline]

Constructor, which initializes the output variable holding the sparsity structure to __o, and the number of variables to __n. If __b is true, the array base is set to 1, and to 0 otherwise.

Definition at line 122 of file sparsity3.cc.

10.258.2.2 coco::sparsity3_visitor::sparsity3_visitor (const sparsity3_visitor & __c) [inline]

Standard Copy Constructor

Definition at line 127 of file sparsity3.cc.

10.258.3 Member Function Documentation

10.258.3.1 void coco::sparsity3_visitor::collect (const expression_node & r, const variable_indicator & __v) [inline]

This is a method as needed by a preorder visitor.

Definition at line 251 of file sparsity3.cc.

10.258.3.2 bool coco::sparsity3_visitor::preorder (const expression_node & r) [inline]

This is a method as needed by a preorder visitor.

Definition at line 134 of file sparsity3.cc.

10.258.3.3 const variable_indicator& coco::sparsity3_visitor::value ( ) [inline]

This is a method as needed by a preorder visitor.

Definition at line 249 of file sparsity3.cc.

10.258.3.4 const variable_indicator& coco::sparsity3_visitor::vvalue ( ) [inline]

This is a method as needed by a preorder visitor.

Definition at line 248 of file sparsity3.cc.

The documentation for this class was generated from the following file:

- sparsity3.cc

10.259 coco::sparsity_visitor Class Reference

Preorder visitor which calculates sparsity structures.

Public Member Functions

- sparsity_visitor (splist &__o, int __n, bool __b=false)
- sparsity_visitor (const sparsity_visitor &__c)

- bool preorder (const expression_node &r)
- const variable_indicator & vvalue ()
- const variable_indicator & value ()
- void collect (const expression_node &r, const variable_indicator &__v)

10.259.1 Detailed Description

This preorder visitor is used to calculate the sparsity structure of Hessians and Jacobi matrices.

10.259.2 Constructor & Destructor Documentation

10.259.2.1 coco::sparsity_visitor::sparsity_visitor (splist & __o, int __n, bool __b = false) [inline]

Constructor, which initializes the output variable holding the sparsity structure to __o, and the number of variables to __n. If __b is true, the array base is set to 1, and to 0 otherwise.

Definition at line 116 of file sparsity.cc.

10.259.2.2 coco::sparsity_visitor::sparsity_visitor (const sparsity_visitor & __c) [inline]

Standard Copy Constructor

Definition at line 121 of file sparsity.cc.

10.259.3 Member Function Documentation

10.259.3.1 void coco::sparsity_visitor::collect (const expression_node & *r*, const variable_indicator & *__v*) [inline]

This is a method as needed by a preorder visitor.

Definition at line 251 of file sparsity.cc.

10.259.3.2 bool coco::sparsity_visitor::preorder (const expression_node & *r*) [inline]

This is a method as needed by a preorder visitor.

Definition at line 128 of file sparsity.cc.

10.259.3.3 const variable_indicator& coco::sparsity_visitor::value ( ) [inline]

This is a method as needed by a preorder visitor.

Definition at line 249 of file sparsity.cc.

10.259.3.4 const variable_indicator& coco::sparsity_visitor::vvalue ( ) [inline]

This is a method as needed by a preorder visitor.

Definition at line 248 of file sparsity.cc.

The documentation for this class was generated from the following file:

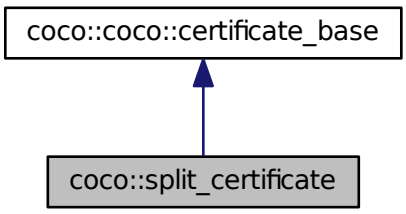
- sparsity.cc

10.260 coco::split_certificate Class Reference

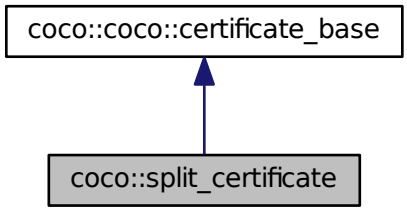
The certificate for deltas formed by splits.

`#include <api_cert.h>`

Inheritance diagram for coco::split_certificate:



Collaboration diagram for coco::split_certificate:



Public Member Functions

- split_certificate ()
- split_certificate (const std::string &mn)

- certificate make_certificate (const std::string &c)

Protected Attributes

- std::string _contents

10.260.1 Detailed Description

The split certificate for generated splits.

10.260.2 Constructor & Destructor Documentation

10.260.2.1 coco::split_certificate::split_certificate ( ) [inline]

Standard Constructor

Definition at line 141 of file api_cert.h.

10.260.2.2 coco::split_certificate::split_certificate (const std::string & *mn*) [inline]

Standard Constructor with explicit module name mn

Definition at line 144 of file api_cert.h.

10.260.2.3 coco::split_certificate::split_certificate (const split_certificate & *__c*) [inline]

Standard Copy Constructor

Definition at line 147 of file api_cert.h.

10.260.2.4 virtual coco::split_certificate::~split_certificate ( ) [inline, virtual]

Standard Destructor

Definition at line 156 of file api_cert.h.

10.260.3 Member Function Documentation

10.260.3.1 void coco::split_certificate::destroy_copy (certificate_base * *__c*) const [inline]

Clone Destructor

Definition at line 167 of file api_cert.h.

10.260.3.2 std::string coco::split_certificate::get_contents ( ) const [inline, virtual]

Retrieve the contents information (the certificate type) for this certificate. This method includes the module_name in the return value.

Reimplemented from coco::coco::certificate_base.

Definition at line 177 of file api_cert.h.

10.260.3.3 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.260.3.4 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents c.

Definition at line 156 of file search_graph.cc.

10.260.3.5 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.260.3.6 certificate coco::coco::certificate_base::make_certificate (const std::string & *c*) [inline, inherited]

Construct a certificate from this certificate_base with the contents `c`.

Definition at line 156 of file search_graph.cc.

10.260.3.7 split_certificate* coco::split_certificate::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::certificate_base.

Definition at line 159 of file api_cert.h.

10.260.3.8 bool coco::split_certificate::operator!= (const certificate_base & *_c*) const [inline]

Definition at line 184 of file api_cert.h.

10.260.3.9 bool coco::split_certificate::operator!= (const split_certificate & *_c*) const [inline]

Definition at line 191 of file api_cert.h.

10.260.3.10 bool coco::split_certificate::operator== (const certificate_base & *_c*) const [inline]

Comparison operators

Definition at line 181 of file api_cert.h.

10.260.3.11 bool coco::split_certificate::operator== (const split_certificate & *_c*) const [inline]

Comparison operators

Definition at line 189 of file api_cert.h.

10.260.3.12 bool coco::split_certificate::verify (const work_node & *_x*) const [inline, virtual]

Verification Test: Verify whether the certificate verifies the corresponding delta for work_node _x. In this class: `true`.

Reimplemented from coco::coco::certificate_base.

Definition at line 172 of file api_cert.h.

10.260.4 Member Data Documentation

10.260.4.1 std::string coco::coco::certificate_base::_contents [protected, inherited]

The contents (descriptive string, type) of this certificate

Definition at line 128 of file search_graph.cc.

The documentation for this class was generated from the following file:

- api_cert.h

10.261 coco::split_delta Class Reference

Public Attributes

- std::list< std::vector< delta > > splits

Protected Attributes

- std::string _action

10.261.1 Detailed Description

This class is used to propose useful splits and store them in the proposed_splits structure in the work_node.

10.261.2 Constructor & Destructor Documentation

10.261.2.1 coco::split_delta::split_delta ( ) [inline]

Standard Constructor

Definition at line 91 of file split_delta.h.

10.261.2.2 coco::split_delta::split_delta (unsigned int *_node_num*, const interval & *_l*, const interval & *_u*) [inline]

Constructor, which initializes a split in two subproblems. The parameter _node_num specifies which variable is split. The intervals _l and _u give the intervals into which the variable _node_num is bisected.

Definition at line 101 of file split_delta.h.

10.261.2.3 coco::split_delta::split_delta (unsigned int *_node_num*, const std::vector< interval > & *_m*) [inline]

Constructor, which initializes a split in a number of subproblems. The parameter _node_num specifies which variable is split. The vector _m gives a list of intervals into which the variable _node_num is multisected.

Definition at line 114 of file split_delta.h.

10.261.2.4 coco::split_delta::split_delta (const std::vector< unsigned int > & *_i*, const std::vector< interval > & *_l*, const std::vector< interval > & *_u*) [inline]

Constructor, which initializes a split in two subproblems. The first of the subproblems is given by a bound_delta with indices vector _i and bounds vector _l, while the second subproblem has the same index vector _i but the bounds vector _u.

Definition at line 129 of file split_delta.h.

10.261.2.5 coco::split_delta::split_delta (const std::list< std::vector< delta > > & *__dl*) [inline]

Constructor, which initializes the split member with __dl.

Definition at line 138 of file split_delta.h.

10.261.2.6 coco::split_delta::split_delta (const std::vector< unsigned int > *nnum,* const std::vector< std::pair< interval, interval > > & *bds*) [inline]

Constructor which initializes the splits member with a multisplit of 2^n subproblems, where n is the length of the nnum and bds vectors. The nnum vector specifies which nodes are to be split, and the vector contains for every node split the lower and the upper subdivision interval.

Definition at line 147 of file split_delta.h.

10.261.2.7 coco::split_delta::split_delta (const std::vector< unsigned int > *nnum,* const std::vector< std::vector< interval > > & *bds*) [inline]

Constructor which initializes the splits member with a multisplit of an exponential number of subproblems, where nnum and bds are vectors of the same length. The nnum vector specifies which nodes are to be split, and the vector contains for every node split the generated subintervals.

Definition at line 156 of file split_delta.h.

10.261.2.8 coco::split_delta::~split_delta ( ) [inline]

Standard Destructor

Definition at line 162 of file split_delta.h.

10.261.2.9 coco::split_delta::split_delta (const split_delta & *__s*) [inline]

Standard Copy Constructor

Definition at line 165 of file split_delta.h.

10.261.3 Member Function Documentation

10.261.3.1 void coco::split_delta::add_delta (const delta & *__d*) [inline]

This method adds a new subproblem in the splits determined by the single delta __d.

Definition at line 174 of file split_delta.h.

10.261.3.2 void coco::split_delta::add_deltas (const std::vector< delta > & *__d*) [inline]

This method adds a new subproblem in the splits determined by the vector of deltas __d.

Definition at line 181 of file split_delta.h.

10.261.3.3 void coco::split_delta::add_multisplit (const std::vector< unsigned int > *nnum,* const std::vector< std::pair< interval, interval > > & *bds*) [inline]

This method generates a multisplit of 2^n boxes, where n is the length of the nnum and bds vectors. The nnum vector specifies which nodes are to be split, and the vector contains for every node split the lower and the upper subdivision interval.

Definition at line 287 of file split_delta.h.

10.261.3.4 void coco::split_delta::add_multisplit (const std::vector< unsigned int > *nnum*, const std::vector< std::vector< interval > > & *bds*) [inline]

This method generates a multisplit of exponentially many boxes. The nnum vector specifies which nodes are to be split, and the vector contains for every node split the generated subdivision intervals.

Definition at line 321 of file split_delta.h.

10.261.3.5 void coco::split_delta::add_split (const std::vector< unsigned int > & *_i*, const std::vector< interval > & *_b*) [inline]

This method adds a further subproblem to the splits. It is given by a bound_delta with indices vector _i and bounds vector _b.

Definition at line 187 of file split_delta.h.

10.261.3.6 void coco::split_delta::add_split (unsigned int *_nnum*, interval *_b*) [inline]

This method adds one subproblem to the splits. The parameter _nnum specifies which variable is split. The interval _b specifies the new interval.

Definition at line 197 of file split_delta.h.

10.261.3.7 void coco::split_delta::add_split (unsigned int *_nnum*, interval *_l*, interval *_u*) [inline]

This method adds two subproblems to the splits. The parameter _nnum specifies which variable is split. The intervals _l and _u give the intervals into which the variable _node_num is bisected.

Definition at line 206 of file split_delta.h.

10.261.3.8 void coco::split_delta::add_split (const std::vector< unsigned int > & *_i*, const std::vector< interval > & *_l*, const std::vector< interval > & *_u*) [inline]

This method adds two subproblems to the splits. The first of the subproblems is given by a bound_delta with indices vector _i and bounds vector _l, while the second subproblem has the same index vector _i but the bounds vector _u.

Definition at line 216 of file split_delta.h.

10.261.3.9 virtual bool coco::coco::delta_base::apply (work_node & *_x*, undelta_base *& *_u*, const delta_id & *_di*, size_t & *delta_size*) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.261.3.10 bool coco::split_delta::apply (work_node & *x*, undelta_base *& *_u*, const delta_id & *_did*, size_t & *delta_size*) const [inline]

Apply the delta with delta_id _d to work node _x, hereby changing the bounds as requested.

Definition at line 272 of file split_delta.h.

10.261.3.11 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.261.3.12 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.261.3.13 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.261.3.14 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.261.3.15 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.261.3.16 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.261.3.17 void coco::split_delta::destroy_copy (delta_base * __d) const [inline]

Clone Destructor

Definition at line 170 of file split_delta.h.

10.261.3.18 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.261.3.19 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.261.3.20 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.261.3.21 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.261.3.22 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.261.3.23 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.261.3.24 split_delta* coco::split_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Definition at line 168 of file split_delta.h.

10.261.3.25 bool coco::split_delta::operator!= (const delta_base & *_c*) const [inline]

Definition at line 246 of file split_delta.h.

10.261.3.26 bool coco::split_delta::operator!= (const split_delta & _c) const [inline]

Definition at line 253 of file split_delta.h.

10.261.3.27 bool coco::split_delta::operator== (const delta_base & _c) const [inline]

Comparison operators

Definition at line 243 of file split_delta.h.

10.261.3.28 bool coco::split_delta::operator== (const split_delta & _c) const [inline]

Comparison operators

Definition at line 251 of file split_delta.h.

10.261.3.29 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.261.3.30 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.261.3.31 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.261.4 Member Data Documentation

10.261.4.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

10.261.4.2 std::list<std::vector<delta> > coco::split_delta::splits

splits represents a list of newly created submodels. Each of these submodels is generated from the work node by a number of deltas stored in the inner vector.

Definition at line 85 of file split_delta.h.

The documentation for this class was generated from the following file:

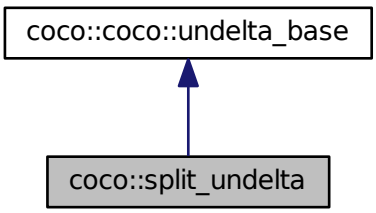
- split_delta.h

10.262 coco::split_undelta Class Reference

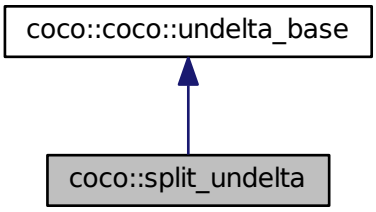
The split undelta class for removing proposed splits from a work_node.

`#include <split_delta.h>`

Inheritance diagram for coco::split_undelta:



Collaboration diagram for coco::split_undelta:



Public Member Functions

- split_undelta (const work_node::transaction_number &_se)
- split_undelta (const split_undelta &_su)
- virtual ~split_undelta ()
- split_undelta * new_copy () const
- void destroy_copy (undelta_base *__d) const

- bool unapply (work_node &x, const delta_id &_did) const
- undelta make_undelta (size_t s)
- undelta make_undelta (size_t s)
- undelta make_undelta (size_t s)
- virtual bool unapply3 (work_node &_x, const work_node &_y, const delta_id &_d) const
- virtual bool unapply3 (work_node &_x, const work_node &_y, const delta_id &_d) const
- virtual bool unapply3 (work_node &_x, const work_node &_y, const delta_id &_d) const

10.262.1 Detailed Description

This class is used to specify information for removing proposed splits from a work node. This class undoes the apply of a split_delta.

10.262.2 Constructor & Destructor Documentation

10.262.2.1 coco::split_undelta::split_undelta (const work_node::transaction_number & _se) [inline]

Constructor, which stores the transaction number _se.

Definition at line 51 of file split_delta.h.

10.262.2.2 coco::split_undelta::split_undelta (const split_undelta & _su) [inline]

Standard Copy Constructor

Definition at line 54 of file split_delta.h.

10.262.2.3 virtual coco::split_undelta::~split_undelta ( ) [inline, virtual]

Standard Destructor

Definition at line 62 of file split_delta.h.

10.262.3 Member Function Documentation

10.262.3.1 void coco::split_undelta::destroy_copy (undelta_base * __d) const [inline]

Clone Destructor

Definition at line 67 of file split_delta.h.

10.262.3.2 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.262.3.3 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.262.3.4 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline, inherited]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.262.3.5 split_undelta* coco::split_undelta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::undelta_base.

Definition at line 65 of file split_delta.h.

10.262.3.6 bool coco::split_undelta::unapply (work_node & *x*, const delta_id & *_did*) const [inline, virtual]

Undo the bound_delta with delta_id _i in work node _x

Reimplemented from coco::coco::undelta_base.

Definition at line 257 of file split_delta.h.

10.262.3.7 virtual bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.262.3.8 virtual bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.262.3.9 bool coco::coco::undelta_base::unapply3 (work_node & *_x*, const work_node & *_y*, const delta_id & *_d*) const [inline, virtual, inherited]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

Definition at line 94 of file api_delta.h.

The documentation for this class was generated from the following file:

- split_delta.h

10.263 coco::statistic_info Class Reference

Base class for all inference engine statistics classes.

`#include <ie_statistic.h>`

Public Member Functions

- statistic_info ()
- virtual ~statistic_info ()
- virtual void calc_effectiveness (int n)

Public Attributes

- double effectiveness
- int number_of_infers

10.263.1 Detailed Description

This is the base class of all statistcs classes used to keep the statistics information of all the inference engines.

10.263.2 Constructor & Destructor Documentation

10.263.2.1 coco::statistic_info::statistic_info ( ) [inline]

Standard Constructor

Definition at line 49 of file ie_statistic.h.

10.263.2.2 virtual coco::statistic_info::~statistic_info ( ) [inline, virtual]

Standard Destructor

Definition at line 51 of file ie_statistic.h.

10.263.3 Member Function Documentation

10.263.3.1 virtual void coco::statistic_info::calc_effectiveness (int *n*) [inline, virtual]

A call to this method calculates the effectiveness of the inference engine and stores the result in the `effectiveness` variable.

Definition at line 55 of file ie_statistic.h.

10.263.4 Member Data Documentation

10.263.4.1 double coco::statistic_info::effectiveness

This is the effectiveness of the engine

Definition at line 43 of file ie_statistic.h.

10.263.4.2 int coco::statistic_info::number_of_infers

The number_of_infers variable keeps the number of calls to the `infer` method of the inference engine.

Definition at line 46 of file ie_statistic.h.

The documentation for this class was generated from the following file:

- ie_statistic.h

10.264 sum_deltas Class Reference

Pre-post visitor for summing up all the deltas during work node extraction.

`#include <sum_deltas.h>`

Public Member Functions

- sum_deltas (std::list< delta_id > &_dels, std::set< search_node_id > &_nds)
- sum_deltas (std::list< delta_id > &_dels, std::set< search_node_id > &_nds, const std::set< search_node_id > &_c_nds)
- sum_deltas (std::list< delta_id > &_dels, std::set< search_node_id > &_nds, const search_node_id &_psnid)

- void vinit ()
- void vcollect (return_value const &)
- return_value vvalue ()
- bool preorder (search_node ∗const &r)
- void collect (search_node ∗const &, return_value const &ancestor)
- bool postorder (search_node ∗const &r)
- return_value value ()

Public Attributes

- std::vector< return_value > ancestors
- return_value result
- std::list< delta_id > ∗ dels
- std::set< search_node_id > ∗ nds
- const std::set< search_node_id > ∗ c_nds
- const search_node_id ∗ psnid

10.264.1 Detailed Description

This pre-post visitor is used to sum up all the deltas when a new work_node is extracted from the search_-node the focus points at.

10.264.2 Constructor & Destructor Documentation

10.264.2.1 sum_deltas::sum_deltas (std::list< delta_id > & *_dels,* std::set< search_node_id > & *_nds*) [inline]

Constructor for uncompared search

Definition at line 77 of file sum_deltas.h.

10.264.2.2 sum_deltas::sum_deltas (std::list< delta_id > & *_dels,* std::set< search_node_id > & *_nds,* const std::set< search_node_id > & *_c_nds*) [inline]

Constructor for compared search with set of parent ids

Definition at line 86 of file sum_deltas.h.

10.264.2.3 sum_deltas::sum_deltas (std::list< delta_id > & *_dels,* std::set< search_node_id > & *_nds,* const search_node_id & *_psnid*) [inline]

Constructor for compared search with single parent id

Definition at line 96 of file sum_deltas.h.

10.264.3 Member Function Documentation

10.264.3.1 void sum_deltas::collect (search_node *const & , return_value const & *ancestor*) [inline]

This method is required by a prepost_visitor.

Definition at line 141 of file sum_deltas.h.

10.264.3.2 bool sum_deltas::postorder (search_node *const & *r*) [inline]

This method is required by a prepost_visitor.

Definition at line 147 of file sum_deltas.h.

10.264.3.3 bool sum_deltas::preorder (search_node *const & *r*) [inline]

This method is required by a prepost_visitor.

Definition at line 125 of file sum_deltas.h.

10.264.3.4 return_value sum_deltas::value ( ) [inline]

This method is required by a prepost_visitor.

Definition at line 170 of file sum_deltas.h.

10.264.3.5 void sum_deltas::vcollect (return_value const &) [inline]

This method is required by a prepost_visitor.

Definition at line 112 of file sum_deltas.h.

10.264.3.6 void sum_deltas::vinit ( ) [inline]

This method is required by a prepost_visitor.

Definition at line 107 of file sum_deltas.h.

10.264.3.7 return_value sum_deltas::vvalue ( ) [inline]

This method is required by a prepost_visitor.

Definition at line 119 of file sum_deltas.h.

10.264.4 Member Data Documentation

10.264.4.1 std::vector<return_value> sum_deltas::ancestors

The return values of the ancestors

Definition at line 64 of file sum_deltas.h.

10.264.4.2 const std::set<search_node_id>* sum_deltas::c_nds

The list of search_node parents of the compared node

Definition at line 72 of file sum_deltas.h.

10.264.4.3 std::list<delta_id>* sum_deltas::dels

The list of deltas to be summed

Definition at line 68 of file sum_deltas.h.

10.264.4.4 std::set<search_node_id>* sum_deltas::nds

The list of search_node parents

Definition at line 70 of file sum_deltas.h.

10.264.4.5 const search_node_id* sum_deltas::psnid

The search_node parent until which we sum

Definition at line 74 of file sum_deltas.h.

10.264.4.6 return_value sum_deltas::result

The return value of this visit

Definition at line 66 of file sum_deltas.h.

The documentation for this class was generated from the following file:

- sum_deltas.h

10.265 coco::sum_deltas Class Reference

Pre-post visitor for summing up all the deltas during work node extraction.

Public Member Functions

Protected Attributes

- std::string _action

10.266.1 Detailed Description

A base delta class which provides all functionality to add information to the search database. It is, after storing the information in the search database, converted to an annotation_delta. Therefore, no `table_undelta` class is needed.

10.266.2 Member Typedef Documentation

10.266.2.1 typedef std::vector<t_line> coco::table_delta::t_ctr

A variable of this type holds the new table entries.

Definition at line 49 of file table_delta.h.

10.266.2.2 typedef std::pair<std::string,dbt_row> coco::table_delta::t_line

This type specifies one row in one table.

Definition at line 47 of file table_delta.h.

10.266.3 Constructor & Destructor Documentation

10.266.3.1 coco::table_delta::table_delta (const std::string & *a*) [inline]

Standard Constructor, which sets the action descriptor `a`

Definition at line 59 of file table_delta.h.

10.266.3.2 coco::table_delta::table_delta (const std::string & *a*, const t_ctr & *_n*, const std::vector< annotation > & *_r*) [inline]

Full Constructor, setting the action descriptor to `a`, the new table rows to `_n`, and the annotations that have to be removed to `_r`.

Definition at line 64 of file table_delta.h.

10.266.3.3 coco::table_delta::table_delta (const table_delta & *__d*) [inline]

Standard Copy Constructor

Definition at line 69 of file table_delta.h.

10.266.3.4 coco::table_delta::table_delta (const std::string & *a*, const std::string & *__tn*, const dbt_row & *__t*) [inline]

Constructor, setting the action descriptor to `a`, and adding one row `___t` to the table `___tn`.

Definition at line 79 of file table_delta.h.

10.266.3.5 coco::table_delta::table_delta (const std::string & *a*, const std::string & *__tn*, const std::vector< dbt_row > & *__t*) [inline]

Constructor, setting the action descriptor to `a`, and adding a list of rows `___t` to the table `___tn`.

Definition at line 85 of file table_delta.h.

10.266.4 Member Function Documentation

10.266.4.1 void coco::table_delta::add (const t_line & _tl) [inline]

This method adds one table row.

Definition at line 95 of file table_delta.h.

10.266.4.2 void coco::table_delta::add (const std::string & _tn, const dbt_row & _r) [inline]

This method adds one row _r to the table _tn.

Definition at line 97 of file table_delta.h.

10.266.4.3 void coco::table_delta::add (const std::vector< t_line > & _tlv) [inline]

This method adds a list of table rows.

Definition at line 100 of file table_delta.h.

10.266.4.4 bool coco::table_delta::apply (work_node & _x, undelta_base *& _u, const delta_id & _did, size_t & delta_size) const [virtual]

Apply the delta with delta_id _d to work node _x. This will never be used, because the point_delta is converted to annotation_delta before the apply is performed.

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 35 of file table_delta.cc.

10.266.4.5 virtual bool coco::coco::delta_base::apply (work_node & _x, undelta_base *& _u, const delta_id & _di, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x. In this process the undo information for this delta is stored in _u.

Definition at line 198 of file search_graph.cc.

10.266.4.6 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.266.4.7 bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [inline, virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

Definition at line 88 of file api_delta.h.

10.266.4.8 virtual bool coco::coco::delta_base::apply3 (work_node & _x, const work_node & _y, undelta_base *& _u, const delta_id & _d, size_t & delta_size) const [virtual, inherited]

Apply the delta with delta_id _d to work node _x, constructing in the process work_node _y, without changing _x. In this process the undo information for this delta is stored in _u. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the apply method.

10.266.4.9 void coco::table_delta::convert (work_node & _x, delta_base *& _u)

This method converts the table delta to an annotation_delta after the information is stored in the search database. The conversion is based on work_node _x, and the generated annotation_delta is returned via _u.

Definition at line 43 of file table_delta.cc.

10.266.4.10 virtual void coco::coco::delta_base::convert (work_node & _x, delta_base *& _d) [inline, virtual, inherited]

Convert this delta to a delta which can be stored in _x, this is e.g. used for all delta version, which are actually stored as annotation changes.

Definition at line 189 of file search_graph.cc.

10.266.4.11 virtual void coco::table_delta::create_table (work_node & _x, vdbl::standard_table *& ptb, const std::string & __t) const [inline, virtual]

This method creates the table with name ___t in the search database for the work_node _x. A pointer ptb to the created table is set. This method must be overloaded by the subclasses.

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 119 of file table_delta.h.

10.266.4.12 virtual void coco::table_delta::destroy_copy (delta_base * __d) const [inline, virtual]

Clone Destructor

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 114 of file table_delta.h.

10.266.4.13 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.266.4.14 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.266.4.15 const std::string& coco::coco::delta_base::get_action ( ) const [inline, inherited]

Retrieve the action information (the delta type) for this delta.

Definition at line 184 of file search_graph.cc.

10.266.4.16 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.266.4.17 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.266.4.18 delta coco::coco::delta_base::make_delta (const std::string & *a*) [inline, inherited]

Construct a delta from this delta_base with the action `a`.

Definition at line 175 of file search_graph.cc.

10.266.4.19 virtual table_delta* coco::table_delta::new_copy ( ) const [inline, virtual]

Clone Operation

Reimplemented from coco::coco::delta_base.

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 111 of file table_delta.h.

10.266.4.20 bool coco::table_delta::operator!= (const delta_base & *_c*) const [inline]

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 138 of file table_delta.h.

10.266.4.21 bool coco::table_delta::operator!= (const table_delta & *_c*) const [inline]

Definition at line 144 of file table_delta.h.

10.266.4.22 bool coco::table_delta::operator== (const delta_base & *_c*) const [inline]

Comparison operators

Reimplemented in coco::boxes_delta, and coco::point_delta.

Definition at line 135 of file table_delta.h.

10.266.4.23 bool coco::table_delta::operator== (const table_delta & _c) const [inline]

Comparison operators

Definition at line 143 of file table_delta.h.

10.266.4.24 void coco::table_delta::rm (const annotation & _tr) [inline]

This method adds the annotation `_tr` to the list of removed annotations.

Definition at line 104 of file table_delta.h.

10.266.4.25 void coco::table_delta::rm (const std::vector< annotation > & _trv) [inline]

This method adds the annotations in `_trv` to the list of removed annotations.

Definition at line 107 of file table_delta.h.

10.266.4.26 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.266.4.27 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.266.4.28 virtual void coco::coco::delta_base::unkeep ( ) [inline, virtual, inherited]

Perform this operation when the delta is released (unkept) from a work_node.

Reimplemented in coco::dag_delta.

Definition at line 194 of file search_graph.cc.

10.266.5 Member Data Documentation

10.266.5.1 std::string coco::coco::delta_base::_action [protected, inherited]

The action (type) of this delta

Definition at line 154 of file search_graph.cc.

The documentation for this class was generated from the following files:

- table_delta.h
- table_delta.cc

10.267 coco::termination_reason Class Reference

This class holds the reason of termination of inference and management modules.

`#include <termreason.h>`

Public Member Functions

- termination_reason ()
- termination_reason (int termr_r, const std::string &termr_ref)
- termination_reason (const termination_reason &__t)
- termination_reason & operator= (const termination_reason &__t)
- const std::string & get_message () const
- int get_code () const

Friends

- std::ostream & operator<< (std::ostream &o, const termination_reason &__x)

  C++ stream output operator for the termination_reason.

10.267.1 Detailed Description

This class is used to store the reason of termination of inference and management modules.

10.267.2 Constructor & Destructor Documentation

10.267.2.1 coco::termination_reason::termination_reason ( ) [inline]

This is a map for message translation. Standard Constructor

Definition at line 58 of file termreason.h.

10.267.2.2 coco::termination_reason::termination_reason (int *termr_r*, const std::string & *termr_ref*) [inline]

Constructor, setting the return code to `termr_r` and the message string to `termr_ref`.

Definition at line 62 of file termreason.h.

10.267.2.3 coco::termination_reason::termination_reason (const termination_reason & *__t*) [inline]

Standard Copy Constructor

Definition at line 66 of file termreason.h.

10.267.3 Member Function Documentation

10.267.3.1 int coco::termination_reason::get_code ( ) const [inline]

This method return the termination code.

Definition at line 81 of file termreason.h.

10.267.3.2 const std::string& coco::termination_reason::get_message ( ) const [inline]

This method return the termination message.

Definition at line 78 of file termreason.h.

10.267.3.3 termination_reason& coco::termination_reason::operator= (const termination_reason & __t) [inline]

Standard Assignment Operator

Definition at line 70 of file termreason.h.

10.267.4 Friends And Related Function Documentation

10.267.4.1 std::ostream& operator<< (std::ostream & *o*, const termination_reason & __x) [friend]

This operator writes a termination_reason (the message) to an `ostream`.

Definition at line 90 of file termreason.h.

The documentation for this class was generated from the following file:

- termreason.h

10.268.1 Member Typedef Documentation

10.268.1.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info [inherited]

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.268.1.2 typedef std::vector<point_info> coco::d1func::point_list [inherited]

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.268.2 Member Enumeration Documentation

10.268.2.1 enum coco::d1func::d1func_point_t [inherited]

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point-: At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup

d1fp_oddpoledn

d1fp_jumpldef

d1fp_jumpludef

d1fp_point
d1fp_undefined
d1fp_wild
d1fp_jumprdef
d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.268.2.2 enum coco::d1func::d1solve_t [inherited]

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0
d1solve_1
d1solve_2

Definition at line 106 of file d1func.h.

10.268.3 Constructor & Destructor Documentation

10.268.3.1 coco::testpoly_func::testpoly_func ( ) [inline]

Definition at line 57 of file d1testf.h.

10.268.4 Member Function Documentation

10.268.4.1 virtual uint64_t coco::d1func::chash ( ) [pure virtual, inherited]

the const hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.268.4.2 convex_info coco::d1func::convexity (const interval & *i*, unsigned int *k*) const [virtual, inherited]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.268.4.3 virtual std::string coco::d1func::dag_out ( ) const [inline, virtual, inherited]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 205 of file d1func.h.

10.268.4.4 virtual int coco::d1func::degree_update (int *in_degree*) const [inline, virtual, inherited]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.268.4.5 int coco::d1func::differentiability (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return differentiability information on `i`.

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 2351 of file d1func.cc.

10.268.4.6 virtual double coco::d1func::eval (double *x*, unsigned int *k*) const [pure virtual, inherited]

the point evaluation

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.268.4.7 diffNumber coco::d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual, inherited]

the diffNumber evaluation

Reimplemented in coco::dag_d1func.

Definition at line 349 of file d1func.cc.

10.268.4.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.268.4.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 390 of file d1func.cc.

10.268.4.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual, inherited]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.268.4.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.268.4.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual, inherited]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.268.4.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 794 of file d1func.cc.

10.268.4.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval first order slope evaluation at center z

Definition at line 1403 of file d1func.cc.

10.268.4.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at centers z and y

Definition at line 1984 of file d1func.cc.

10.268.4.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.268.4.17 virtual std::pair<double,double> coco::d1func::evald (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 437 of file d1func.h.

10.268.4.18 virtual void coco::d1func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual, inherited]

the point, first to third derivative evaluation

Reimplemented in coco::xexp_func.

Definition at line 443 of file d1func.h.

10.268.4.19 virtual std::triple<double,double,double> coco::d1func::evalt (double *x*, unsigned int *k*) const [inline, virtual, inherited]

the point and first and second derivative evaluation

Reimplemented in coco::xexp_func, and coco::dag_d1func.

Definition at line 440 of file d1func.h.

10.268.4.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual, inherited]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.268.4.21 virtual const char* coco::d1func::func_name ( ) const [pure virtual, inherited]

the name of the d1func.

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.268.4.22 virtual interval coco::d1func::imperfect_eval (const interval & *x*, unsigned int *k*) const [pure virtual, inherited]

the imperfect evaluation of k th derivative.

Implemented in coco::xexp_func, coco::hsf_func, and coco::dag_d1func.

10.268.4.23 virtual interval coco::testpoly_func::imperfect_eval_f0 (const interval & *x*) const [inline, protected, virtual]

the imperfect function evaluation

Definition at line 41 of file d1testf.h.

10.268.4.24 virtual interval coco::testpoly_func::imperfect_eval_f1 (const interval & *x*) const [inline, protected, virtual]

the imperfect first derivative evaluation

Definition at line 46 of file d1testf.h.

10.268.4.25 virtual interval coco::testpoly_func::imperfect_eval_f2 (const interval & *x*) const [inline, protected, virtual]

the imperfect second derivative evaluation

Definition at line 51 of file d1testf.h.

10.268.4.26 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual, inherited]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.268.4.27 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1708 of file d1func.cc.

10.268.4.28 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1778 of file d1func.cc.

10.268.4.29 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.268.4.30 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual, inherited]

the other comparison operator

Definition at line 476 of file d1func.h.

10.268.4.31 virtual bool coco::d1func::operator== (const d1func & *b*) const [inline, virtual, inherited]

the comparison operator

Reimplemented in coco::hsf_func, coco::xexp_func, and coco::dag_d1func.

Definition at line 473 of file d1func.h.

10.268.4.32 virtual bool coco::d1func::order_is_supported (unsigned int *k*) const [inline, virtual, inherited]

check whether evaluation of this order is supported.

Definition at line 460 of file d1func.h.

10.268.4.33 virtual std::ostream& coco::d1func::print_add (std::ostream & *o*) const [inline, virtual, inherited]

additional info written in DAG format (it must contain dag lines)

Reimplemented in coco::dag_d1func.

Definition at line 208 of file d1func.h.

10.268.4.34 virtual std::string coco::d1func::print_params ( ) const [inline, virtual, inherited]

the parameters written in printable form

Reimplemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

Definition at line 211 of file d1func.h.

10.268.4.35 virtual void coco::d1func::raise_order (unsigned int *neworder*) [inline, protected, virtual, inherited]

raise the order of the supported function evaluation to `neworder`

Reimplemented in coco::hsf_func, and coco::xexp_func.

Definition at line 215 of file d1func.h.

10.268.4.36 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual, inherited]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.268.4.37 virtual uint64_t coco::d1func::thash ( ) [pure virtual, inherited]

the pure hash value for hash calculation in the DAG

Implemented in coco::dag_d1func, coco::hsf_func, and coco::xexp_func.

10.268.4.38 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const [inherited]

Definition at line 2415 of file d1func.cc.

10.268.5 Member Data Documentation

10.268.5.1 std::vector<func_info> coco::d1func::_f [protected, inherited]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.268.5.2 int coco::d1func::basic_diff [protected, inherited]

basic differentiability

Definition at line 160 of file d1func.h.

10.268.5.3 double coco::d1func::dod_left [protected, inherited]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.268.5.4 double coco::d1func::dod_right [protected, inherited]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.268.5.5 volatile int coco::d1func::MAXLEN [inherited]

maximal lenght of the interval set returned

Definition at line 167 of file d1func.h.

The documentation for this class was generated from the following file:

- d1testf.h

10.269 coco::thirdderBackwardEvaluator Class Reference

10.269.1 Member Typedef Documentation

10.269.1.1 typedef _Base::const_walker coco::coco::cached_backward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 854 of file search_graph.cc.

10.269.1.2 typedef _Base::node_data_type coco::coco::cached_backward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 850 of file search_graph.cc.

10.269.1.3 typedef _Base::return_value coco::coco::cached_backward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 852 of file search_graph.cc.

10.269.2 Constructor & Destructor Documentation

10.269.2.1 coco::thirdderBackwardEvaluator::thirdderBackwardEvaluator (std::vector< std::vector< double > > * __der_data, std::vector< std::vector< double > > * __hessv_data, std::vector< std::vector< double > > * __hessw_data, std::vector< std::vector< double > > * __thirdder_data, variable_indicator & __v, const model & __m, std::vector< std::vector< double > > * __d, std::vector< std::vector< double > > * __hv, std::vector< std::vector< double > > * __hw, std::vector< std::vector< double > > * __t, std::vector< double > * __grad, std::vector< double > * __hessv, std::vector< double > * __hessw, std::vector< double > * __thirdder) [inline]

Definition at line 1327 of file thirdder_evaluator.h.

10.269.2.2 coco::thirdderBackwardEvaluator::thirdderBackwardEvaluator (const thirdderBackwardEvaluator & __he) [inline]

Definition at line 1375 of file thirdder_evaluator.h.

10.269.2.3 coco::thirdderBackwardEvaluator::~thirdderBackwardEvaluator ( ) [inline]

Definition at line 1377 of file thirdder_evaluator.h.

10.269.3 Member Function Documentation

10.269.3.1 virtual int coco::coco::cached_backward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right before all children of a node are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 922 of file search_graph.cc.

10.269.3.2 int coco::thirdderBackwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 1428 of file thirdder_evaluator.h.

10.269.3.3 bool coco::thirdderBackwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter `eval_all` is `true` whether the node is a virtual node.

Reimplemented from coco::coco::cached_backward_evaluator_base< thirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1669 of file thirdder_evaluator.h.

10.269.3.4 virtual void coco::coco::cached_backward_evaluator_base::cleanup (const node_data_type & *__data*) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The `__data` parameter contains the node data of the graph node being visited.

Definition at line 926 of file search_graph.cc.

10.269.3.5 void coco::thirdderBackwardEvaluator::cleanup (const expression_node & *__data*) [inline]

Definition at line 1557 of file thirdder_evaluator.h.

10.269.3.6 int coco::coco::cached_backward_evaluator_base::collect (const node_data_type & *__data*, const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 880 of file search_graph.cc.

10.269.3.7 void coco::thirdderBackwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_backward_evaluator_base< thirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1417 of file thirdder_evaluator.h.

10.269.3.8 bool coco::thirdderBackwardEvaluator::is_cached (const node_data_type & *__data*) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_backward_evaluator_base< thirdderBackwardEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 1314 of file thirdder_evaluator.h.

10.269.3.9 void coco::thirdderBackwardEvaluator::newPoint (std::vector< std::vector< double > > * __der_data, std::vector< std::vector< double > > * __hessv_data, std::vector< std::vector< double > > * __hessw_data, std::vector< std::vector< double > > * __thirdder_data, const variable_indicator & __v) [inline]

Definition at line 1379 of file thirdder_evaluator.h.

10.269.3.10 void coco::thirdderBackwardEvaluator::newResult (std::vector< double > * __grad, std::vector< double > * __hessv, std::vector< double > * __hessw, std::vector< double > * __thirdder) [inline]

Definition at line 1395 of file thirdder_evaluator.h.

10.269.3.11 void coco::coco::cached_backward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into a call to cleanup.

Definition at line 875 of file search_graph.cc.

10.269.3.12 int coco::coco::cached_backward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls calculate.

Definition at line 863 of file search_graph.cc.

10.269.3.13 virtual void coco::coco::cached_backward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 930 of file search_graph.cc.

10.269.3.14 void coco::thirdderBackwardEvaluator::set_mult (double scal) [inline]

Definition at line 1404 of file thirdder_evaluator.h.

10.269.3.15 expression_const_walker coco::thirdderBackwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 1413 of file thirdder_evaluator.h.

10.269.3.16 virtual int coco::coco::cached_backward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 941 of file search_graph.cc.

10.269.3.17 virtual int coco::coco::cached_backward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 952 of file search_graph.cc.

10.269.3.18 int coco::thirdderBackwardEvaluator::update (const bool & __rval) [inline]

Definition at line 1595 of file thirdder_evaluator.h.

10.269.3.19 int coco::thirdderBackwardEvaluator::update (const expression_node & __data, const bool & __rval) [inline]

Definition at line 1605 of file thirdder_evaluator.h.

10.269.3.20 return_value coco::coco::cached_backward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 892 of file search_graph.cc.

10.269.3.21 int coco::coco::cached_backward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 886 of file search_graph.cc.

10.269.3.22 void coco::coco::cached_backward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 901 of file search_graph.cc.

10.269.3.23 return_value coco::coco::cached_backward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 897 of file search_graph.cc.

10.271.2.3 coco::thirdderForwardEvaluator::~thirdderForwardEvaluator ( ) [inline]

Definition at line 287 of file thirdder_evaluator.h.

10.271.3 Member Function Documentation

10.271.3.1 void coco::thirdderForwardEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 391 of file thirdder_evaluator.h.

10.271.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.271.3.3 thirdderForwardEvaluatorReturnValue coco::thirdderForwardEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< thirdderForwardEvaluatorType, expression_node, thirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 1266 of file thirdder_evaluator.h.

10.271.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.271.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.271.3.6 void coco::thirdderForwardEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< thirdderForwardEvaluatorType, expression_node, thirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 305 of file thirdder_evaluator.h.

10.271.3.7 int coco::thirdderForwardEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 313 of file thirdder_evaluator.h.

10.271.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.271.3.9 bool coco::thirdderForwardEvaluator::is_cached (const node_data_type & __data) [inline, protected, virtual]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Reimplemented from coco::coco::cached_forward_evaluator_base< thirdderForwardEvaluatorType, expression_node, thirdderForwardEvaluatorReturnValue, expression_const_walker >.

Definition at line 191 of file thirdder_evaluator.h.

10.271.3.10 void coco::thirdderForwardEvaluator::newPoint (const std::vector< hessNumber > & __x, const variable_indicator & __v) [inline]

Definition at line 292 of file thirdder_evaluator.h.

10.271.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.271.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.271.3.13 void coco::thirdderForwardEvaluator::retrieve_from_cache (const expression_node & __data) [inline]

Definition at line 400 of file thirdder_evaluator.h.

10.271.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.271.3.15 expression_const_walker coco::thirdderForwardEvaluator::short_cut_to (const expression_node & __data) [inline]

Definition at line 289 of file thirdder_evaluator.h.

10.271.3.16 int coco::thirdderForwardEvaluator::update (const hessNumber & __rval) [inline]

Definition at line 407 of file thirdder_evaluator.h.

10.271.3.17 int coco::thirdderForwardEvaluator::update (const expression_node & __data, const thirdderForwardEvaluatorReturnValue & __rval) [inline]

Definition at line 417 of file thirdder_evaluator.h.

10.271.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.271.3.19 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The __data parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.271.3.20 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter false.

Definition at line 763 of file search_graph.cc.

10.271.3.21 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.271.3.22 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.271.3.23 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter true.

Definition at line 768 of file search_graph.cc.

10.274.1 Member Typedef Documentation

10.274.1.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.274.1.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.274.1.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.274.2 Constructor & Destructor Documentation

10.274.2.1 coco::thirdderPreparationEvaluator::thirdderPreparationEvaluator (std::vector< std::vector< double > > & __d, std::vector< std::vector< double > > & __hv, std::vector< std::vector< double > > & __hw, std::vector< std::vector< double > > & __t, unsigned int _num_of_nodes) [inline]

Definition at line 88 of file thirdder_evaluator.h.

10.274.2.2 coco::thirdderPreparationEvaluator::thirdderPreparationEvaluator (const thirdderPreparationEvaluator & __x) [inline]

Definition at line 108 of file thirdder_evaluator.h.

10.274.2.3 coco::thirdderPreparationEvaluator::~thirdderPreparationEvaluator ( ) [inline]

Definition at line 114 of file thirdder_evaluator.h.

10.274.3 Member Function Documentation

10.274.3.1 void coco::thirdderPreparationEvaluator::calculate (const expression_node & __data) [inline]

Definition at line 139 of file thirdder_evaluator.h.

10.274.3.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The __data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.274.3.3 bool coco::thirdderPreparationEvaluator::calculate_value (bool *eval_all*) [inline, virtual]

This method is called last for every graph node, and it produces the return value of the visitor. The parameter eval_all is true whether the node is a virtual node.

Reimplemented from coco::coco::cached_forward_evaluator_base< thirdderPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 151 of file thirdder_evaluator.h.

10.274.3.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.274.3.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.274.3.6 void coco::thirdderPreparationEvaluator::initialize ( ) [inline, virtual]

This method is called at a virtual node before any children are visited.

Reimplemented from coco::coco::cached_forward_evaluator_base< thirdderPreparationEvaluatorType, expression_node, bool, expression_const_walker >.

Definition at line 116 of file thirdder_evaluator.h.

10.274.3.7 int coco::thirdderPreparationEvaluator::initialize (const expression_node & __data) [inline]

Definition at line 125 of file thirdder_evaluator.h.

10.274.3.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.274.3.9 bool coco::thirdderPreparationEvaluator::is_cached (const expression_node & *__data*) [inline]

Definition at line 118 of file thirdder_evaluator.h.

10.274.3.10 virtual bool coco::coco::cached_forward_evaluator_base::is_cached (const node_data_type & *__data*) [inline, virtual, inherited]

This method checks whether the return value for this method is in the cache or can be calculated without visiting the children.

Definition at line 777 of file search_graph.cc.

10.274.3.11 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.274.3.12 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & *__data*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.274.3.13 void coco::thirdderPreparationEvaluator::retrieve_from_cache (const expression_node & *__data*) [inline]

Definition at line 123 of file thirdder_evaluator.h.

10.274.3.14 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & *__data*) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.274.3.15 int coco::thirdderPreparationEvaluator::update (bool *__rval*) [inline]

Definition at line 141 of file thirdder_evaluator.h.

10.274.3.16 int coco::thirdderPreparationEvaluator::update (const expression_node & *__data*, bool *__rval*) [inline]

Definition at line 143 of file thirdder_evaluator.h.

10.274.3.17 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & *__data*, const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.274.3.18 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & *__rval*) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.274.3.19 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.274.3.20 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & *__rval*) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.274.3.21 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.274.3.22 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

10.275.1.4 std::vector<std::vector<double> >* coco::thirdderPreparationEvaluatorType::t

Definition at line 77 of file thirdder_evaluator.h.

The documentation for this struct was generated from the following file:

- thirdder_evaluator.h

10.276 std::triple Struct Reference

triple holds three objects of arbitrary type.

`#include <stlp_triple.h>`

Public Types

- typedef _T1 first_type
  type of first entry
- typedef _T2 second_type
  type of second entry
- typedef _T3 third_type
  type of third entry

Public Member Functions

- triple ()
- triple (const _T1 &__a, const _T2 &__b, const _T3 &__c)
- template<class _U1 , class _U2 , class _U3 >
  triple (const triple< _U1, _U2, _U3 > &__t)

Public Attributes

- _T1 first
  first entry
- _T2 second
  second entry
- _T3 third
  third entry

10.276.1 Detailed Description

This class is used to hold three objects of arbitrary types. It is a slight generalization of `std::pair`.

10.276.2 Member Typedef Documentation

10.276.2.1 typedef _T1 std::triple::first_type

`first_type` is the first bound type

Definition at line 44 of file stlp_triple.h.

10.276.2.2 typedef _T2 std::triple::second_type

`second_type` is the second bound type

Definition at line 46 of file stlp_triple.h.

10.276.2.3 typedef _T3 std::triple::third_type

`third_type` is the third bound type

Definition at line 48 of file stlp_triple.h.

10.276.3 Constructor & Destructor Documentation

10.276.3.1 std::triple::triple ( ) [inline]

Definition at line 64 of file stlp_triple.h.

10.276.3.2 std::triple::triple (const _T1 & __a, const _T2 & __b, const _T3 & __c) [inline]

Three objects may be passed to a `triple` constructor to be copied.

Definition at line 69 of file stlp_triple.h.

10.276.3.3 template<class _U1 , class _U2 , class _U3 > std::triple::triple (const triple< _U1, _U2, _U3 > & __t) [inline]

There is also a templated copy constructor for the `triple` class itself.

Definition at line 76 of file stlp_triple.h.

10.276.4 Member Data Documentation

10.276.4.1 _T1 std::triple::first

`first` is a copy of the first object

Definition at line 51 of file stlp_triple.h.

10.276.4.2 _T2 std::triple::second

`second` is a copy of the second object

Definition at line 53 of file stlp_triple.h.

10.276.4.3 _T3 std::triple::third

`third` is a copy of the second object

Definition at line 55 of file stlp_triple.h.

The documentation for this struct was generated from the following file:

- stlp_triple.h

10.277 coco::undelta Class Reference

The undelta class (undo of updates to work nodes)

`#include <api_deltabase.h>`

Public Member Functions

- undelta (size_t s)
- undelta (undelta_base *__d, size_t s)
- undelta (const undelta &__d)
- ~undelta ()
- const undelta_base * get_base () const
- bool unapply (work_node &_x, const delta_id &_i) const
- bool unapply3 (work_node &_x, const work_node &_y, const delta_id &_i) const
- undelta & operator= (const undelta &_u)
- size_t delta_size () const

10.277.1 Detailed Description

The undelta class is used to store undo information in the work nodes. It is designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded.

10.277.2 Constructor & Destructor Documentation

10.277.2.1 coco::undelta::undelta (size_t *s*) [inline]

Standard Constructor

Definition at line 234 of file api_deltabase.h.

10.277.2.2 coco::undelta::undelta (undelta_base * *__d*, size_t *s*) [inline]

Internal Constructor, which just copies the pointer to the undelta_base. This pointer must be allocated by `new`, since it will be removed with `delete` in the destructor

Definition at line 238 of file api_deltabase.h.

10.277.2.3 coco::undelta::undelta (const undelta & *__d*)

Copy Constructor, which constructs a new undelta from an existing undelta. The clone operation for the undelta_base will be called in that process, effectively overloading the copy constructor for the undelta_base.

10.277.2.4 coco::undelta::~undelta ( )

Destructor, which frees the `_d` using `delete`

10.277.3 Member Function Documentation

10.277.3.1 size_t coco::undelta::delta_size ( ) const

Returns the size of the delta stored in the database

10.277.3.2 const undelta_base* coco::undelta::get_base ( ) const

Return the undelta_base stored in this wrapper

10.277.3.3 undelta& coco::undelta::operator= (const undelta & _u)

Assignment operator, which uses the clone operation for the undelta_base, effectively overloading the assignment operator for the undelta_base.

10.277.3.4 bool coco::undelta::unapply (work_node & _x, const delta_id & _i) const

Undo the delta with delta_id _i in work node _x

10.277.3.5 bool coco::undelta::unapply3 (work_node & _x, const work_node & _y, const delta_id & _i) const

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x.

The documentation for this class was generated from the following file:

- api_deltabase.h

10.278 coco::coco::undelta Class Reference

The undelta class (undo of updates to work nodes)

- size_t delta_size () const

10.278.1 Detailed Description

The undelta class is used to store undo information in the work nodes. It is designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded.

Definition at line 224 of file search_graph.cc.

10.278.2 Constructor & Destructor Documentation

10.278.2.1 coco::coco::undelta::undelta (size_t *s*) [inline]

Standard Constructor

Definition at line 234 of file search_graph.cc.

10.278.2.2 coco::coco::undelta::undelta (undelta_base * *__d*, size_t *s*) [inline]

Internal Constructor, which just copies the pointer to the undelta_base. This pointer must be allocated by `new`, since it will be removed with `delete` in the destructor

Definition at line 238 of file search_graph.cc.

10.278.2.3 coco::coco::undelta::undelta (const undelta & *__d*) [inline]

Copy Constructor, which constructs a new undelta from an existing undelta. The clone operation for the undelta_base will be called in that process, effectively overloading the copy constructor for the undelta_base.

Definition at line 199 of file api_delta.h.

10.278.2.4 coco::coco::undelta::~undelta ( ) [inline]

Destructor, which frees the `_d` using `delete`

Definition at line 206 of file api_delta.h.

10.278.2.5 coco::coco::undelta::undelta (size_t *s*) [inline]

Standard Constructor

Definition at line 234 of file search_graph.cc.

10.278.2.6 coco::coco::undelta::undelta (undelta_base * __d, size_t s) [inline]

Internal Constructor, which just copies the pointer to the undelta_base. This pointer must be allocated by `new`, since it will be removed with `delete` in the destructor

Definition at line 238 of file search_graph.cc.

10.278.2.7 coco::coco::undelta::undelta (const undelta & __d)

Copy Constructor, which constructs a new undelta from an existing undelta. The clone operation for the undelta_base will be called in that process, effectively overloading the copy constructor for the undelta_base.

10.278.2.8 coco::coco::undelta::~undelta ( )

Destructor, which frees the `_d` using `delete`

10.278.2.9 coco::coco::undelta::undelta (size_t s) [inline]

Standard Constructor

Definition at line 234 of file search_graph.cc.

10.278.2.10 coco::coco::undelta::undelta (undelta_base * __d, size_t s) [inline]

Internal Constructor, which just copies the pointer to the undelta_base. This pointer must be allocated by `new`, since it will be removed with `delete` in the destructor

Definition at line 238 of file search_graph.cc.

10.278.2.11 coco::coco::undelta::undelta (const undelta & __d)

Copy Constructor, which constructs a new undelta from an existing undelta. The clone operation for the undelta_base will be called in that process, effectively overloading the copy constructor for the undelta_base.

10.278.2.12 coco::coco::undelta::~undelta ( )

Destructor, which frees the `_d` using `delete`

10.278.3 Member Function Documentation

10.278.3.1 size_t coco::coco::undelta::delta_size ( ) const [inline]

Returns the size of the delta stored in the database

Definition at line 230 of file api_delta.h.

10.278.3.2 size_t coco::coco::undelta::delta_size ( ) const

Returns the size of the delta stored in the database

10.278.3.3 size_t coco::coco::undelta::delta_size ( ) const

Returns the size of the delta stored in the database

10.278.3.4 const undelta_base * coco::coco::undelta::get_base ( ) const [inline]

Return the undelta_base stored in this wrapper

Definition at line 221 of file api_delta.h.

10.278.3.5 const undelta_base* coco::coco::undelta::get_base ( ) const

Return the undelta_base stored in this wrapper

10.278.3.6 const undelta_base* coco::coco::undelta::get_base ( ) const

Return the undelta_base stored in this wrapper

10.278.3.7 undelta& coco::coco::undelta::operator= (const undelta & _u)

Assignment operator, which uses the clone operation for the undelta_base, effectively overloading the assignment operator for the undelta_base.

10.278.3.8 undelta & coco::coco::undelta::operator= (const undelta & _u) [inline]

Assignment operator, which uses the clone operation for the undelta_base, effectively overloading the assignment operator for the undelta_base.

Definition at line 212 of file api_delta.h.

10.278.3.9 undelta& coco::coco::undelta::operator= (const undelta & _u)

Assignment operator, which uses the clone operation for the undelta_base, effectively overloading the assignment operator for the undelta_base.

10.278.3.10 bool coco::coco::undelta::unapply (work_node & _x, const delta_id & _i) const

Undo the delta with delta_id _i in work node _x

10.278.3.11 bool coco::coco::undelta::unapply (work_node & _x, const delta_id & _i) const [inline]

Undo the delta with delta_id _i in work node _x

Definition at line 223 of file api_delta.h.

10.278.3.12 bool coco::coco::undelta::unapply (work_node & _x, const delta_id & _i) const

Undo the delta with delta_id _i in work node _x

10.278.3.13 bool coco::coco::undelta::unapply3 (work_node & _x, const work_node & _y, const delta_id & _i) const [inline]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x.

Definition at line 226 of file api_delta.h.

10.278.3.14 bool coco::coco::undelta::unapply3 (work_node & _x, const work_node & _y, const delta_id & _i) const

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x.

10.278.3.15 bool coco::coco::undelta::unapply3 (work_node & _x, const work_node & _y, const delta_id & _i) const

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x.

The documentation for this class was generated from the following files:

- api_deltabase.h
- api_delta.h

10.279 coco::undelta_base Class Reference

Base class for the undeltas.

`#include <api_deltabase.h>`

Public Member Functions

- undelta_base ()
- undelta_base (const undelta_base &__d)
- virtual undelta_base * new_copy () const PURE_VIRTUALvirtual void destroy_copy(undelta_base *__d) const PURE_VIRTUALvirtual~undelta_base()
- undelta make_undelta (size_t s)
- virtual bool unapply (work_node &_x, const delta_id &_d) const
- virtual bool unapply3 (work_node &_x, const work_node &_y, const delta_id &_d) const

10.279.1 Detailed Description

Base class for the undeltas, which is wrapped by the undelta class since copy constructors cannot directly be overloaded.

10.279.2 Constructor & Destructor Documentation

10.279.2.1 coco::undelta_base::undelta_base ( ) [inline]

Standard Constructor

Definition at line 276 of file api_deltabase.h.

10.279.2.2 coco::undelta_base::undelta_base (const undelta_base & __d) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 278 of file api_deltabase.h.

10.279.3 Member Function Documentation

10.279.3.1 undelta coco::undelta_base::make_undelta (size_t s) [inline]

Construct an undelta from this undelta_base.

Definition at line 289 of file api_deltabase.h.

10.279.3.2 virtual undelta_base* coco::undelta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Definition at line 281 of file api_deltabase.h.

10.279.3.3 virtual bool coco::undelta_base::unapply (work_node & _x, const delta_id & _d) const [inline, virtual]

Undo the delta with delta_id _i in work node _x

Definition at line 296 of file api_deltabase.h.

10.279.3.4 virtual bool coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

The documentation for this class was generated from the following file:

- api_deltabase.h

10.280.1 Detailed Description

Base class for the undeltas, which is wrapped by the undelta class since copy constructors cannot directly be overloaded.

Definition at line 272 of file search_graph.cc.

10.280.2 Constructor & Destructor Documentation

10.280.2.1 coco::coco::undelta_base::undelta_base ( ) [inline]

Standard Constructor

Definition at line 276 of file search_graph.cc.

10.280.2.2 coco::coco::undelta_base::undelta_base (const undelta_base & __d) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 278 of file search_graph.cc.

10.280.2.3 coco::coco::undelta_base::undelta_base ( ) [inline]

Standard Constructor

Definition at line 276 of file search_graph.cc.

10.280.2.4 coco::coco::undelta_base::undelta_base (const undelta_base & __d) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 278 of file search_graph.cc.

10.280.2.5 coco::coco::undelta_base::undelta_base ( ) [inline]

Standard Constructor

Definition at line 276 of file search_graph.cc.

10.280.2.6 coco::coco::undelta_base::undelta_base (const undelta_base & __d) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 278 of file search_graph.cc.

10.280.3 Member Function Documentation

10.280.3.1 undelta coco::coco::undelta_base::make_undelta (size_t s) [inline]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.280.3.2 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.280.3.3 undelta coco::coco::undelta_base::make_undelta (size_t *s*) [inline]

Construct an undelta from this undelta_base.

Definition at line 289 of file search_graph.cc.

10.280.3.4 virtual undelta_base* coco::coco::undelta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::split_undelta, and coco::infeasible_undelta.

Definition at line 281 of file search_graph.cc.

10.280.3.5 virtual undelta_base* coco::coco::undelta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::split_undelta, and coco::infeasible_undelta.

Definition at line 281 of file search_graph.cc.

10.280.3.6 virtual undelta_base* coco::coco::undelta_base::new_copy ( ) const [inline, virtual]

Clone Operation, which can be overloaded Clone Destructor Standard Destructor

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::split_undelta, and coco::infeasible_undelta.

Definition at line 281 of file search_graph.cc.

10.280.3.7 virtual bool coco::coco::undelta_base::unapply (work_node & *_x*, const delta_id & *_d*) const [inline, virtual]

Undo the delta with delta_id _i in work node _x

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::infeasible_undelta, and coco::split_undelta.

Definition at line 296 of file search_graph.cc.

10.280.3.8 virtual bool coco::coco::undelta_base::unapply (work_node & *_x*, const delta_id & *_d*) const [inline, virtual]

Undo the delta with delta_id _i in work node _x

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::infeasible_undelta, and coco::split_undelta.

Definition at line 296 of file search_graph.cc.

10.280.3.9 virtual bool coco::coco::undelta_base::unapply (work_node & _x, const delta_id & _d) const [inline, virtual]

Undo the delta with delta_id _i in work node _x

Reimplemented in coco::dag_undelta, coco::bound_undelta, coco::annotation_undelta, coco::semantics_-undelta, coco::infeasible_undelta, and coco::split_undelta.

Definition at line 296 of file search_graph.cc.

10.280.3.10 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

10.280.3.11 bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [inline, virtual]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

Definition at line 94 of file api_delta.h.

10.280.3.12 virtual bool coco::coco::undelta_base::unapply3 (work_node & _x, const work_node & _y, const delta_id & _d) const [virtual]

Undo the delta with delta_id _d in work node _x, constructing in the process work_node _y, without changing _x. This method should be overloaded in the specializations of this class for maximal efficiency, but it need not since a standard procedure is available, which uses the work_node copy constructur and the unapply method.

The documentation for this class was generated from the following files:

- api_deltabase.h
- api_delta.h

10.281 coco::coco::variable_indicator Class Reference

Bitmap class used to indicate variable occurrence.

Public Member Functions

- variable_indicator ()

- variable_indicator (int num_of_vars)
- variable_indicator (const std::vector< int > &__v, int num_of_vars)
- variable_indicator (const variable_indicator &__x)

- bool operator== (const variable_indicator &__v)
- std::vector< int > encode ()
- void decode (const std::vector< int > &__e)

10.281.1 Detailed Description

This class is a bitmap class, which is used to indicate which variables share a certain property. E.g., from which variables an expression depends, which variables have been changed since the last evaluation, and the like.

10.281.2 Constructor & Destructor Documentation

10.281.2.1 coco::coco::variable_indicator::variable_indicator ( ) [inline]

Standard Constructor

Definition at line 81 of file search_graph.cc.

10.281.2.2 coco::coco::variable_indicator::variable_indicator (int *num_of_vars*) [inline]

This is a constructor preparing for `num_of_vars` variables.

Definition at line 84 of file search_graph.cc.

10.281.2.3 coco::coco::variable_indicator::variable_indicator (const std::vector< int > & *__v*, int *num_of_vars*) [inline]

This is a constructor preparing for `num_of_vars` variables, which sets all those variables, whose number appears in `__v`.

Definition at line 88 of file search_graph.cc.

10.281.2.4 coco::coco::variable_indicator::variable_indicator (const variable_indicator & __x) [inline]

Standard Copy Constructor

Definition at line 96 of file search_graph.cc.

10.281.2.5 virtual coco::coco::variable_indicator::~variable_indicator ( ) [inline, virtual]

Standard Destructor

Definition at line 99 of file search_graph.cc.

10.281.3 Member Function Documentation

10.281.3.1 void coco::coco::variable_indicator::clear ( ) [inline]

The clear method unsets all variables in the variable_indicator

Definition at line 161 of file search_graph.cc.

10.281.3.2 void coco::coco::variable_indicator::decode (const std::vector< int > & __e) [inline]

This method decodes a variable_indicator from a vector<int>. This operation is the inversion of the encode method.

Definition at line 283 of file search_graph.cc.

10.281.3.3 std::vector<int> coco::coco::variable_indicator::encode ( ) [inline]

This method encodes a variable_indicator as a vector<int> so that it can be, e.g., stored in a basic_alltype.

Definition at line 272 of file search_graph.cc.

10.281.3.4 bool coco::coco::variable_indicator::match (const variable_indicator & __v) const [inline]

The match method compares this variable_indicator with the variable_indicator ___v. It returns if the two bitsets are disjoint.

Definition at line 243 of file search_graph.cc.

10.281.3.5 variable_indicator& coco::coco::variable_indicator::operator= (const variable_indicator & __v) [inline]

Standard Assignment Operator

Definition at line 258 of file search_graph.cc.

10.281.3.6 bool coco::coco::variable_indicator::operator== (const variable_indicator & __v) [inline]

Standard Comparison Operator

Definition at line 265 of file search_graph.cc.

10.281.3.7 void coco::coco::variable_indicator::reserve (int *num_of_vars*) [inline]

This method prepares enough memory that no reallocation is necessary, when num_of_vars have to be stored.

Definition at line 103 of file search_graph.cc.

10.281.3.8 void coco::coco::variable_indicator::set (int *__i*) [inline]

This method sets (sets the bit in the bitmap) the variable with number __i.

Definition at line 127 of file search_graph.cc.

10.281.3.9 void coco::coco::variable_indicator::set (std::vector< int > *__v*) [inline]

With this set method all the variables with numbers in __v can be set.

Definition at line 133 of file search_graph.cc.

10.281.3.10 void coco::coco::variable_indicator::set (int *start_idx*, int *end_idx*) [inline]

This method sets all variables with numbers in {[start_idx,end_idx[}.

Definition at line 141 of file search_graph.cc.

10.281.3.11 void coco::coco::variable_indicator::set_all (const variable_indicator & *_vi*) [inline]

The set_all method sets bits for all those variables (within the valid set of numbers, i.e. variable number < num_of_vars) which are set in _vi.

Definition at line 113 of file search_graph.cc.

10.281.3.12 unsigned int coco::coco::variable_indicator::sum (int *start_idx*, int *end_idx*) const [inline]

The sum method counts the number of variables which are set in the number range {[start_idx,end_idx[}.

Definition at line 205 of file search_graph.cc.

10.281.3.13 bool coco::coco::variable_indicator::test (int *__i*) const [inline]

This method returns whether the variable __i is set.

Definition at line 235 of file search_graph.cc.

10.281.3.14 void coco::coco::variable_indicator::unset (int *__i*) [inline]

This method unsets (clears the bit in the bitmap) the variable with number __i.

Definition at line 169 of file search_graph.cc.

10.281.3.15 void coco::coco::variable_indicator::unset (std::vector< int > *__v*) [inline]

With this unset method all the variables with numbers in __v can be unset.

Definition at line 176 of file search_graph.cc.

10.281.3.16 void coco::coco::variable_indicator::unset (int *start_idx*, int *end_idx*) [inline]

This method unsets all variables with numbers in {[start_idx,end_idx[}.

Definition at line 184 of file search_graph.cc.

The documentation for this class was generated from the following file:

- evaluator.h

10.282 coco::variable_indicator Class Reference

Bitmap class used to indicate variable occurrence.

`#include <evaluator.h>`

Public Member Functions

10.282.1 Detailed Description

This class is a bitmap class, which is used to indicate which variables share a certain property. E.g., from which variables an expression depends, which variables have been changed since the last evaluation, and the like.

10.282.2 Constructor & Destructor Documentation

10.282.2.1 coco::variable_indicator::variable_indicator ( ) [inline]

Standard Constructor

Definition at line 80 of file evaluator.h.

10.282.2.2 coco::variable_indicator::variable_indicator (int *num_of_vars*) [inline]

This is a constructor preparing for num_of_vars variables.

Definition at line 83 of file evaluator.h.

10.282.2.3 coco::variable_indicator::variable_indicator (const std::vector< int > & *__v*, int *num_of_vars*) [inline]

This is a constructor preparing for num_of_vars variables, which sets all those variables, whose number appears in __v.

Definition at line 87 of file evaluator.h.

10.282.2.4 coco::variable_indicator::variable_indicator (const variable_indicator & *__x*) [inline]

Standard Copy Constructor

Definition at line 95 of file evaluator.h.

10.282.2.5 virtual coco::variable_indicator::~variable_indicator ( ) [inline, virtual]

Standard Destructor

Definition at line 98 of file evaluator.h.

10.282.3 Member Function Documentation

10.282.3.1 void coco::variable_indicator::clear ( ) [inline]

The clear method unsets all variables in the variable_indicator

Definition at line 160 of file evaluator.h.

10.282.3.2 void coco::variable_indicator::decode (const std::vector< int > & *__e*) [inline]

This method decodes a variable_indicator from a vector<int>. This operation is the inversion of the encode method.

Definition at line 282 of file evaluator.h.

10.282.3.3 std::vector<int> coco::variable_indicator::encode ( ) [inline]

This method encodes a variable_indicator as a vector<int> so that it can be, e.g., stored in a basic_alltype.

Definition at line 271 of file evaluator.h.

10.282.3.4 bool coco::variable_indicator::match (const variable_indicator & __v) const [inline]

The match method compares this variable_indicator with the variable_indicator ___v. It returns if the two bitsets are disjoint.

Definition at line 242 of file evaluator.h.

10.282.3.5 variable_indicator& coco::variable_indicator::operator= (const variable_indicator & __v) [inline]

Standard Assignment Operator

Definition at line 257 of file evaluator.h.

10.282.3.6 bool coco::variable_indicator::operator== (const variable_indicator & __v) [inline]

Standard Comparison Operator

Definition at line 264 of file evaluator.h.

10.282.3.7 void coco::variable_indicator::reserve (int *num_of_vars*) [inline]

This method prepares enough memory that no reallocation is necessary, when num_of_vars have to be stored.

Definition at line 102 of file evaluator.h.

10.282.3.8 void coco::variable_indicator::set (int __i) [inline]

This method sets (sets the bit in the bitmap) the variable with number ___i.

Definition at line 126 of file evaluator.h.

10.282.3.9 void coco::variable_indicator::set (std::vector< int > __v) [inline]

With this set method all the variables with numbers in ___v can be set.

Definition at line 132 of file evaluator.h.

10.282.3.10 void coco::variable_indicator::set (int *start_idx*, int *end_idx*) [inline]

This method sets all variables with numbers in {[start_idx,end_idx[}.

Definition at line 140 of file evaluator.h.

10.282.3.11 void coco::variable_indicator::set_all (const variable_indicator & _vi) [inline]

The set_all method sets bits for all those variables (within the valid set of numbers, i.e. variable number < num_of_vars) which are set in _vi.

Definition at line 112 of file evaluator.h.

10.282.3.12 unsigned int coco::variable_indicator::sum (int *start_idx*, int *end_idx*) const [inline]

The sum method counts the number of variables which are set in the number range {[start_idx,end_idx[}.

Definition at line 204 of file evaluator.h.

10.282.3.13 bool coco::variable_indicator::test (int *__i*) const [inline]

This method returns whether the variable ___i is set.

Definition at line 234 of file evaluator.h.

10.282.3.14 void coco::variable_indicator::unset (int *__i*) [inline]

This method unsets (clears the bit in the bitmap) the variable with number ___i.

Definition at line 168 of file evaluator.h.

10.282.3.15 void coco::variable_indicator::unset (std::vector< int > *__v*) [inline]

With this unset method all the variables with numbers in ___v can be unset.

Definition at line 175 of file evaluator.h.

10.282.3.16 void coco::variable_indicator::unset (int *start_idx*, int *end_idx*) [inline]

This method unsets all variables with numbers in {[start_idx,end_idx[}.

Definition at line 183 of file evaluator.h.

The documentation for this class was generated from the following file:

- evaluator.h

- search_node_id node_id (const work_node &wn) const

10.283.1 Detailed Description

This class is a work node computation hook (see work_node_comp_hook), which calculates the volume of the work node (from the bound constraints) and keeps it in column "vol".

10.283.2 Constructor & Destructor Documentation

10.283.2.1 coco::vol_comp_hook::vol_comp_hook ( ) [inline]

Standard Constructor

Definition at line 46 of file vol_hook.h.

10.283.2.2 virtual coco::vol_comp_hook::~vol_comp_hook ( ) [inline, virtual]

Standard Destructor

Definition at line 49 of file vol_hook.h.

10.283.3 Member Function Documentation

10.283.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected, inherited]

Remove all columns, whose identifiers are stored in __managed_cols from table stable.

Definition at line 34 of file comp_hook.cc.

10.283.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 238 of file comp_hook.h.

10.283.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected, inherited]

Add a column of type _CI with name colname to the table stable. The column is stored in __managed_cols.

Definition at line 135 of file comp_hook.h.

10.283.3.4 bool coco::vol_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon unregistering this hook, destroy the column "vol" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 90 of file vol_hook.h.

10.283.3.5 bool coco::vol_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column "vol" in the "search info" table.

Reimplemented from coco::wnc_hook_base.

Definition at line 85 of file vol_hook.h.

10.283.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline, inherited]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.283.3.7 vol_comp_hook* coco::vol_comp_hook::new_copy ( ) const [inline, virtual]

Clone Operation

Implements coco::wnc_hook_base.

Definition at line 52 of file vol_hook.h.

10.283.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_id of work_node `wn`.

Definition at line 43 of file comp_hook.cc.

10.283.3.9 void coco::vol_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *a* = NULL, std::list< certificate > * *b* = NULL) const [inline, virtual]

The evaluation operator of this computation hook. It stores the volume of the work_node `wn` in dbt_row `dbr`.

Implements coco::wnc_hook_base.

Definition at line 56 of file vol_hook.h.

10.283.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected, inherited]

This method is an accessor to the search_node_relation of work_node `wn`.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following file:

- vol_hook.h

10.284 coco::wnc_hook_base Class Reference

Base class for the work node computation hooks.

`#include <comp_hook.h>`

10.284.1 Detailed Description

Base class for the work node computation hooks, which is wrapped by the work_node_comp_hook class since copy constructors cannot directly be overloaded.

10.284.2 Constructor & Destructor Documentation

10.284.2.1 coco::wnc_hook_base::wnc_hook_base ( ) [inline]

Standard Constructor

Definition at line 153 of file comp_hook.h.

10.284.2.2 coco::wnc_hook_base::wnc_hook_base (const std::string & *name*) [inline]

Constructor setting the identifier string of this hook to `name`

Definition at line 155 of file comp_hook.h.

10.284.2.3 coco::wnc_hook_base::wnc_hook_base (const char * *name*) [inline]

Constructor setting the identifier string of this hook to `name`

Definition at line 157 of file comp_hook.h.

10.284.2.4 coco::wnc_hook_base::wnc_hook_base (const wnc_hook_base & *w*) [inline]

Standard Copy Constructor, which is usually not used.

Definition at line 159 of file comp_hook.h.

10.284.2.5 virtual coco::wnc_hook_base::~wnc_hook_base ( ) [inline, virtual]

Standard Destructor

Definition at line 163 of file comp_hook.h.

10.284.3 Member Function Documentation

10.284.3.1 bool coco::wnc_hook_base::_drop_columns (vdbl::standard_table & *stable*) [protected]

Remove all columns, whose identifiers are stored in `__managed_cols` from table `stable`.

Definition at line 34 of file comp_hook.cc.

10.284.3.2 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const std::string & *colname*, const _CI & *c*) [protected]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 238 of file comp_hook.h.

10.284.3.3 template<class _CI > bool coco::wnc_hook_base::_init_column (vdbl::standard_table & *stable*, const char * *colname*, const _CI & *c*) [inline, protected]

Add a column of type _CI with name colname to the table stable. The column is stored in ___managed_cols.

Definition at line 135 of file comp_hook.h.

10.284.3.4 virtual bool coco::wnc_hook_base::drop_columns (vdbl::standard_table & *stable*) [inline, virtual]

Remove all columns, whose identifiers are stored in ___managed_cols from table stable. If columns are used, a call to _drop_columns is needed in an overloaded version of this method.

Reimplemented in coco::inference_engine_comp_hook, coco::objbounds_comp_hook, coco::pending_status_comp_hook, coco::vol_comp_hook, coco::diameter_comp_hook, coco::pfstar_hook, coco::memory_comp_hook, and coco::logvol_comp_hook.

Definition at line 187 of file comp_hook.h.

10.284.3.5 virtual bool coco::wnc_hook_base::init_columns (vdbl::standard_table & *stable*) [inline, virtual]

Upon registering this hook, initialize the column(s) in the "search info" table in which the result(s) of this hook are stored. It must be overloaded if columns are needed. In that case, the _init_column method should be used.

Reimplemented in coco::inference_engine_comp_hook, coco::objbounds_comp_hook, coco::pending_status_comp_hook, coco::vol_comp_hook, coco::diameter_comp_hook, coco::memory_comp_hook, coco::logvol_comp_hook, and coco::pfstar_hook.

Definition at line 182 of file comp_hook.h.

10.284.3.6 const std::string& coco::wnc_hook_base::name ( ) const [inline]

Return the identifier string of this work node computation hook.

Definition at line 190 of file comp_hook.h.

10.284.3.7 virtual wnc_hook_base* coco::wnc_hook_base::new_copy ( ) const [pure virtual]

Clone Operation, which must be overloaded

Implemented in coco::inference_engine_comp_hook, coco::objbounds_comp_hook, coco::pfstar_hook, coco::pending_status_comp_hook, coco::diameter_comp_hook, coco::logvol_comp_hook, coco::memory_comp_hook, and coco::vol_comp_hook.

10.284.3.8 search_node_id coco::wnc_hook_base::node_id (const work_node & *wn*) const [protected]

This method is an accessor to the search_node_id of work_node wn.

Definition at line 43 of file comp_hook.cc.

10.284.3.9 virtual void coco::wnc_hook_base::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *add_ds*, std::list< certificate > * *add_cs*) const [pure virtual]

The evaluation operator of this computation hook. It stores the result of the hook applied to work_node wn in dbt_row dbr, which in return is stored in the "search info" table of the search database. The hook can compute additional deltas and add them to add_ds, which are applied to the work node during the split. It must be overloaded.

Implemented in coco::inference_engine_comp_hook, coco::objbounds_comp_hook, coco::pending_status_comp_hook, coco::pfstar_hook, coco::diameter_comp_hook, coco::logvol_comp_hook, coco::memory_comp_hook, and coco::vol_comp_hook.

10.284.3.10 search_node_relation coco::wnc_hook_base::parent_relation (const work_node & *wn*) const [protected]

This method is an accessor to the search_node_relation of work_node wn.

Definition at line 46 of file comp_hook.cc.

The documentation for this class was generated from the following files:

- comp_hook.h
- comp_hook.cc

10.285 coco::work_node Class Reference

Work node, which is passed to the inference engines.

Methods for accessing model parts

The methods of this section are used to extract or access parts of the model with specific properties, e.g., extract the linear part of the model, access only the polynomial constraints,... In all these methods the type of the expressions is specified using type values from e_expression_type and their combination.

See also

e_expression_type

- model get (unsigned int __type)
  Retrieve a subpart of a model.
- constraint_const_iterator get_begin (unsigned int __type) const
  Get an iterator to (read only) access constraints of a specified type.
- constraint_const_iterator get_end (unsigned int __type) const
  Get an iterator pointing past the constraints of a specified type.
- constraint_iterator get_begin (unsigned int __type)
  Get an iterator to access constraints of a specified type.
- constraint_iterator get_end (unsigned int __type)
  Get an iterator pointing past the constraints of a specified type.
- unsigned int n (unsigned int __type) const

- class search_graph

10.285.1 Detailed Description

This is class of nodes, an enhanced full node, which is constructed, whenever a search focus is set to a specific search node in the search graph. It stores a complete model along with all annotations, a fair amount of additional information (including some caches) and the undelta information for all deltas, which had to be applied to construct that work node from the closest full node ancestor in the search graph.

10.285.2 Member Typedef Documentation

10.285.2.1 typedef constraint_iterator_base<expression_walker, const std::vector<expression_walker>*, const std::vector<expression_walker>&,const expression_walker*, const expression_walker&, std::vector<expression_walker>::const_iterator> coco::work_node::constraint_const_iterator

This type defines a special const iterator, which iterates through all constraints of a specified type.

See also

get_begin

Definition at line 418 of file search_node.h.

10.285.2.2 typedef constraint_iterator_base<expression_walker, std::vector<expression_walker>*, std::vector<expression_walker>&,expression_walker*,expression_walker&, std::vector<expression_walker>::iterator> coco::work_node::constraint_iterator

This type defines a special iterator, which iterates through all constraints of a specified type.

See also

get_begin

Definition at line 432 of file search_node.h.

10.285.2.3 typedef uint32_t coco::work_node::transaction_number

The transaction numbers are used for keeping track of split deltas, whose contents are stored in the proposed_splits member locally in the work node.

Definition at line 508 of file search_node.h.

10.285.3 Constructor & Destructor Documentation

10.285.3.1 coco::work_node::work_node (const work_node & __w)

Standard Copy Constructor

10.285.3.2 coco::work_node::work_node (const full_node & __f, const std::list< delta_id > & __de, vdbl::viewdbase * vdbf = NULL)

Expansion Constructor from full_node

10.285.3.3 coco::work_node::work_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __m, gptr< vdbl::database > & __d, const std::vector< annotation > & __an, const std::list< delta_id > & __de, gptr< search_node > * _gm, search_node_relation snr = snr_worknode, vdbl::viewdbase * vdbf = NULL)

This constructor generates a new work node (a standalone worknode by default) with search_node_id i and search_node_relation __snr. The parameter __m is used to specify the full model, while the parameters _gm, __d, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by parameter __an, and the list of delta ids is set to __de.

10.285.3.4 virtual coco::work_node::~work_node ( ) [virtual]

Standard Destructor

10.285.4 Member Function Documentation

10.285.4.1 double coco::work_node::compute_log_volume (const std::vector< interval > & _r) const

This method computes a finite approximation to the logarithmic volume of the box determined by the range vector _r. Note that _r is a range vector, i.e. it contains a range for every node in the DAG and is indexed by node numbers and not by variable numbers.

10.285.4.2 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.285.4.3 double coco::work_node::gain ( ) const [inline]

This method returns the current gain_factor of the work_node.

Definition at line 757 of file search_node.h.

10.285.4.4 model coco::work_node::get (unsigned int __type) [inline]

The get function returns a subpart of the model, which only consists of objective function and constraints of the specified type ___type. usage e.g.:

```
get(ex_bounds|ex_linear|ex_quadratic)
```

for a full quadratic model, equivalent:

```
get(ex_atmquad)
```

Bug The get function is not yet properly implemented.

Definition at line 655 of file search_node.h.

10.285.4.5 const annotation& coco::coco::full_node::get_annotation (unsigned int *i*) const [inline, inherited]

A call to this method returns a const reference to the ith annotation.

Definition at line 362 of file search_graph.cc.

10.285.4.6 const std::vector<annotation>& coco::coco::full_node::get_annotations ( ) const [inline, inherited]

A call to this method returns a const reference to the whole vector of annotations.

Definition at line 367 of file search_graph.cc.

10.285.4.7 constraint_const_iterator coco::work_node::get_begin (unsigned int __type) const

The get_begin() function returns a constraint_const_iterator pointing to the first constraint of type ___type. The iterator then can be used to iterate through all such constraints. Usage e.g.:

```
constraint_const_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something_const(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

10.285.4.8 constraint_iterator coco::work_node::get_begin (unsigned int __type)

The get_begin() function returns a constraint_iterator pointing to the first constraint of type ___type. The iterator then can be used to iterate through all such constraints. Usage e.g.:

```
constraint_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

10.285.4.9 certificate coco::work_node::get_certificate (const delta_id & *_id*)

This method returns the certificate associated to the delta with delta_id _id.

10.285.4.10 const certificate& coco::work_node::get_certificate (const delta_id & *_id*) const

This method returns a const reference to the certificate associated to the delta with delta_id _id.

10.285.4.11 const vdbl::database* coco::coco::full_node::get_database ( ) const [inline, inherited]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 378 of file search_graph.cc.

10.285.4.12 vdbl::database* coco::coco::full_node::get_database_ptr ( ) const [inline, inherited]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 389 of file search_graph.cc.

10.285.4.13 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.285.4.14 delta coco::work_node::get_delta (const delta_id & *_id*)

This method returns the delta with delta_id _id.

10.285.4.15 const delta& coco::work_node::get_delta (const delta_id & *_id*) const

This method returns a const reference to the delta with delta_id _id.

10.285.4.16 constraint_const_iterator coco::work_node::get_end (unsigned int *__type*) const

The get_end() function returns a constraint_const_iterator pointing after the last constraint of type __type. The iterator then can be used to stop the iterating process through all such constraints at the end. Usage e.g.:

```
constraint_const_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something_const(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

10.285.4.17 constraint_iterator coco::work_node::get_end (unsigned int *__type*)

The get_end() function returns a constraint_iterator pointing after the last constraint of type __type. The iterator then can be used to stop the iterating process through all such constraints at the end. Usage e.g.:

```
constraint_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

10.285.4.18 vdbl::viewdbase& coco::work_node::get_fullviewdbase ( ) [inline]

This method returns the actual full view database.

Definition at line 629 of file search_node.h.

10.285.4.19 const vdbl::viewdbase& coco::work_node::get_fullviewdbase ( ) const [inline]

This method returns the actual full view database.

Definition at line 632 of file search_node.h.

10.285.4.20 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.285.4.21 inference_module_cache& coco::work_node::get_inf_mod_cache ( ) [inline]

This method returns the inference module cache for this work node

Definition at line 635 of file search_node.h.

10.285.4.22 const model* coco::work_node::get_model ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Reimplemented from coco::coco::full_node.

Definition at line 609 of file search_node.h.

10.285.4.23 model* coco::work_node::get_model ( ) [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 613 of file search_node.h.

10.285.4.24 model* coco::coco::full_node::get_model_ptr ( ) const [inline, inherited]

This method returns a pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 383 of file search_graph.cc.

10.285.4.25 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.285.4.26 transaction_number coco::work_node::get_transaction_number ( ) [inline]

This method returns a unique transaction number for split deltas.

Definition at line 518 of file search_node.h.

10.285.4.27 vdbl::viewdbase& coco::work_node::get_viewdbase ( ) [inline]

This method returns the actual view database.

Definition at line 623 of file search_node.h.

10.285.4.28 const vdbl::viewdbase& coco::work_node::get_viewdbase ( ) const [inline]

This method returns the actual view database.

Definition at line 626 of file search_node.h.

10.285.4.29 work_node_context* coco::work_node::get_work_node_context ( ) [inline]

This method returns the actual work node context

Definition at line 617 of file search_node.h.

10.285.4.30 const work_node_context* coco::work_node::get_work_node_context ( ) const [inline]

This method returns the actual work node context

Definition at line 620 of file search_node.h.

10.285.4.31 const datamap& coco::work_node::global_info ( ) const [inline]

This method returns the global data used by the algorithm. See `globalinfo`.

Definition at line 760 of file search_node.h.

10.285.4.32 bool coco::work_node::global_info (basic_alltype & *b*, const std::string & *i*) const

This method returns the entry with name `i` in the global data used by the algorithm, setting `b`. It returns whether extraction was successful. See `globalinfo`.

10.285.4.33 bool coco::work_node::global_info (basic_alltype & *b*, const char * *i*) const [inline]

This method returns the entry with name `i` in the global data used by the algorithm, setting `b`. It returns whether extraction was successful. See `globalinfo`.

Definition at line 767 of file search_node.h.

10.285.4.34 basic_alltype coco::work_node::global_info (const std::string & *i*) const

This method returns the entry with name `i` in the global data used by the algorithm. See `globalinfo`.

10.285.4.35 basic_alltype coco::work_node::global_info (const char * *i*) const [inline]

This method returns the entry with name `i` in the global data used by the algorithm. See `globalinfo`.

Definition at line 774 of file search_node.h.

10.285.4.36 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.285.4.37 void coco::work_node::init_cnumbers ( )

This method computes the cache values n_bds, n_lin, n_quad, n_poly, and n_other and the log volume.

10.285.4.38 bool coco::coco::full_node::is_delta ( ) const [inline, virtual, inherited]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a full_node it returns `false`.

Reimplemented from coco::coco::search_node.

Definition at line 354 of file search_graph.cc.

10.285.4.39 void coco::coco::search_node::keep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation `_an`.

Definition at line 173 of file search_graph.cc.

10.285.4.40 void coco::coco::search_node::keep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in `_anv`.

Definition at line 177 of file search_graph.cc.

10.285.4.41 double coco::work_node::log_volume ( ) const [inline]

This method returns the finite approximation to the logarithmic volume of the work_node.

See also

log_vol

Definition at line 754 of file search_node.h.

10.285.4.42 void coco::work_node::make_node_order ( )

A call to this method recalculates the node_order for the model DAG stored in the work node.

10.285.4.43 void coco::work_node::make_node_ranges (bool *keep_old_ranges*)

A call to this method adapts the node_ranges vector to the .

10.285.4.44 unsigned int coco::work_node::n (unsigned int *__type*) const

This method returns the number of constraints of type `__type`. Usage, e.g.:

```
n(ex_linear|ex_equality)
```

returns the number of linear equality constraints.

10.285.4.45 unsigned int coco::coco::full_node::n_annotations ( ) const [inline, inherited]

This method returns the number of annotations stored in this full node.

Definition at line 358 of file search_graph.cc.

10.285.4.46 work_node& coco::work_node::operator= (const work_node & *__w*)

Standard Assignment Operator

10.285.4.47 work_node& coco::work_node::operator= (const full_node & *__f*)

Special Assignment Operator --- be careful when using it!

Reimplemented from coco::coco::full_node.

10.285.4.48 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.285.4.49 double coco::work_node::reset_gain ( ) [inline]

This method returns the current gain_factor of the work_node and resets it to 1.

Definition at line 779 of file search_node.h.

10.285.4.50 void coco::work_node::reset_node_ranges ( )

This method resets all unused node ranges to $[-\infty, \infty]$.

10.285.4.51 void coco::work_node::set_globalinfo ( )

This method extracts the information from the "global info" table and stores it in the `globalinfo` cache of the work_node.

10.285.4.52 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.285.4.53 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.285.4.54 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation _an.

Definition at line 82 of file search_node.hpp.

10.285.4.55 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in _anv.

Definition at line 93 of file search_node.hpp.

10.285.5 Friends And Related Function Documentation

10.285.5.1 friend class certificate [friend]

Definition at line 808 of file search_node.h.

10.285.5.2 friend class certificate_base [friend, inherited]

Definition at line 393 of file search_graph.cc.

10.285.5.3 friend class dag_delta [friend, inherited]

Definition at line 394 of file search_graph.cc.

10.285.5.4 friend class dag_undelta [friend, inherited]

Definition at line 395 of file search_graph.cc.

10.285.5.5 friend class delta [friend]

Definition at line 806 of file search_node.h.

10.285.5.6 friend class delta_base [friend, inherited]

Definition at line 392 of file search_graph.cc.

10.285.5.7 work_node operator+ (const work_node & _w, const delta_id & _d) [friend]

This function adds the delta with delta_id _i to work_node _w and returns a new work_node having the delta applied.

Definition at line 298 of file search_node.hpp.

10.285.5.8 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node operator+ (const work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function adds all the deltas whose delta_ids are in the linear container _d to work_node _w and returns a new work_node having all these deltas applied.

Definition at line 325 of file search_node.hpp.

10.285.5.9 work_node& operator+= (work_node & _w, const delta_id & _d) [friend]

This function adds the delta with delta_id _i to work_node _w changing it in that process. The function returns _w.

Definition at line 311 of file search_node.hpp.

10.285.5.10 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node& operator+= (work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function adds the deltas whose delta_ids are in the linear container _d to work_node _w changing it in that process. The function returns _w.

Definition at line 341 of file search_node.hpp.

10.285.5.11 work_node operator- (const work_node & _w, const delta_id & _d) [friend]

This function removes the delta with delta_id _i from work_node _w and returns a new work_node having the delta unapplied.

Definition at line 39 of file search_node.cc.

10.285.5.12 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node operator- (const work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function removes all the deltas whose delta_ids are in the linear container _d from work_node _w and returns a new work_node having all these deltas unapplied.

Definition at line 365 of file search_node.hpp.

10.285.5.13 work_node& operator-= (work_node & _w, const delta_id & _d) [friend]

This function removes (unapplies) the delta with delta_id _i from work_node _w changing it in that process. The function returns _w.

Definition at line 80 of file search_node.cc.

10.285.5.14 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node& operator-= (work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function removes (unapplies) the deltas whose delta_ids are in the linear container _d from work_node _w changing it in that process. The function returns _w.

Definition at line 383 of file search_node.hpp.

10.285.5.15 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.285.5.16 friend class undelta [friend]

Definition at line 807 of file search_node.h.

10.285.5.17 friend class wnc_hook_base [friend]

Definition at line 809 of file search_node.h.

10.285.6 Member Data Documentation

10.285.6.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.285.6.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.285.6.3 vdbl::viewdbase* coco::work_node::__vdb

This is a restricted view to the search database to be used by the inference engines and report modules.

Definition at line 471 of file search_node.h.

10.285.6.4 vdbl::viewdbase* coco::work_node::__vdbf

This is a full view to the search database to be used by the inference engines and report modules.

Definition at line 474 of file search_node.h.

10.285.6.5 std::vector<annotation> coco::coco::full_node::_ann [inherited]

This is the vector of annotations active at this full node.

Definition at line 283 of file search_graph.cc.

10.285.6.6 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.285.6.7 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.285.6.8 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.285.6.9 gptr<model>* coco::coco::full_node::_m [protected, inherited]

This is a pointer to a global pointer to the model kept in this full node.

Definition at line 279 of file search_graph.cc.

10.285.6.10 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.285.6.11 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

10.285.6.12 std::list<delta_id>::iterator coco::work_node::deltanew_it

This iterator points to the first 'new' delta of the work_node.

Definition at line 443 of file search_node.h.

10.285.6.13 std::list<delta_id> coco::work_node::deltas

This is the list of all deltas, which had to be applied to construct the given work_node. This includes the deltas necessary to extract the search_node to the work_node from the graph, as well as the "new" deltas, which have been applied by the solution strategy while the work node was analyzed by various inference engines.

Definition at line 440 of file search_node.h.

10.285.6.14 vdbl::standard_table* coco::work_node::dtable

This is a pointer to the "deltas" table in the search database.

Definition at line 456 of file search_node.h.

10.285.6.15 vdbl::tableid coco::work_node::dtable_id

This is the table identifier of the "deltas" table in the search database.

Definition at line 459 of file search_node.h.

10.285.6.16 double coco::work_node::gain_factor

This member keeps an improvement factor (in [0,1]) in bounds sizes since it was last reset.

Definition at line 499 of file search_node.h.

10.285.6.17 vdbl::standard_table* coco::work_node::gitable

This is a pointer to the "global info" table in the search database.

Definition at line 461 of file search_node.h.

10.285.6.18 vdbl::tableid coco::work_node::gitable_id

This is the table identifier of the "global info" table in the search database.

Definition at line 464 of file search_node.h.

10.285.6.19 datamap coco::work_node::globalinfo

This member keeps a cache of the global data used in the algorithm

Definition at line 501 of file search_node.h.

10.285.6.20 bool coco::work_node::infeasible

This boolean specifies, whether the problem represented by this work node is known to be infeasible.

Definition at line 492 of file search_node.h.

10.285.6.21 double coco::work_node::log_vol

This member keeps a finite approximation to the logarithmic volume of the box formed by the variable bounds of the original variables.

Definition at line 496 of file search_node.h.

10.285.6.22 std::vector<unsigned int> coco::work_node::node_order

The node_order vector provides a linear order on the DAG nodes, which is compatible with the DAG structure, i.e., all ancestors of a node are ordered after the node. The vector contains the order as a sequence node numbers of the DAG nodes.

Definition at line 489 of file search_node.h.

10.285.6.23 std::vector<interval> coco::work_node::node_ranges

The node_ranges vector keeps the current best known ranges of all nodes in the model DAG. The vector is indexed by the node numbers of the DAG nodes.

Definition at line 484 of file search_node.h.

10.285.6.24 std::set<search_node_id> coco::work_node::parents_in_graph

This parameter stores the parents of the work node in the graph

Definition at line 450 of file search_node.h.

10.285.6.25 std::map<transaction_number,std::list<std::vector<delta> > > coco::work_node::proposed_splits

This member stores all splits which have been proposed by the various inference engines that can be used to calculate possible splits. Every proposed split (being associated with a split_delta) gets assigned a unique transaction number. This is later used for unapplying the split_delta if necessary. Every split is itself a list of vectors of deltas. Every vector of deltas in the list is associated with one child node generated by the split, and the vector of deltas contains all deltas which have to be applied to the work node for constructing the respective child node from the work node.

Definition at line 531 of file search_node.h.

10.285.6.26 std::map<delta_id, transaction_number> coco::work_node::split_delta_ids

This map connects split_delta delta identifiers with transaction numbers in the proposed_splits map.

Definition at line 534 of file search_node.h.

10.285.6.27 std::list<delta_id>::iterator coco::work_node::splithook_deltanew_it

This iterator points to the first 'new' delta of the work_node generated due to splits and hooks.

Definition at line 447 of file search_node.h.

10.285.6.28 std::map<delta_id,undelta> coco::work_node::undeltas

This map connects delta identifiers of previously applied deltas with their corresponding undelta information.

See also

undelta

Definition at line 454 of file search_node.h.

10.285.6.29 work_node_context* coco::work_node::wnc

This is the work node context corresponding to the current work node.

Definition at line 468 of file search_node.h.

The documentation for this class was generated from the following file:

- search_node.h

10.286 coco::coco::work_node Class Reference

Work node, which is passed to the inference engines.

Methods for accessing model parts

The methods of this section are used to extract or access parts of the model with specific properties, e.g., extract the linear part of the model, access only the polynomial constraints,... In all these methods the type of the expressions is specified using type values from e_expression_type and their combination.

See also

e_expression_type

- model get (unsigned int __type)
  Retrieve a subpart of a model.
- constraint_const_iterator get_begin (unsigned int __type) const
  Get an iterator to (read only) access constraints of a specified type.
- constraint_const_iterator get_end (unsigned int __type) const
  Get an iterator pointing past the constraints of a specified type.
- constraint_iterator get_begin (unsigned int __type)
  Get an iterator to access constraints of a specified type.
- constraint_iterator get_end (unsigned int __type)
  Get an iterator pointing past the constraints of a specified type.

10.286.1 Detailed Description

This is class of nodes, an enhanced full node, which is constructed, whenever a search focus is set to a specific search node in the search graph. It stores a complete model along with all annotations, a fair amount of additional information (including some caches) and the undelta information for all deltas, which had to be applied to construct that work node from the closest full node ancestor in the search graph.

10.286.2 Member Typedef Documentation

10.286.2.1 typedef constraint_iterator_base<expression_walker, const std::vector<expression_walker>*, const std::vector<expression_walker>&,const expression_walker*, const expression_walker&, std::vector<expression_walker>::const_iterator> coco::coco::work_node::constraint_const_iterator

This type defines a special const iterator, which iterates through all constraints of a specified type.

See also

get_begin

Definition at line 418 of file search_graph.cc.

10.286.2.2 typedef constraint_iterator_base<expression_walker, std::vector<expression_walker>*, std::vector<expression_walker>&,expression_walker*,expression_walker&, std::vector<expression_walker>::iterator> coco::coco::work_node::constraint_iterator

This type defines a special iterator, which iterates through all constraints of a specified type.

See also

get_begin

Definition at line 432 of file search_graph.cc.

10.286.2.3 typedef uint32_t coco::coco::work_node::transaction_number

The transaction numbers are used for keeping track of split deltas, whose contents are stored in the proposed_splits member locally in the work node.

Definition at line 508 of file search_graph.cc.

10.286.3 Constructor & Destructor Documentation

10.286.3.1 coco::work_node::work_node (const work_node & __w) [inline]

Standard Copy Constructor

Definition at line 100 of file search_node.hpp.

10.286.3.2 coco::work_node::work_node (const full_node & __f, const std::list< delta_id > & __de, vdbl::viewdbase * vdbf = NULL)

Expansion Constructor from full_node

Definition at line 202 of file search_node.cc.

10.286.3.3 coco::work_node::work_node (const search_node_id & _i, const vdbl::userid & _dui, gptr< model > & __m, gptr< vdbl::database > & __d, const std::vector< annotation > & __an, const std::list< delta_id > & __de, gptr< search_node > * _gm, search_node_relation snr = snr_worknode, vdbl::viewdbase * vdbf = NULL)

This constructor generates a new work node (a standalone worknode by default) with search_node_id i and search_node_relation __snr. The parameter __m is used to specify the full model, while the parameters _gm, __d, and _dui initialize the global model, search database, and the database user id, respectively. The vector of annotations is initialized by parameter __an, and the list of delta ids is set to __de.

Definition at line 168 of file search_node.cc.

10.286.3.4 coco::work_node::~work_node ( ) [inline, virtual]

Standard Destructor

Definition at line 136 of file search_node.hpp.

10.286.4 Member Function Documentation

10.286.4.1 double coco::work_node::compute_log_volume (const std::vector< interval > & _r) const

This method computes a finite approximation to the logarithmic volume of the box determined by the range vector _r. Note that _r is a range vector, i.e. it contains a range for every node in the DAG and is indexed by node numbers and not by variable numbers.

Definition at line 285 of file search_node.cc.

10.286.4.2 gptr<vdbl::database>* coco::coco::search_node::database ( ) const [inline, inherited]

This is the accessor method for the search database.

Definition at line 157 of file search_graph.cc.

10.286.4.3 double coco::coco::work_node::gain ( ) const [inline]

This method returns the current gain_factor of the work_node.

Definition at line 757 of file search_graph.cc.

10.286.4.4 model coco::coco::work_node::get (unsigned int *__type*) [inline]

The get function returns a subpart of the model, which only consists of objective function and constraints of the specified type ___type. usage e.g.:

```
get(ex_bounds|ex_linear|ex_quadratic)
```

for a full quadratic model, equivalent:

```
get(ex_atmquad)
```

Bug The get function is not yet properly implemented.

Definition at line 655 of file search_graph.cc.

10.286.4.5 const annotation& coco::coco::full_node::get_annotation (unsigned int *i*) const [inline, inherited]

A call to this method returns a const reference to the ith annotation.

Definition at line 362 of file search_graph.cc.

10.286.4.6 const std::vector<annotation>& coco::coco::full_node::get_annotations ( ) const [inline, inherited]

A call to this method returns a const reference to the whole vector of annotations.

Definition at line 367 of file search_graph.cc.

10.286.4.7 work_node::constraint_const_iterator coco::work_node::get_begin (unsigned int *__type*) const [inline]

The get_begin() function returns a constraint_const_iterator pointing to the first constraint of type ___type. The iterator then can be used to iterate through all such constraints. Usage e.g.:

```
constraint_const_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something_const(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

Definition at line 139 of file search_node.hpp.

10.286.4.8 work_node::constraint_iterator coco::work_node::get_begin (unsigned int *__type*) [inline]

The get_begin() function returns a constraint_iterator pointing to the first constraint of type ___type. The iterator then can be used to iterate through all such constraints. Usage e.g.:

```
constraint_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

Definition at line 154 of file search_node.hpp.

10.286.4.9 certificate coco::work_node::get_certificate (const delta_id & *_id*) [inline]

This method returns the certificate associated to the delta with delta_id _id.

Definition at line 460 of file search_node.hpp.

10.286.4.10 const certificate & coco::work_node::get_certificate (const delta_id & *_id*) const [inline]

This method returns a const reference to the certificate associated to the delta with delta_id _id.

Definition at line 484 of file search_node.hpp.

10.286.4.11 const vdbl::database* coco::coco::full_node::get_database ( ) const [inline, inherited]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 378 of file search_graph.cc.

10.286.4.12 vdbl::database* coco::coco::full_node::get_database_ptr ( ) const [inline, inherited]

This method returns a const pointer pointing to a locally stored copy of the search database.

Bug This method needs to be replaced, once the COCONUT environment really gets distributed.

Definition at line 389 of file search_graph.cc.

10.286.4.13 vdbl::userid coco::coco::search_node::get_dbuserid ( ) const [inline, inherited]

This is the accessor method for the database user id.

Definition at line 151 of file search_graph.cc.

10.286.4.14 delta coco::work_node::get_delta (const delta_id & *_id*) [inline]

This method returns the delta with delta_id _id.

Definition at line 428 of file search_node.hpp.

10.286.4.15 const delta & coco::work_node::get_delta (const delta_id & *_id*) const [inline]

This method returns a const reference to the delta with delta_id _id.

Definition at line 444 of file search_node.hpp.

10.286.4.16 work_node::constraint_const_iterator coco::work_node::get_end (unsigned int *__type*) const [inline]

The get_end() function returns a constraint_const_iterator pointing after the last constraint of type __type. The iterator then can be used to stop the iterating process through all such constraints at the end. Usage e.g.:

```
constraint_const_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something_const(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

Definition at line 147 of file search_node.hpp.

10.286.4.17 work_node::constraint_iterator coco::work_node::get_end (unsigned int *__type*) [inline]

The get_end() function returns a constraint_iterator pointing after the last constraint of type __type. The iterator then can be used to stop the iterating process through all such constraints at the end. Usage e.g.:

```
constraint_iterator b = get_begin(ex_linear);
while(b != get_end(ex_linear))
{
    do_something(*b);
    ++b;
}
```

to iterate through all linear constraints, which are not bound constraints.

Definition at line 161 of file search_node.hpp.

10.286.4.18 vdbl::viewdbase& coco::coco::work_node::get_fullviewdbase ( ) [inline]

This method returns the actual full view database.

Definition at line 629 of file search_graph.cc.

10.286.4.19 const vdbl::viewdbase& coco::coco::work_node::get_fullviewdbase ( ) const [inline]

This method returns the actual full view database.

Definition at line 632 of file search_graph.cc.

10.286.4.20 search_node_id coco::coco::search_node::get_id ( ) const [inline, inherited]

This is the accessor method for the search node id of this node.

Definition at line 160 of file search_graph.cc.

10.286.4.21 inference_module_cache& coco::coco::work_node::get_inf_mod_cache ( ) [inline]

This method returns the inference module cache for this work node

Definition at line 635 of file search_graph.cc.

10.286.4.22 const model* coco::coco::work_node::get_model ( ) const [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Reimplemented from coco::coco::full_node.

Definition at line 609 of file search_graph.cc.

10.286.4.23 model* coco::coco::work_node::get_model ( ) [inline]

This method returns a const pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 613 of file search_graph.cc.

10.286.4.24 model* coco::coco::full_node::get_model_ptr ( ) const [inline, inherited]

This method returns a pointer pointing to a locally stored copy of the model stored in this full node.

Definition at line 383 of file search_graph.cc.

10.286.4.25 vdbl::rowid coco::coco::search_node::get_rowid ( ) const [inline, inherited]

This is the accessor method for the row id of this node.

Definition at line 166 of file search_graph.cc.

10.286.4.26 transaction_number coco::coco::work_node::get_transaction_number ( ) [inline]

This method returns a unique transaction number for split deltas.

Definition at line 518 of file search_graph.cc.

10.286.4.27 vdbl::viewdbase& coco::coco::work_node::get_viewdbase ( ) [inline]

This method returns the actual view database.

Definition at line 623 of file search_graph.cc.

10.286.4.28 const vdbl::viewdbase& coco::coco::work_node::get_viewdbase ( ) const [inline]

This method returns the actual view database.

Definition at line 626 of file search_graph.cc.

10.286.4.29 work_node_context* coco::coco::work_node::get_work_node_context ( ) [inline]

This method returns the actual work node context

Definition at line 617 of file search_graph.cc.

10.286.4.30 const work_node_context* coco::coco::work_node::get_work_node_context ( ) const [inline]

This method returns the actual work node context

Definition at line 620 of file search_graph.cc.

10.286.4.31 const datamap& coco::coco::work_node::global_info ( ) const [inline]

This method returns the global data used by the algorithm. See `globalinfo`.

Definition at line 760 of file search_graph.cc.

10.286.4.32 bool coco::work_node::global_info (basic_alltype & *b*, const std::string & *i*) const

This method returns the entry with name `i` in the global data used by the algorithm, setting `b`. It returns whether extraction was successful. See `globalinfo`.

Definition at line 340 of file search_node.cc.

10.286.4.33 bool coco::coco::work_node::global_info (basic_alltype & *b*, const char * *i*) const [inline]

This method returns the entry with name `i` in the global data used by the algorithm, setting `b`. It returns whether extraction was successful. See `globalinfo`.

Definition at line 767 of file search_graph.cc.

10.286.4.34 basic_alltype coco::work_node::global_info (const std::string & *i*) const

This method returns the entry with name `i` in the global data used by the algorithm. See `globalinfo`.

Definition at line 348 of file search_node.cc.

10.286.4.35 basic_alltype coco::coco::work_node::global_info (const char * *i*) const [inline]

This method returns the entry with name `i` in the global data used by the algorithm. See `globalinfo`.

Definition at line 774 of file search_graph.cc.

10.286.4.36 gptr<search_node>* coco::coco::search_node::global_model ( ) const [inline, inherited]

This is the accessor method for the global model.

Definition at line 154 of file search_graph.cc.

10.286.4.37 void coco::work_node::init_cnumbers ( )

This method computes the cache values n_bds, n_lin, n_quad, n_poly, and n_other and the log volume.

Definition at line 234 of file search_node.cc.

10.286.4.38 bool coco::coco::full_node::is_delta ( ) const [inline, virtual, inherited]

This method is called to determine whether a search node stores only deltas (delta_node) or a full model (full_node). In case of a full_node it returns `false`.

Reimplemented from coco::coco::search_node.

Definition at line 354 of file search_graph.cc.

10.286.4.39 void coco::coco::search_node::keep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to be the keeper of the annotation `_an`.

Definition at line 173 of file search_graph.cc.

10.286.4.40 void coco::coco::search_node::keep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to be the keeper of all the annotations in `_anv`.

Definition at line 177 of file search_graph.cc.

10.286.4.41 double coco::coco::work_node::log_volume ( ) const [inline]

This method returns the finite approximation to the logarithmic volume of the work_node.

See also

log_vol

Definition at line 754 of file search_graph.cc.

10.286.4.42 void coco::work_node::make_node_order ( )

A call to this method recalculates the node_order for the model DAG stored in the work node.

Definition at line 277 of file search_node.cc.

10.286.4.43 void coco::work_node::make_node_ranges (bool *keep_old_ranges*)

A call to this method adapts the node_ranges vector to the .

Definition at line 256 of file search_node.cc.

10.286.4.44 unsigned int coco::work_node::n (unsigned int *__type*) const [inline]

This method returns the number of constraints of type ___type. Usage, e.g.:

```
n(ex_linear|ex_equality)
```

returns the number of linear equality constraints.

Definition at line 518 of file search_node.hpp.

10.286.4.45 unsigned int coco::coco::full_node::n_annotations ( ) const [inline, inherited]

This method returns the number of annotations stored in this full node.

Definition at line 358 of file search_graph.cc.

10.286.4.46 work_node & coco::work_node::operator= (const work_node & *__w*) [inline]

Standard Assignment Operator

Definition at line 255 of file search_node.hpp.

10.286.4.47 work_node & coco::work_node::operator= (const full_node & *__f*) [inline]

Special Assignment Operator --- be careful when using it!

Reimplemented from coco::coco::full_node.

Definition at line 223 of file search_node.hpp.

10.286.4.48 search_node_relation coco::coco::search_node::parent_relation ( ) const [inline, protected, inherited]

A call to this method returns the relation of this node to its parent in the search graph.

Definition at line 110 of file search_graph.cc.

10.286.4.49 double coco::coco::work_node::reset_gain ( ) [inline]

This method returns the current gain_factor of the work_node and resets it to 1.

Definition at line 779 of file search_graph.cc.

10.286.4.50 void coco::work_node::reset_node_ranges ( ) [inline]

This method resets all unused node ranges to $[-\infty, \infty]$.

Definition at line 508 of file search_node.hpp.

10.286.4.51 void coco::work_node::set_globalinfo ( )

This method extracts the information from the "global info" table and stores it in the `globalinfo` cache of the work_node.

Definition at line 313 of file search_node.cc.

10.286.4.52 void coco::coco::search_node::set_id (const search_node_id & *i*) [inline, inherited]

This is the set method for the search node id of this node.

Definition at line 163 of file search_graph.cc.

10.286.4.53 void coco::coco::search_node::set_rowid (const vdbl::rowid & *i*) [inline, inherited]

This is the set method for the row id of this node.

Definition at line 169 of file search_graph.cc.

10.286.4.54 void coco::search_node::unkeep (const annotation & *_an*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of the annotation `_an`.

Definition at line 82 of file search_node.hpp.

10.286.4.55 void coco::search_node::unkeep (const std::vector< annotation > & *_anv*) [inline, inherited]

A call to this method informs the search node to no longer be the keeper of all the annotations in `_anv`.

Definition at line 93 of file search_node.hpp.

10.286.5 Friends And Related Function Documentation

10.286.5.1 friend class certificate [friend]

Definition at line 808 of file search_graph.cc.

10.286.5.2 friend class certificate_base [friend, inherited]

Definition at line 393 of file search_graph.cc.

10.286.5.3 friend class dag_delta [friend, inherited]

Definition at line 394 of file search_graph.cc.

10.286.5.4 friend class dag_undelta [friend, inherited]

Definition at line 395 of file search_graph.cc.

10.286.5.5 friend class delta [friend]

Definition at line 806 of file search_graph.cc.

10.286.5.6 friend class delta_base [friend, inherited]

Definition at line 392 of file search_graph.cc.

10.286.5.7 work_node operator+ (const work_node & _w, const delta_id & _d) [friend]

This function adds the delta with delta_id _i to work_node _w and returns a new work_node having the delta applied.

Definition at line 298 of file search_node.hpp.

10.286.5.8 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node operator+ (const work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function adds all the deltas whose delta_ids are in the linear container _d to work_node _w and returns a new work_node having all these deltas applied.

Definition at line 325 of file search_node.hpp.

10.286.5.9 work_node& operator+= (work_node & _w, const delta_id & _d) [friend]

This function adds the delta with delta_id _i to work_node _w changing it in that process. The function returns _w.

Definition at line 311 of file search_node.hpp.

10.286.5.10 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node& operator+= (work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function adds the deltas whose delta_ids are in the linear container _d to work_node _w changing it in that process. The function returns _w.

Definition at line 341 of file search_node.hpp.

10.286.5.11 work_node operator- (const work_node & _w, const delta_id & _d) [friend]

This function removes the delta with delta_id _i from work_node _w and returns a new work_node having the delta unapplied.

Definition at line 39 of file search_node.cc.

10.286.5.12 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node operator- (const work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function removes all the deltas whose delta_ids are in the linear container _d from work_node _w and returns a new work_node having all these deltas unapplied.

Definition at line 365 of file search_node.hpp.

10.286.5.13 work_node& operator-= (work_node & _w, const delta_id & _d) [friend]

This function removes (unapplies) the delta with delta_id _i from work_node _w changing it in that process. The function returns _w.

Definition at line 80 of file search_node.cc.

10.286.5.14 template<template< class _Tp, class _TA > class _Ctr, class _Al > work_node& operator-= (work_node & _w, const _Ctr< delta_id, _Al > & _d) [friend]

This function removes (unapplies) the deltas whose delta_ids are in the linear container _d from work_node _w changing it in that process. The function returns _w.

Definition at line 383 of file search_node.hpp.

10.286.5.15 friend class search_graph [friend, inherited]

Definition at line 188 of file search_graph.cc.

10.286.5.16 friend class undelta [friend]

Definition at line 807 of file search_graph.cc.

10.286.5.17 friend class wnc_hook_base [friend]

Definition at line 809 of file search_graph.cc.

10.286.6 Member Data Documentation

10.286.6.1 gptr<vdbl::database>* coco::coco::search_node::__dbase [protected, inherited]

This is a pointer to a global pointer to the search database associated to this search graph.

Definition at line 89 of file search_graph.cc.

10.286.6.2 gptr<search_node>* coco::coco::search_node::__global_model [protected, inherited]

This is a pointer to a global pointer to the top of the search graph. It is NULL for a standalone node or the top of the graph.

Definition at line 86 of file search_graph.cc.

10.286.6.3 vdbl::viewdbase* coco::coco::work_node::__vdb

This is a restricted view to the search database to be used by the inference engines and report modules.

Definition at line 471 of file search_graph.cc.

10.286.6.4 vdbl::viewdbase* coco::coco::work_node::__vdbf

This is a full view to the search database to be used by the inference engines and report modules.

Definition at line 474 of file search_graph.cc.

10.286.6.5 std::vector<annotation> coco::coco::full_node::_ann [inherited]

This is the vector of annotations active at this full node.

Definition at line 283 of file search_graph.cc.

10.286.6.6 vdbl::userid coco::coco::search_node::_dbuser [protected, inherited]

This member stores the database user id under which this search is performed. For the in-memory database this is irrelevant.

Definition at line 92 of file search_graph.cc.

10.286.6.7 search_node_id coco::coco::search_node::_id [protected, inherited]

This is the unique identifier of this search node.

Definition at line 97 of file search_graph.cc.

10.286.6.8 std::vector<annotation> coco::coco::search_node::_keep [protected, inherited]

The _keep member is a list of all those annotations which are kept by this search node. If the node is destroyed all kept annotations are removed from the search database.

Definition at line 101 of file search_graph.cc.

10.286.6.9 gptr<model>* coco::coco::full_node::_m [protected, inherited]

This is a pointer to a global pointer to the model kept in this full node.

Definition at line 279 of file search_graph.cc.

10.286.6.10 vdbl::rowid coco::coco::search_node::_rid [protected, inherited]

This row id specifies the row in the search info table where the hook information for this search_node is stored

Definition at line 105 of file search_graph.cc.

10.286.6.11 search_node_relation coco::coco::search_node::_snr [protected, inherited]

This member specifies the relation of the search node to its parent(s) in the search graph.

Definition at line 95 of file search_graph.cc.

10.286.6.12 std::list<delta_id>::iterator coco::coco::work_node::deltanew_it

This iterator points to the first 'new' delta of the work_node.

Definition at line 443 of file search_graph.cc.

10.286.6.13 std::list<delta_id> coco::coco::work_node::deltas

This is the list of all deltas, which had to be applied to construct the given work_node. This includes the deltas necessary to extract the search_node to the work_node from the graph, as well as the "new" deltas,

which have been applied by the solution strategy while the work node was analyzed by various inference engines.

Definition at line 440 of file search_graph.cc.

10.286.6.14 vdbl::standard_table* coco::coco::work_node::dtable

This is a pointer to the "deltas" table in the search database.

Definition at line 456 of file search_graph.cc.

10.286.6.15 vdbl::tableid coco::coco::work_node::dtable_id

This is the table identifier of the "deltas" table in the search database.

Definition at line 459 of file search_graph.cc.

10.286.6.16 double coco::coco::work_node::gain_factor

This member keeps an improvement factor (in [0,1]) in bounds sizes since it was last reset.

Definition at line 499 of file search_graph.cc.

10.286.6.17 vdbl::standard_table* coco::coco::work_node::gitable

This is a pointer to the "global info" table in the search database.

Definition at line 461 of file search_graph.cc.

10.286.6.18 vdbl::tableid coco::coco::work_node::gitable_id

This is the table identifier of the "global info" table in the search database.

Definition at line 464 of file search_graph.cc.

10.286.6.19 datamap coco::coco::work_node::globalinfo

This member keeps a cache of the global data used in the algorithm

Definition at line 501 of file search_graph.cc.

10.286.6.20 bool coco::coco::work_node::infeasible

This boolean specifies, whether the problem represented by this work node is known to be infeasible.

Definition at line 492 of file search_graph.cc.

10.286.6.21 double coco::coco::work_node::log_vol

This member keeps a finite approximation to the logarithmic volume of the box formed by the variable bounds of the original variables.

Definition at line 496 of file search_graph.cc.

10.286.6.22 std::vector<unsigned int> coco::coco::work_node::node_order

The node_order vector provides a linear order on the DAG nodes, which is compatible with the DAG structure, i.e., all ancestors of a node are ordered after the node. The vector contains the order as a sequence node numbers of the DAG nodes.

Definition at line 489 of file search_graph.cc.

10.286.6.23 std::vector<interval> coco::coco::work_node::node_ranges

The node_ranges vector keeps the current best known ranges of all nodes in the model DAG. The vector is indexed by the node numbers of the DAG nodes.

Definition at line 484 of file search_graph.cc.

10.286.6.24 std::set<search_node_id> coco::coco::work_node::parents_in_graph

This parameter stores the parents of the work node in the graph

Definition at line 450 of file search_graph.cc.

10.286.6.25 std::map<transaction_number,std::list<std::vector<delta> > > coco::coco::work_node::proposed_splits

This member stores all splits which have been proposed by the various inference engines that can be used to calculate possible splits. Every proposed split (being associated with a split_delta) gets assigned a unique transaction number. This is later used for unapplying the split_delta if necessary. Every split is itself a list of vectors of deltas. Every vector of deltas in the list is associated with one child node generated by the split, and the vector of deltas contains all deltas which have to be applied to the work node for constructing the respective child node from the work node.

Definition at line 531 of file search_graph.cc.

10.286.6.26 std::map<delta_id, transaction_number> coco::coco::work_node::split_delta_ids

This map connects split_delta delta identifiers with transaction numbers in the proposed_splits map.

Definition at line 534 of file search_graph.cc.

10.286.6.27 std::list<delta_id>::iterator coco::coco::work_node::splithook_deltanew_it

This iterator points to the first 'new' delta of the work_node generated due to splits and hooks.

Definition at line 447 of file search_graph.cc.

10.286.6.28 std::map<delta_id,undelta> coco::coco::work_node::undeltas

This map connects delta identifiers of previously applied deltas with their corresponding undelta information.

undelta

Definition at line 454 of file search_graph.cc.

10.286.6.29 work_node_context* coco::coco::work_node::wnc

This is the work node context corresponding to the current work node.

Definition at line 468 of file search_graph.cc.

The documentation for this class was generated from the following files:

- search_node.h
- search_node.cc
- search_node.hpp

10.287 coco::work_node_comp_hook Class Reference

The work_node_comp_hook class (work node computation hook)

`#include <comp_hook.h>`

Public Member Functions

- work_node_comp_hook (const wnc_hook_base &w)
- work_node_comp_hook (const work_node_comp_hook &wh)
- ~work_node_comp_hook ()
- work_node_comp_hook & operator= (const work_node_comp_hook &w)
- void operator() (const work_node &wn, dbt_row &dbr, std::list< delta > *add_ds=NULL, std::list< certificate > *add_cs=NULL)
- bool init_columns (vdbl::standard_table &stable)
- bool drop_columns (vdbl::standard_table &stable)
- const std::string & name () const

10.287.1 Detailed Description

The work_node_comp_hook class is used to compute info about work_nodes just when the work node is split and stored in the search graph. It is, like the delta class, designed as a wrapper class in order to overcome the problem that copy constructors cannot be overloaded. Work node computation hooks are stored in the search_graph, can be registered and released with search_graph methods.

10.287.2 Constructor & Destructor Documentation

10.287.2.1 coco::work_node_comp_hook::work_node_comp_hook (const wnc_hook_base & *w*) [inline]

Constructor, which constructs a work node computation hook from a wnc_hook_base. The clone operation for the wnc_hook_base will be called in that process.

Definition at line 193 of file comp_hook.h.

10.287.2.2 coco::work_node_comp_hook::work_node_comp_hook (const work_node_comp_hook & *wh*) [inline]

Copy Constructor, which constructs a new work node computation hook from an existing one. The clone operation for the wnc_hook_base will be called in that process, effectively overloading the copy constructor for the wnc_hook_base.

Definition at line 198 of file comp_hook.h.

10.287.2.3 coco::work_node_comp_hook::~work_node_comp_hook ( ) [inline]

Standard Destructor calling `delete` on `__wh`.

Definition at line 203 of file comp_hook.h.

10.287.3 Member Function Documentation

10.287.3.1 bool coco::work_node_comp_hook::drop_columns (vdbl::standard_table & *stable*) [inline]

Upon unregistering this hook, destroy the column(s) in the "search info" table in which the result(s) of this hook are stored.

Definition at line 227 of file comp_hook.h.

10.287.3.2 bool coco::work_node_comp_hook::init_columns (vdbl::standard_table & *stable*) [inline]

Upon registering this hook, initialize the column(s) in the "search info" table in which the result(s) of this hook are stored.

Definition at line 222 of file comp_hook.h.

10.287.3.3 const std::string & coco::work_node_comp_hook::name ( ) const [inline]

Return the identifier string for this work node computation hook.

Definition at line 232 of file comp_hook.h.

10.287.3.4 void coco::work_node_comp_hook::operator() (const work_node & *wn*, dbt_row & *dbr*, std::list< delta > * *add_ds* = `NULL`, std::list< certificate > * *add_cs* = `NULL`) [inline]

The evaluation operator of this computation hook. It stores the result of the hook applied to work_node `wn` in dbt_row `dbr`, which in return is stored in the "search info" table of the search database. The hook can compute additional deltas and add them to `add_ds`, which are applied to the work node during the split.

Definition at line 216 of file comp_hook.h.

10.287.3.5 work_node_comp_hook & coco::work_node_comp_hook::operator= (const work_node_comp_hook & *w*) [inline]

Assignment operator, which uses the clone operation for the wnc_hook_base, effectively overloading the assignment operator for the wnc_hook_base.

Definition at line 209 of file comp_hook.h.

The documentation for this class was generated from the following file:

- comp_hook.h

10.288 coco::work_node_context Class Reference

The evaluation context when retrieving from the search database.

`#include <wnodectx.h>`

Public Member Functions

- work_node_context ()
- work_node_context (const work_node *_i)
- work_node_context (const work_node_context &_w)
- virtual ~work_node_context ()
- work_node_context & operator= (const work_node_context &_w)
- const work_node * wn () const

10.288.1 Detailed Description

This class provides the evaluation context when a view to the search database is created for an inference engine. This mainly influences the stored procedures (vdbl::method).

10.288.2 Constructor & Destructor Documentation

10.288.2.1 coco::work_node_context::work_node_context ( ) [inline]

Standard Constructor

Definition at line 50 of file wnodectx.h.

10.288.2.2 coco::work_node_context::work_node_context (const work_node * _i) [inline]

Constructor which initializes the work_node to _i.

Definition at line 52 of file wnodectx.h.

10.288.2.3 coco::work_node_context::work_node_context (const work_node_context & _w) [inline]

Standard Copy Constructor

Definition at line 54 of file wnodectx.h.

10.288.2.4 virtual coco::work_node_context::~work_node_context ( ) [inline, virtual]

Standard Destructor

Definition at line 56 of file wnodectx.h.

10.288.3 Member Function Documentation

10.288.3.1 work_node_context& coco::work_node_context::operator= (const work_node_context & _w) [inline]

Standard Assignment Operator

Definition at line 59 of file wnodectx.h.

10.288.3.2 const work_node* coco::work_node_context::wn ( ) const [inline]

This method returns a global pointer to the work_node of this context.

Definition at line 64 of file wnodectx.h.

The documentation for this class was generated from the following file:

- wnodectx.h

10.289 coco::coco::work_node_context Class Reference

The evaluation context when retrieving from the search database.

10.290.1 Detailed Description

xexp_func is a one dimensional function defined by x∗exp(c∗x), where c is a real constant.

10.290.2 Member Typedef Documentation

10.290.2.1 typedef std::triple<interval, interval, d1func_point_t> coco::d1func::point_info [inherited]

The information on one point .first is the point, .second the value

Definition at line 110 of file d1func.h.

10.290.2.2 typedef std::vector<point_info> coco::d1func::point_list [inherited]

a list of points for function value, first and second derivatives

Definition at line 113 of file d1func.h.

10.290.3 Member Enumeration Documentation

10.290.3.1 enum coco::d1func::d1func_point_t [inherited]

The possible classes for special points in the lists: d1fp_regular: At this point the function is regular (for internal use only!) d1fp_extremum: The point is a local extremum d1fp_evenpoleup: At this point the function has a positive even pole d1fp_evenpoledn: At this point the function has a negative even pole d1fp_oddpoleup: At this point the function has an odd pole like 1/x at 0 d1fp_oddpoledn: At this point the function has an odd pole like -1/x at 0 d1fp_jumpldef: At this point the function has a jump (left side defined) d1fp_jumpludef: At this point the function has a jump (left side not defined) d1fp_point-: At this point the function has the specified value d1fp_undefined: In the given interval the function is undefined d1fp_wild: In the given interval the function has "wild" behaviour d1fp_jumprdef: At this point the function has a jump (right side defined) d1fp_jumprudef: At this point the function has a jump (right side not defined) d1fp_unknown: At this point the function has a unknown behaviour (for internal use only!)

Enumerator:

d1fp_unknown

d1fp_regular

d1fp_extremum

d1fp_evenpoleup

d1fp_evenpoledn

d1fp_oddpoleup

d1fp_oddpoledn

d1fp_jumpldef

d1fp_jumpludef

d1fp_point

d1fp_undefined

d1fp_wild
d1fp_jumprdef
d1fp_jumprudef

Definition at line 95 of file d1func.h.

10.290.3.2 enum coco::d1func::d1solve_t [inherited]

The possible functions for 1D Newton solving: d1solve_0: f(x) = c d1solve_1: f(x) - f(z) - f'(x)(x-z) = 0 d1solve_2: 1/(x-z)(f(x)-f(z))(1+(x-w)(x-z)) - (f(w)-f(z))/(w-z) - (x-w)/(x-z) f'(x) = 0

Enumerator:

d1solve_0
d1solve_1
d1solve_2

Definition at line 106 of file d1func.h.

10.290.4 Constructor & Destructor Documentation

10.290.4.1 coco::xexp_func::xexp_func (double *_c*, unsigned int *MAXORDER* = 5) [inline]

Definition at line 336 of file xexp.h.

10.290.5 Member Function Documentation

10.290.5.1 virtual uint64_t coco::xexp_func::chash ( ) [inline, virtual]

the const hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 54 of file xexp.h.

10.290.5.2 convex_info coco::d1func::convexity (const interval & *i*, unsigned int *k*) const [virtual, inherited]

return convexity information on `i`.

Definition at line 2308 of file d1func.cc.

10.290.5.3 virtual std::string coco::xexp_func::dag_out ( ) const [inline, virtual]

the parameters written in DAG format (it must contain necessary ':'s)

Reimplemented from coco::d1func.

Definition at line 60 of file xexp.h.

10.290.5.4 virtual int coco::d1func::degree_update (int *in_degree*) const [inline, virtual, inherited]

return degree information for in-argument degree `in_degree`.

Definition at line 457 of file d1func.h.

10.290.5.5 virtual int coco::xexp_func::differentiability (const interval & *i*, unsigned int *k*) const [inline, virtual]

return differentiability information on `i`.

Reimplemented from coco::d1func.

Definition at line 342 of file xexp.h.

10.290.5.6 virtual double coco::xexp_func::eval (double *x*, unsigned int *k*) const [inline, virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 66 of file xexp.h.

10.290.5.7 diffNumber coco::d1func::eval (const diffNumber & *x*, unsigned int *k*) const [virtual, inherited]

the diffNumber evaluation

Reimplemented in coco::dag_d1func.

Definition at line 349 of file d1func.cc.

10.290.5.8 hessNumber coco::d1func::eval (const hessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the hessNumber evaluation

Definition at line 334 of file d1func.cc.

10.290.5.9 interval coco::d1func::eval (const interval & *x_in*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 390 of file d1func.cc.

10.290.5.10 diffI coco::d1func::eval (const diffI & *x*, unsigned int *k*) const [virtual, inherited]

the interval diffNumber evaluation

Definition at line 715 of file d1func.cc.

10.290.5.11 ihessNumber coco::d1func::eval (const ihessNumber & *x*, unsigned int *k*) const [virtual, inherited]

the interval hessNumber evaluation

the hessNumber evaluation

Definition at line 411 of file d1func.cc.

10.290.5.12 Islope coco::d1func::eval (const Islope & *x*, unsigned int *k*) const [virtual, inherited]

the interval slope evaluation

the interval diffNumber evaluation

Definition at line 429 of file d1func.cc.

10.290.5.13 interval_set coco::d1func::eval (const interval_set & *x*, unsigned int *k*) const [virtual, inherited]

the range evaluation

Definition at line 794 of file d1func.cc.

10.290.5.14 interval coco::d1func::eval_slp (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval first order slope evaluation at center z

Definition at line 1403 of file d1func.cc.

10.290.5.15 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *y*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at centers z and y

Definition at line 1984 of file d1func.cc.

10.290.5.16 interval coco::d1func::eval_slp2 (const interval & *z*, const interval & *x*, unsigned int *k*) const [virtual, inherited]

the interval second order slope evaluation at double center z

Definition at line 1991 of file d1func.cc.

10.290.5.17 virtual std::pair<double,double> coco::xexp_func::evald (double *x*, unsigned int *k*) const [inline, virtual]

the point and derivative evaluation

Reimplemented from coco::d1func.

Definition at line 86 of file xexp.h.

10.290.5.18 virtual void coco::xexp_func::evalf (double *x*, double * *r*, unsigned int *k*) const [inline, virtual]

the point and derivative evaluation

Reimplemented from coco::d1func.

Definition at line 174 of file xexp.h.

10.290.5.19 virtual std::triple<double,double,double> coco::xexp_func::evalt (double *x*, unsigned int *k*) const [inline, virtual]

the point and derivative evaluation

Reimplemented from coco::d1func.

Definition at line 125 of file xexp.h.

10.290.5.20 virtual const func_info& coco::d1func::ff (unsigned int *k*) const [inline, virtual, inherited]

retrieve the k th special points list

Definition at line 469 of file d1func.h.

10.290.5.21 virtual const char* coco::xexp_func::func_name ( ) const [inline, virtual]

the name of the d1func.

Implements coco::d1func.

Definition at line 57 of file xexp.h.

10.290.5.22 virtual interval coco::xexp_func::imperfect_eval (const interval & *x*, unsigned int *k*) const [inline, virtual]

the imperfect function evaluations

Implements coco::d1func.

Definition at line 233 of file xexp.h.

10.290.5.23 void coco::d1func::internal_eval_d1fp (const diffI & *x*, diffI & *res*, const std::vector< d1func_point_t > & *ptin*, std::vector< d1func_point_t > & *ptres*, unsigned int *k*) const [virtual, inherited]

perform internal evaluations to update eventual point lists of "higher" functions.

Definition at line 168 of file d1func.cc.

10.290.5.24 interval_set coco::d1func::intersect_inv (const interval & *x*, const interval & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1708 of file d1func.cc.

10.290.5.25 interval_set coco::d1func::intersect_inv (const interval_set & *x*, const interval_set & *r*, unsigned int *k*) const [virtual, inherited]

back propagation

Definition at line 1778 of file d1func.cc.

10.290.5.26 d1func_monotonicity_t coco::d1func::monotonicity (const interval & *x*, unsigned int *k*) const [virtual, inherited]

return monotonicity information on `i`.

Definition at line 2185 of file d1func.cc.

10.290.5.27 virtual bool coco::d1func::operator!= (const d1func & *b*) const [inline, virtual, inherited]

the other comparison operator

Definition at line 476 of file d1func.h.

10.290.5.28 virtual bool coco::xexp_func::operator== (const d1func & *b*) const [inline, virtual]

the comparison operator

Reimplemented from coco::d1func.

Definition at line 251 of file xexp.h.

10.290.5.29 virtual bool coco::d1func::order_is_supported (unsigned int *k*) const [inline, virtual, inherited]

check whether evaluation of this order is supported.

Definition at line 460 of file d1func.h.

10.290.5.30 virtual std::ostream& coco::d1func::print_add (std::ostream & *o*) const [inline, virtual, inherited]

additional info written in DAG format (it must contain dag lines)

Reimplemented in coco::dag_d1func.

Definition at line 208 of file d1func.h.

10.290.5.31 virtual std::string coco::xexp_func::print_params ( ) const [inline, virtual]

the parameters written in printable form

Reimplemented from coco::d1func.

Definition at line 63 of file xexp.h.

10.290.5.32 virtual void coco::xexp_func::raise_order (unsigned int *neworder*) [inline, virtual]

raise the order of the supported function evaluation to neworder

Reimplemented from coco::d1func.

Definition at line 258 of file xexp.h.

10.290.5.33 virtual unsigned int coco::d1func::supported_eval_order ( ) const [inline, virtual, inherited]

return the maximal evaluation order supported.

Definition at line 466 of file d1func.h.

10.290.5.34 virtual uint64_t coco::xexp_func::thash ( ) [inline, virtual]

the pure hash value for hash calculation in the DAG

Implements coco::d1func.

Definition at line 51 of file xexp.h.

10.290.5.35 const char * coco::d1func::toString (const d1func::d1func_point_t & *t*) const [inherited]

Definition at line 2415 of file d1func.cc.

10.290.6 Member Data Documentation

10.290.6.1 std::vector<func_info> coco::d1func::_f [protected, inherited]

the function info tables for function values and derivatives.

Definition at line 163 of file d1func.h.

10.290.6.2 int coco::d1func::basic_diff [protected, inherited]

basic differentiability

Definition at line 160 of file d1func.h.

10.290.6.3 double coco::d1func::dod_left [protected, inherited]

the left limit of the DOD

Definition at line 156 of file d1func.h.

10.290.6.4 double coco::d1func::dod_right [protected, inherited]

the right limit of the DOD

Definition at line 158 of file d1func.h.

10.290.6.5 volatile int coco::d1func::MAXLEN [inherited]

maximal lenght of the interval set returned

Definition at line 167 of file d1func.h.

Protected Member Functions

- bool is_cached (const node_data_type &__data)

10.291.1 Detailed Description

This class is a cached forward evaluator performing a function range evaluation by natural xxxNumber extension.

10.291.2 Member Typedef Documentation

10.291.2.1 typedef _Base::const_walker coco::coco::cached_forward_evaluator_base::const_walker [inherited]

This is the type of the walker, which is used for the short-cuts.

Definition at line 724 of file search_graph.cc.

10.291.2.2 typedef _Base::node_data_type coco::coco::cached_forward_evaluator_base::node_data_type [inherited]

The node_data_type is the datatype of the nodes of the graph.

Definition at line 720 of file search_graph.cc.

10.291.2.3 typedef _Base::return_value coco::coco::cached_forward_evaluator_base::return_value [inherited]

This type is the result type of the evaluator.

Definition at line 722 of file search_graph.cc.

10.291.3 Constructor & Destructor Documentation

10.291.3.1 coco::xxxNumber_eval::xxxNumber_eval (const std::vector< xxxNumber_t > & __x, const variable_indicator & __v, const model & __m, std::vector< xxxNumber_t > * __c) [inline]

Constructor: ___x is the box over which the function range shall be evaluated, ___v is a variable indicator specifying the variables that have changed value since the last evaluation, ___m specifies the DAG, and ___c the cache (may be NULL). The boolean do_i determines whether the natural xxxNumber extension will use known node ranges for reducing the ranges.

Definition at line 184 of file numfeval.h.

10.291.3.2 coco::xxxNumber_eval::xxxNumber_eval (const xxxNumber_eval & __v) [inline]

Standard Copy Constructor

Definition at line 261 of file numfeval.h.

10.291.3.3 coco::xxxNumber_eval::~xxxNumber_eval ( ) [inline]

Standard Destructor

Definition at line 264 of file numfeval.h.

10.291.4 Member Function Documentation

10.291.4.1 void coco::xxxNumber_eval::calculate (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 408 of file numfeval.h.

10.291.4.2 virtual void coco::coco::cached_forward_evaluator_base::calculate (const node_data_type & __data) [inline, virtual, inherited]

This method is called right after all children of a node have been visited. The ___data parameter contains the node data of the graph node being visited.

Definition at line 797 of file search_graph.cc.

10.291.4.3 xxxNumber_t coco::xxxNumber_eval::calculate_value (bool eval_all) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< xxxNumber_eval_type, expression_node, xxxNumber_t, expression_const_walker >.

Definition at line 894 of file numfeval.h.

10.291.4.4 virtual void coco::coco::cached_forward_evaluator_base::cleanup (const node_data_type & __data) [inline, virtual, inherited]

The cleanup method is called just before calculate_value and should be used to clean up dynamically allocated data. The __data parameter contains the node data of the graph node being visited.

Definition at line 805 of file search_graph.cc.

10.291.4.5 int coco::coco::cached_forward_evaluator_base::collect (const node_data_type & __data, const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each normal node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 751 of file search_graph.cc.

10.291.4.6 void coco::xxxNumber_eval::initialize ( ) [inline, virtual]

This is an evaluator method, as defined for the various evaluators.

Reimplemented from coco::coco::cached_forward_evaluator_base< xxxNumber_eval_type, expression_node, xxxNumber_t, expression_const_walker >.

Definition at line 306 of file numfeval.h.

10.291.4.7 int coco::xxxNumber_eval::initialize (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 308 of file numfeval.h.

10.291.4.8 virtual int coco::coco::cached_forward_evaluator_base::initialize (const node_data_type & __data) [inline, virtual, inherited]

This method is called at a normal node before any children are visited. The __data parameter contains the node data of the graph node being visited. The return value determines how the graph walk proceeds.

<0	perform a short-cut (the short_cut_to method will be called),
0	don't visit the children, proceed with postorder,
>0	continue with the walk by visiting the children.

Definition at line 793 of file search_graph.cc.

10.291.4.9 bool coco::xxxNumber_eval::is_cached (const node_data_type & __data) [inline, protected, virtual]

This function determines, whether the range for this node is already available.

Reimplemented from coco::coco::cached_forward_evaluator_base< xxxNumber_eval_type, expression_node, xxxNumber_t, expression_const_walker >.

Definition at line 114 of file numfeval.h.

10.291.4.10 void coco::xxxNumber_eval::new_interval (const std::vector< xxxNumber_t > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation point to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 287 of file numfeval.h.

10.291.4.11 void coco::xxxNumber_eval::new_point (const std::vector< xxxNumber_t > & __x, const variable_indicator & __v) [inline]

This method changes the evaluation point to __x. The parameter __v specifies which variables have changed value since the last evaluation.

Definition at line 278 of file numfeval.h.

10.291.4.12 void coco::coco::cached_forward_evaluator_base::postorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right after all children of a node have been visited. It is translated into calls to calculate and cleanup.

Definition at line 745 of file search_graph.cc.

10.291.4.13 int coco::coco::cached_forward_evaluator_base::preorder (const node_data_type & __data) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before any children of a node are visited. It checks whether the result of this node is cached and calls either retrieve_from_cache and stops the downwards walk or calls initialize.

Definition at line 733 of file search_graph.cc.

10.291.4.14 void coco::xxxNumber_eval::retrieve_from_cache (const expression_node & __data) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 417 of file numfeval.h.

10.291.4.15 virtual void coco::coco::cached_forward_evaluator_base::retrieve_from_cache (const node_data_type & __data) [inline, virtual, inherited]

The retrieve_from_cache method is called for retrieving the result for this node from the cache or calculate it without visiting the node's children.

Definition at line 801 of file search_graph.cc.

10.291.4.16 expression_const_walker coco::xxxNumber_eval::short_cut_to (const expression_node & __data) [inline]

NOP version, not needed

Definition at line 267 of file numfeval.h.

10.291.4.17 int coco::xxxNumber_eval::update (const xxxNumber_t & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 424 of file numfeval.h.

10.291.4.18 int coco::xxxNumber_eval::update (const expression_node & __data, const xxxNumber_t & __rval) [inline]

This is an evaluator method, as defined for the various evaluators.

Definition at line 433 of file numfeval.h.

10.291.4.19 virtual int coco::coco::cached_forward_evaluator_base::update (const node_data_type & __data, const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 815 of file search_graph.cc.

10.291.4.20 virtual int coco::coco::cached_forward_evaluator_base::update (const return_value & __rval) [inline, virtual, inherited]

The update method is called for each virtual node everytime a child node has been visited passing the return value of the child. The `__data` parameter contains the node data of the graph node being visited. The return value has the following effect:

<0	stop visiting children of this node,
0	continue with the graph walk downwards the next child,
>0	skip as many children.

Definition at line 827 of file search_graph.cc.

10.291.4.21 return_value coco::coco::cached_forward_evaluator_base::value ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a normal node to retrieve the return value. It is translated to a call to calculate_value with parameter `false`.

Definition at line 763 of file search_graph.cc.

10.291.4.22 int coco::coco::cached_forward_evaluator_base::vcollect (const return_value & __rval) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called for each virtual node everytime a child node has been visited passing the return value of the child. It is translated to a call to update.

Definition at line 757 of file search_graph.cc.

10.291.4.23 void coco::coco::cached_forward_evaluator_base::vinit ( ) [inline, inherited]

This method is needed by a visitor using recursive_short_cut_walk for traversing the graph. It is called before performing any graph walk when at a virtual node. It is translated to initialize.

Definition at line 772 of file search_graph.cc.

10.291.4.24 return_value coco::coco::cached_forward_evaluator_base::vvalue ( ) [inline, inherited]

This method is needed by a visitor (see VGTL documentation) and is called right before the end of the visit of a virtual node to retrieve the return value. It is translated to a call to calculate_value with parameter `true`.

Definition at line 768 of file search_graph.cc.

The documentation for this class was generated from the following file:

- numfeval.h

10.292 coco::xxxNumber_eval_type Struct Reference

Visitor data for xxxNumber_eval.

`#include <numfeval.h>`

Definition at line 921 of file dbcompare_expression_scanner.cc.

10.295.2 Member Function Documentation

10.295.2.1 int FlexLexer::debug ( ) const [inline, inherited]

Definition at line 91 of file FlexLexer.h.

10.295.2.2 void yyFlexLexer::LexerError (const char * *msg*) [protected, virtual]

Definition at line 1567 of file dbcompare_expression_scanner.cc.

10.295.2.3 int yyFlexLexer::LexerInput (char * *buf*, int *max_size*) [protected, virtual]

Definition at line 943 of file dbcompare_expression_scanner.cc.

10.295.2.4 void yyFlexLexer::LexerOutput (const char * *buf*, int *size*) [protected, virtual]

Definition at line 970 of file dbcompare_expression_scanner.cc.

10.295.2.5 int FlexLexer::lineno ( ) const [inline, inherited]

Definition at line 89 of file FlexLexer.h.

10.295.2.6 void FlexLexer::set_debug (int *flag*) [inline, inherited]

Definition at line 92 of file FlexLexer.h.

10.295.2.7 void yyFlexLexer::switch_streams (FLEX_STD istream * *new_in*, FLEX_STD ostream * *new_out*) [virtual]

Implements FlexLexer.

Definition at line 928 of file dbcompare_expression_scanner.cc.

10.295.2.8 YY_BUFFER_STATE yyFlexLexer::yy_create_buffer (FLEX_STD istream * *s*, int *size*) [read, virtual]

Allocate and initialize an input buffer state.

Parameters

file	A readable stream.
size	The character buffer size in bytes. When in doubt, use YY_BUF_SIZE.

Returns

the allocated buffer state.

Implements FlexLexer.

Definition at line 1334 of file dbcompare_expression_scanner.cc.

10.295.2.9 void yyFlexLexer::yy_delete_buffer (struct yy_buffer_state * *b*) [virtual]

Destroy the buffer.

Parameters

b	a buffer created with yy_create_buffer()

Implements FlexLexer.

Definition at line 1362 of file dbcompare_expression_scanner.cc.

10.295.2.10 void yyFlexLexer::yy_flush_buffer (struct yy_buffer_state * *b*) [protected]

Discard all buffered characters. On the next scan, YY_INPUT will be called.

Parameters

b	the buffer state to be flushed, usually `YY_CURRENT_BUFFER`.

Definition at line 1408 of file dbcompare_expression_scanner.cc.

10.295.2.11 int yyFlexLexer::yy_get_next_buffer ( ) [protected]

Definition at line 982 of file dbcompare_expression_scanner.cc.

Definition at line 1525 of file dbcompare_expression_scanner.cc.

10.295.2.17 void yyFlexLexer::yy_switch_to_buffer (struct yy_buffer_state * *new_buffer*) [virtual]

Switch to a different input buffer.

Parameters

new_buffer	The new input buffer.

Implements FlexLexer.

Definition at line 1289 of file dbcompare_expression_scanner.cc.

10.295.2.18 int yyFlexLexer::yy_top_state ( ) [protected]

Definition at line 1558 of file dbcompare_expression_scanner.cc.

10.295.2.19 yy_state_type yyFlexLexer::yy_try_NUL_trans (yy_state_type *current_state*) [protected]

Definition at line 1140 of file dbcompare_expression_scanner.cc.

10.295.2.20 void yyFlexLexer::yyensure_buffer_stack (void) [protected]

Definition at line 1486 of file dbcompare_expression_scanner.cc.

10.295.2.21 int yyFlexLexer::yyinput ( ) [protected]

Definition at line 1200 of file dbcompare_expression_scanner.cc.

10.295.2.22 int FlexLexer::YYLeng ( ) [inline, inherited]

Definition at line 66 of file FlexLexer.h.

10.295.2.23 int FlexLexer::yylex (FLEX_STD istream * *new_in*, FLEX_STD ostream * *new_out* = 0) [inline, inherited]

Definition at line 78 of file FlexLexer.h.

10.295.2.24 int yyFlexLexer::yylex ( ) [virtual]

Implements FlexLexer.

Definition at line 319 of file dbcompare_expression_scanner.cc.

10.295.2.25 void yyFlexLexer::yypop_buffer_state (void)

Removes and deletes the top of the stack, if present. The next element becomes the new top.

Definition at line 1467 of file dbcompare_expression_scanner.cc.

10.295.2.26 void yyFlexLexer::yypush_buffer_state (struct yy_buffer_state * *new_buffer*)

Pushes the new state onto the stack. The new state becomes the current state. This function will allocate the stack if necessary.

Parameters

new_buffer	The new state.

Definition at line 1437 of file dbcompare_expression_scanner.cc.

10.295.2.27 void yyFlexLexer::yyrestart (FLEX_STD istream * *s*) [virtual]

Immediately switch to a different input stream.

Parameters

input_file	A readable stream.

Note

This function does not reset the start condition to `INITIAL` .

Implements FlexLexer.

Definition at line 1272 of file dbcompare_expression_scanner.cc.

10.295.2.28 const char* FlexLexer::YYText ( ) [inline, inherited]

Definition at line 65 of file FlexLexer.h.

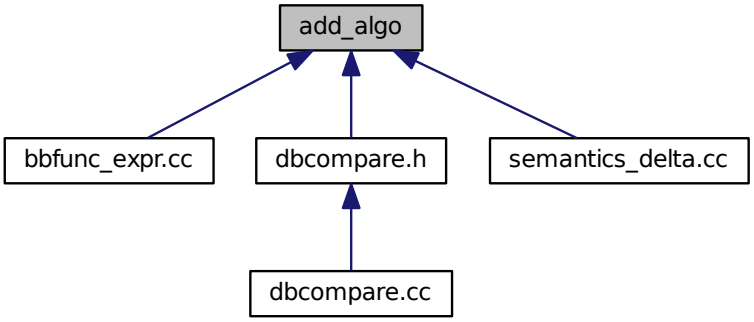
The documentation for this class was generated from the following files:

- FlexLexer.h
- dbcompare_expression_scanner.cc
- dbcompare_sortorder_scanner.cc
- Number_scanner.cc

11 File Documentation

11.1 add_algo File Reference

This graph shows which files directly or indirectly include this file:



Defines

- #define _CPP_ADD_ALGO 1

11.1.1 Detailed Description

This is a like a Standard C++ Library header. You should `#include` this header in your programs, rather than any of the "st[dl]_*.h" implementation files.

Definition in file add_algo.

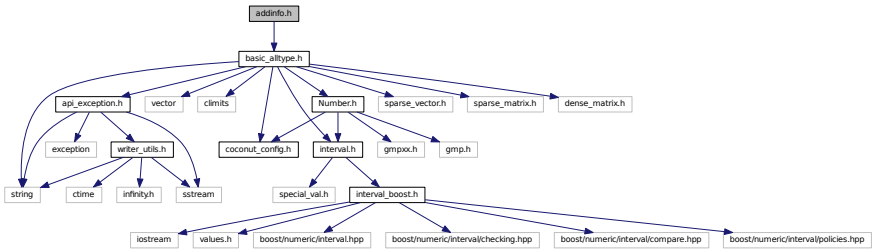
11.1.2 Define Documentation

11.1.2.1 #define _CPP_ADD_ALGO 1

Definition at line 38 of file add_algo.

11.2 addinfo.h File Reference

`#include <basic_alltype.h>` Include dependency graph for addinfo.h:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

- typedef basic_alltype coco::additional_info_u

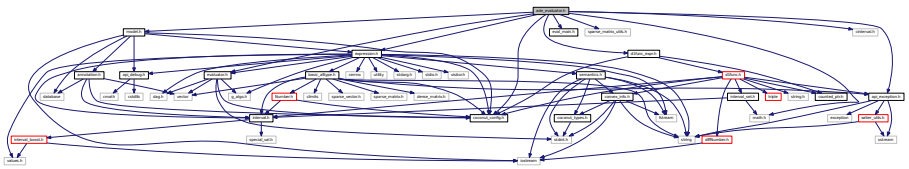
  type definition for backwards compatibility with earlier API versions

11.2.1 Detailed Description

Definition in file addinfo.h.

11.3 ade_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <model.h>` `#include <eval_main.h>` `#include <sparse_matrix_-utils.h>` `#include <math.h>` `#include <cinterval.h>` `#include <d1func_expr.-h>` `#include <api_exception.h>` Include dependency graph for ade_evaluator.h:



Classes

- struct coco::analyticd_eval_type
- class coco::analyticd_eval

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

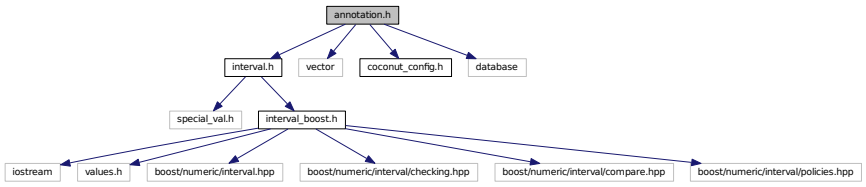
- typedef analyticd(∗ coco::analyticd_evaluator)(const std::vector< analyticd > ∗__x, const variable_indicator &__v)

11.3.1 Detailed Description

Definition in file ade_evaluator.h.

11.4 annotation.h File Reference

`#include <interval.h>` `#include <vector>` `#include <coconut_config.h>` `#include <database>` Include dependency graph for annotation.h:



This graph shows which files directly or indirectly include this file:

Classes

- class coco::annotation

  Annotations for Models.

Namespaces

- namespace coco

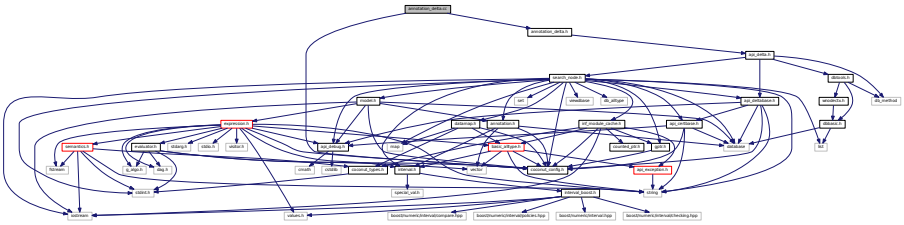
  the main namespace of the COCONUT API

11.4.1 Detailed Description

Definition in file annotation.h.

11.5 annotation_delta.cc File Reference

`#include <coconut_config.h>` `#include <annotation_delta.h>` Include dependency graph for annotation_delta.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

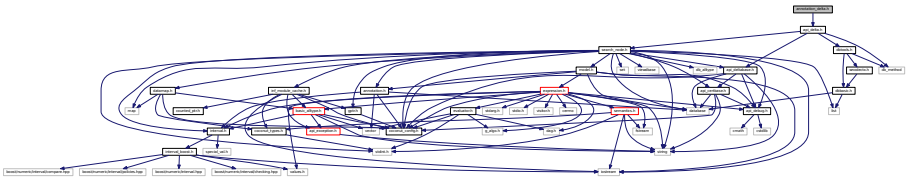
- typedef std::vector< std::pair < vdbl::tableid, vdbl::rowid > > coco::trvec

11.5.1 Detailed Description

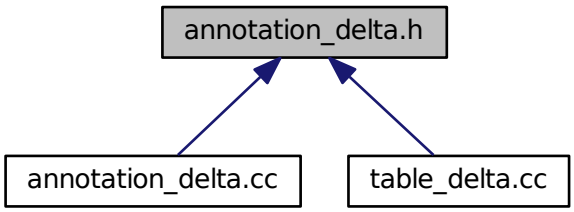
Definition in file annotation_delta.cc.

11.6 annotation_delta.h File Reference

`#include <api_delta.h>` Include dependency graph for annotation_delta.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::annotation_undelta

  the undelta class for annotation changes
- class coco::annotation_delta

  the delta class for annotation changes

Namespaces

- namespace coco

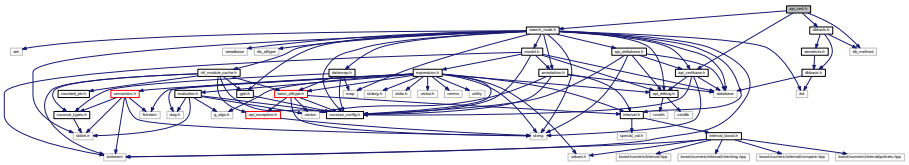
  the main namespace of the COCONUT API

11.6.1 Detailed Description

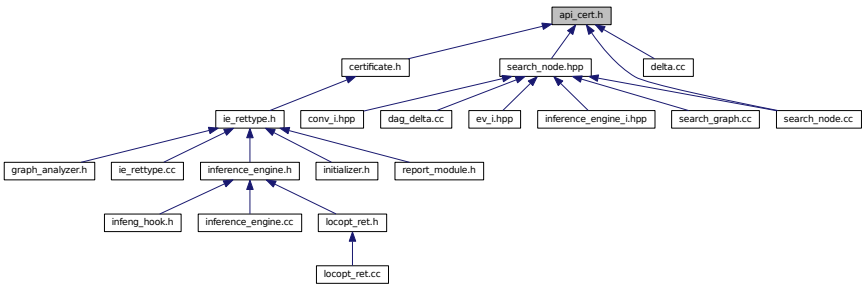
Definition in file annotation_delta.h.

11.7 api_cert.h File Reference

`#include <api_certbase.h> #include <search_node.h> #include <dbtools.-h> #include <db_method>` Include dependency graph for api_cert.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::no_certificate

  The not-certified certificate.
- class coco::split_certificate

  The certificate for deltas formed by splits.
- class coco::compound_certificate

  The certificate for deltas formed by compressing bound_delta entries.
- class coco::rigorous_module_certificate

  The certificate for deltas computed by rigorous inference engines.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

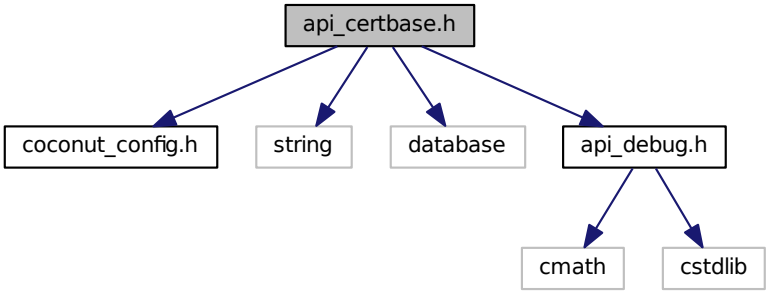
11.7.1 Detailed Description

This is an internal header file, which is not intended for use outside the API.

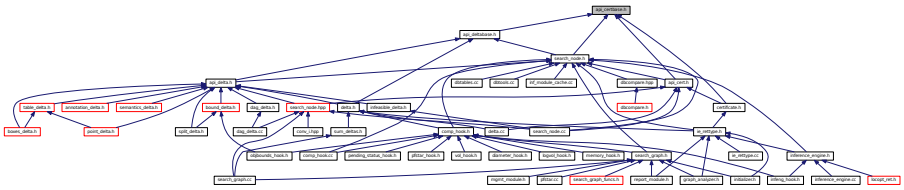
Definition in file api_cert.h.

11.8 api_certbase.h File Reference

`#include <coconut_config.h>` `#include <string>` `#include <database>` `#include <api_debug.h>` Include dependency graph for api_certbase.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::certificate_base

  Base class for the certificates.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- std::ostream & coco::operator<< (std::ostream &o, const certificate &t)

  Output Operator for certificates.

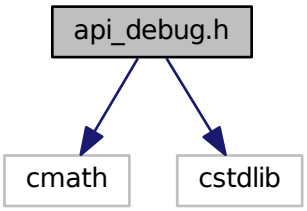
11.8.1 Detailed Description

This is an internal header file not intended for use outside the API

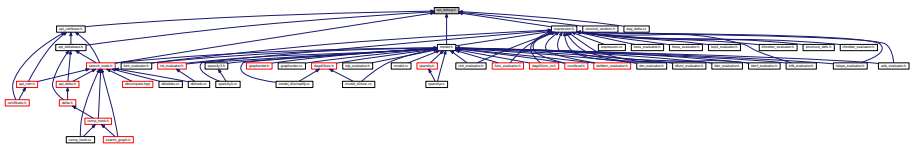
Definition in file api_certbase.h.

11.9 api_debug.h File Reference

`#include <cmath>` `#include <cstdlib>` Include dependency graph for api_debug.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco
  the main namespace of the COCONUT API

Defines

- #define DEBUG_CERTIFICATE 0
- #define DEBUG_DELTA 0
- #define __DEBUG_DAG_DELTA 0
- #define DEBUG_RANDOM 0
- #define DEBUG_EXPRESSIONS 0
- #define DEBUG_SEARCH_NODE 0
- #define MODEL_INLINE_DEBUG 0
- #define MODEL_INLINE_DEBUG_SIMPLIFY 0

11.9.1 Detailed Description

Definition in file api_debug.h.

11.9.2 Define Documentation

11.9.2.1 #define __DEBUG_DAG_DELTA 0

Definition at line 45 of file api_debug.h.

11.9.2.2 #define DEBUG_CERTIFICATE 0

Definition at line 37 of file api_debug.h.

11.9.2.3 #define DEBUG_DELTA 0

Definition at line 41 of file api_debug.h.

11.9.2.4 #define DEBUG_EXPRESSIONS 0

Definition at line 53 of file api_debug.h.

11.9.2.5 #define DEBUG_RANDOM 0

Definition at line 49 of file api_debug.h.

11.9.2.6 #define DEBUG_SEARCH_NODE 0

Definition at line 57 of file api_debug.h.

11.9.2.7 #define MODEL_INLINE_DEBUG 0

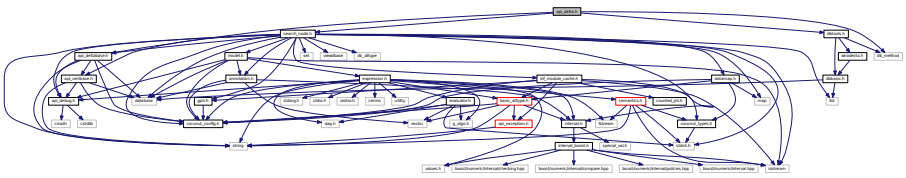
Definition at line 61 of file api_debug.h.

11.9.2.8 #define MODEL_INLINE_DEBUG_SIMPLIFY 0

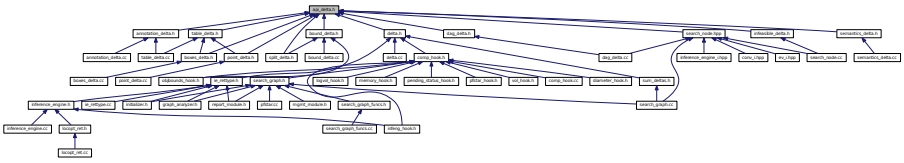
Definition at line 65 of file api_debug.h.

11.10 api_delta.h File Reference

`#include <api_deltabase.h>` `#include <search_node.h>` `#include <dbtools.-h>` `#include <db_method>` Include dependency graph for api_delta.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::delta_get_action

  Stored procedure class for computing the delta action specifier.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

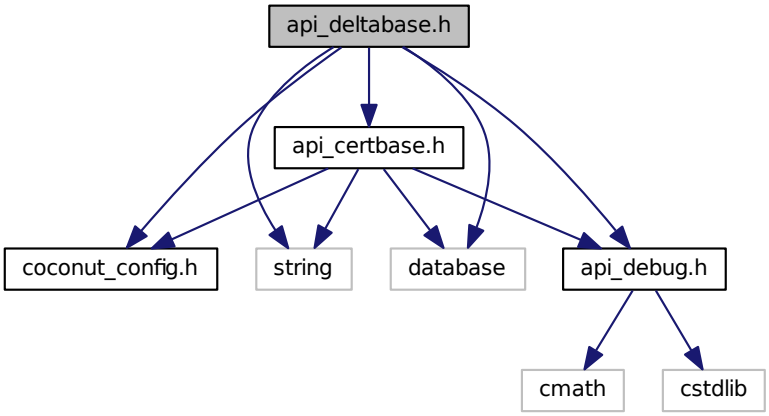
11.10.1 Detailed Description

This is an internal header file, which is not intended for use outside the API.

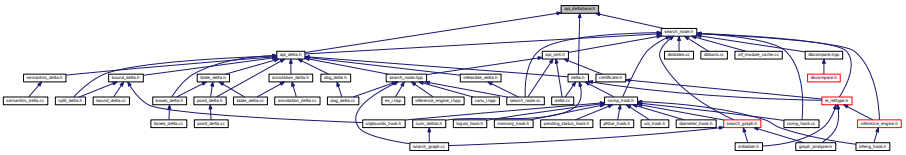
Definition in file api_delta.h.

11.11 api_deltabase.h File Reference

`#include <coconut_config.h>` `#include <string>` `#include <database>` `#include <api_certbase.h>` `#include <api_debug.h>` Include dependency graph for api_deltabase.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::delta

  The delta class (updates to work nodes)
- class coco::delta_base

  Base class for the deltas.
- class coco::undelta

  The undelta class (undo of updates to work nodes)
- class coco::undelta_base

  Base class for the undeltas.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

- typedef vdbl::rowid coco::delta_id

  The class for delta ids.

Functions

- std::ostream & coco::operator<< (std::ostream &o, const delta &t)

  Output Operator for deltas.

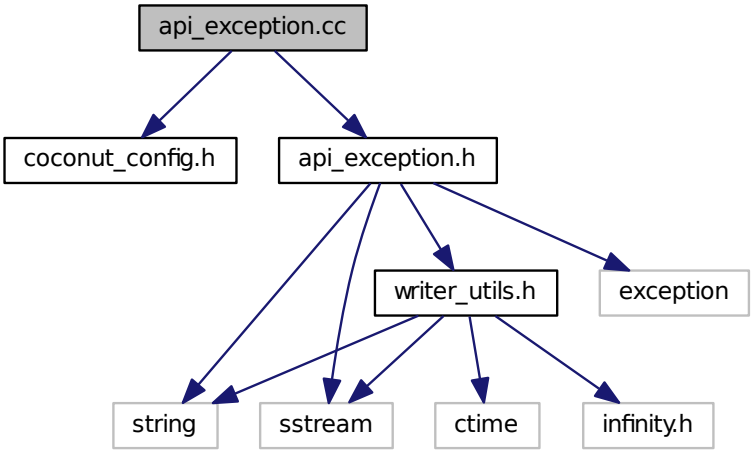
11.11.1 Detailed Description

This is an internal header file not intended for use outside the API

Definition in file api_deltabase.h.

11.12 api_exception.cc File Reference

`#include <coconut_config.h>` `#include <api_exception.h>` Include dependency graph for api_exception.cc:



Namespaces

- namespace coco

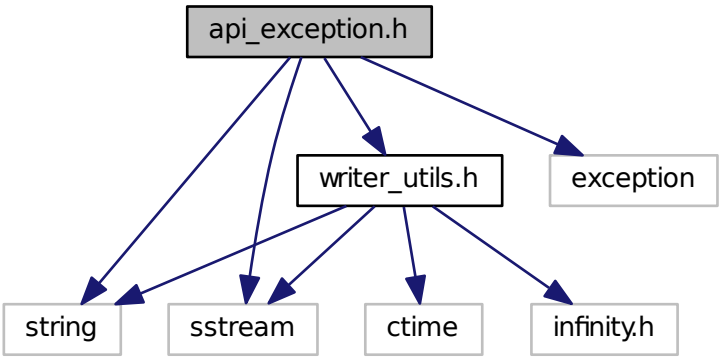
  the main namespace of the COCONUT API

11.12.1 Detailed Description

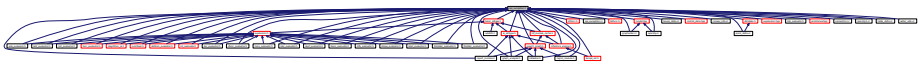
Definition in file api_exception.cc.

11.13 api_exception.h File Reference

`#include <string>` `#include <exception>` `#include <sstream>` `#include <writer_utils.h>` Include dependency graph for api_exception.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::api_exception

  API exception class.
- class coco::nyi_exception

  Not Yet Implemented exception class.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Enumerations

- enum coco::api_exception_type { coco::apiee_internal = 1, coco::apiee_evaluator = 2, coco::apiee_io = 3, coco::apiee_delta = 4, coco::apiee_search_graph = 5, coco::apiee_communication_data = 6, coco::apiee_inference_engine = 7, coco::apiee_graph_analyzer = 8, coco::apiee_management_module = 9, coco::apiee_initializer = 10, coco::apiee_report_module = 11, coco::apiee_oom = 12, coco::apiee_nyi = 13, coco::apiee_other = 14 }

  Enum for classifying api_exceptions.

11.13.1 Detailed Description

Definition in file api_exception.h.

11.14 api_extradocu.h File Reference

Namespaces

- namespace coco

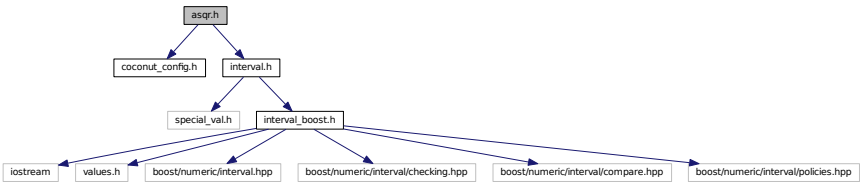
  the main namespace of the COCONUT API

11.14.1 Detailed Description

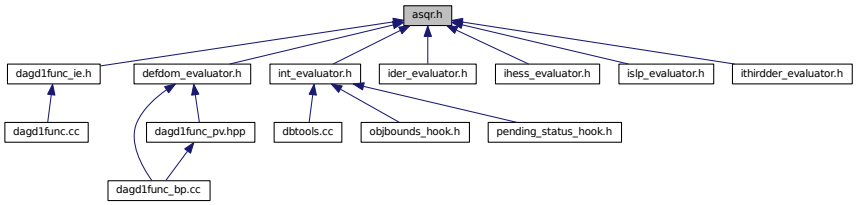
Definition in file api_extradocu.h.

11.15 asqr.h File Reference

`#include <coconut_config.h>` `#include <interval.h>` Include dependency graph for asqr.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

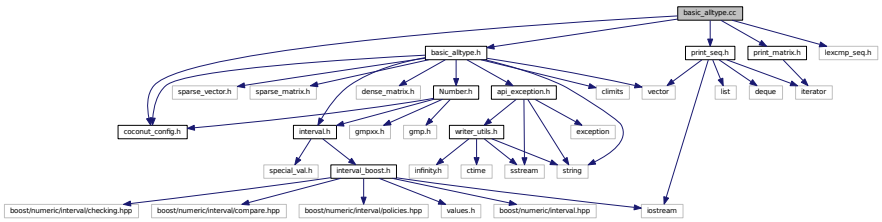
- interval coco::flb (const interval &x1, const interval &x2, const interval &x3)
- interval coco::asqr_find_f1min (const interval &c1, const interval &c3, const interval &x2)
- interval coco::eval_asqr (const interval &x1, const interval &x2, const interval &x3)

11.15.1 Detailed Description

Definition in file asqr.h.

11.16 basic_alltype.cc File Reference

`#include <coconut_config.h>` `#include <basic_alltype.h>` `#include <print-_seq.h>` `#include <print_matrix.h>` `#include <lexcmp_seq.h>` Include dependency graph for basic_alltype.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

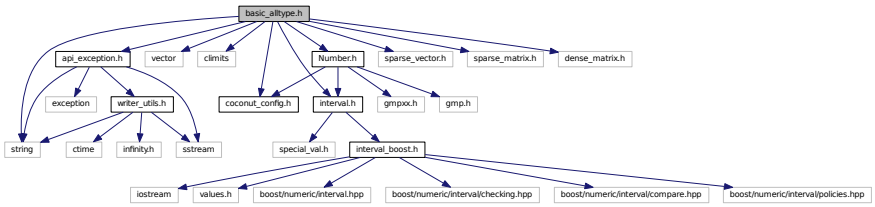
- const basic_alltype & coco::basic_alltype_empty ()
- std::ostream & coco::operator<< (std::ostream &os, const basic_alltype &b)
- bool coco::less_than (const basic_alltype &a, const basic_alltype &b)
- bool coco::less_equal (const basic_alltype &a, const basic_alltype &b)

11.16.1 Detailed Description

Definition in file basic_alltype.cc.

11.17 basic_alltype.h File Reference

`#include <string>` `#include <vector>` `#include <climits>` `#include <coconut-_config.h>` `#include <interval.h>` `#include <sparse_vector.h>` `#include <sparse-_matrix.h>` `#include <dense_matrix.h>` `#include <Number.h>` `#include <api-_exception.h>` Include dependency graph for basic_alltype.h:



This graph shows which files directly or indirectly include this file:

Classes

- class coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define BASIC_ALLTYPE_CHECK 1
- #define ALLTYPE_INTERVAL -6
- #define ALLTYPE_VOID_PTR -5
- #define ALLTYPE_DOUBLE -4

  the main namespace of the COCONUT API

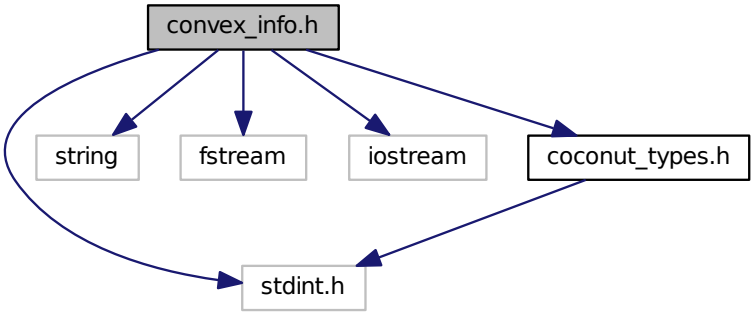
11.38.1 Detailed Description

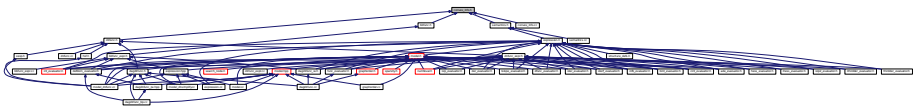
Definition in file convex_info.cc.

11.39 convex_info.h File Reference

`#include <stdint.h>` `#include <string>` `#include <fstream>` `#include <iostream>` × `#include <coconut_types.h>` Include dependency graph for convex_info.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::convex_e

  Convexity information.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Enumerations

- enum coco::convex_info { coco::c_convex = 1, coco::c_linear = 0, coco::c_concave = -1, coco::c_maybe = 2, coco::c_not = -2, coco::c_constant = 3 }

  Convexity information enum.

Functions

- bool coco::operator== (const convex_e &__c, const convex_e &__d)

  Equality comparison operator.
- bool coco::operator== (const convex_e &__c, const convex_info &__d)
- bool coco::operator== (const convex_info &__c, const convex_e &__d)
- bool coco::operator!= (const convex_e &__c, const convex_e &__d)

  Disequality comparison operator.
- bool coco::operator!= (const convex_e &__c, const convex_info &__d)
- bool coco::operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & coco::operator<< (std::ostream &o, const convex_e &__s)

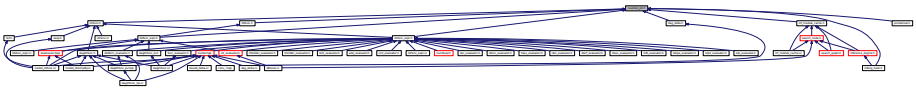
  C++ stream output operator for convex_e.

11.39.1 Detailed Description

Definition in file convex_info.h.

11.40 counted_ptr.h File Reference

This graph shows which files directly or indirectly include this file:



Classes

- class counted_ptr

11.86.2.19 #define NUM_EVALUATORS 20

number of evaluators for user defined nodes

Definition at line 59 of file eval_main.h.

11.86.2.20 #define PRINT 7

print function

Definition at line 42 of file eval_main.h.

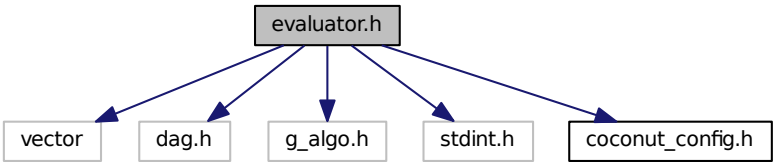
11.86.2.21 #define REDUCE_RANGE 6

function backwards reduction

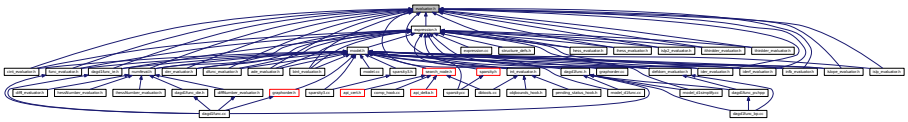
Definition at line 41 of file eval_main.h.

11.87 evaluator.h File Reference

`#include <vector>` `#include <dag.h>` `#include <g_algo.h>` `#include <stdint.-h>` `#include <coconut_config.h>` Include dependency graph for evaluator.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::variable_indicator

  Bitmap class used to indicate variable occurrence.
- class coco::_evaluator_base

  Base class of all evaluators.
- class coco::evaluator_base

  Base class of all (non-caching) evaluators.
- class coco::cached_evaluator_base

  Base class of all caching evaluators.
- class coco::forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::backward_evaluator_base

  Base class of all (non-caching) backward evaluators.
- class coco::cached_forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::cached_backward_evaluator_base

  Base class of all caching backward evaluators.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts.
- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::_recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts (internal)
- template<class _Visitor , class _Walker >
  _Visitor::return_value coco::evaluate (_Visitor __v, _Walker __start)

  Evaluate an evaluator on a DAG.

11.87.1 Detailed Description

Definition in file evaluator.h.

11.88 expression.cc File Reference

Operator types of standard expressions

These definitions define the standard operator types for the expression_node class. In the operator descriptions y_i is used for the value of the ith child of the node, while $x_i = c_i y_i$ stands for the value of the ith child of the node multiplied by the ith entry of the `coeffs` *array.*

  the main namespace of the COCONUT API

Functions

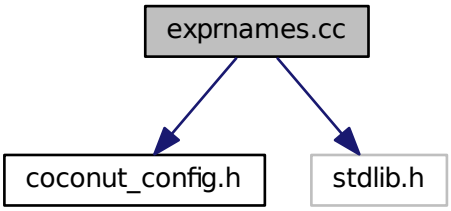
- std::ostream & coco::__wr_interval (std::ostream &o, const interval &__i)

11.90.1 Detailed Description

Definition in file expression.hpp.

11.91 exprnames.cc File Reference

`#include <coconut_config.h>` `#include <stdlib.h>` Include dependency graph for exprnames.cc-
:



Namespaces

- namespace coco

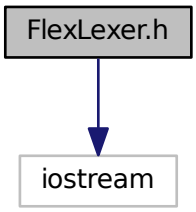
  the main namespace of the COCONUT API

11.91.1 Detailed Description

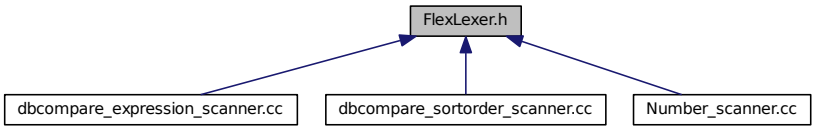
Definition in file exprnames.cc.

11.92 FlexLexer.h File Reference

`#include <iostream>` Include dependency graph for FlexLexer.h:



This graph shows which files directly or indirectly include this file:



Classes

- class FlexLexer
- class yyFlexLexer

Defines

- #define FLEX_STD std::
- #define yyFlexLexerOnce

Typedefs

- typedef int yy_state_type

11.92.1 Define Documentation

11.92.1.1 #define FLEX_STD std::

Definition at line 53 of file FlexLexer.h.

11.92.1.2 #define yyFlexLexerOnce

Definition at line 108 of file FlexLexer.h.

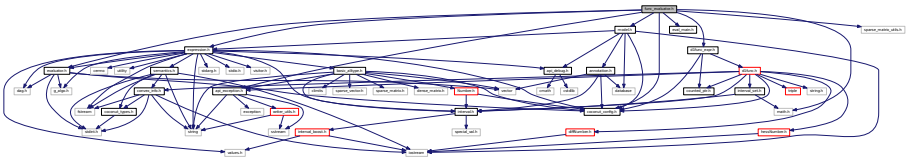
11.92.2 Typedef Documentation

11.92.2.1 typedef int yy_state_type

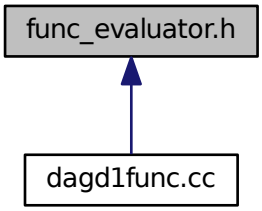
Definition at line 58 of file FlexLexer.h.

11.93 func_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <model.h>` `#include <eval_main.h>` `#include <math.h>` `#include <d1func_expr.h>` `#include <api_exception.h>` `#include <sparse_matrix_utils.-h>` Include dependency graph for func_evaluator.h:



This graph shows which files directly or indirectly include this file:



Classes

- struct coco::func_eval_type

  Visitor data for func_eval.
- class coco::func_eval

  Forward function evaluation.

Namespaces

- namespace coco

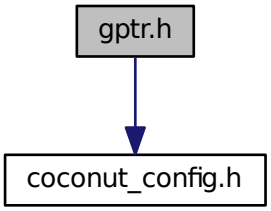
  the main namespace of the COCONUT API

11.93.1 Detailed Description

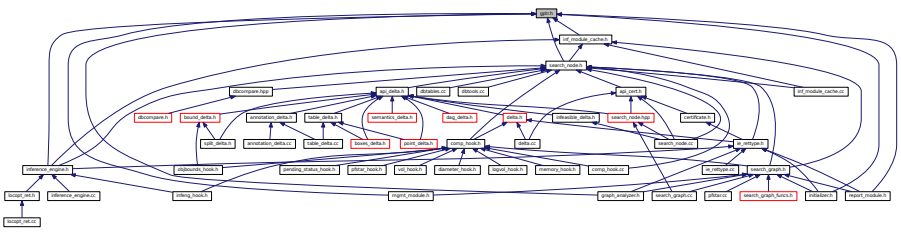
Definition in file func_evaluator.h.

11.94 gptr.h File Reference

`#include <coconut_config.h>` Include dependency graph for gptr.h:



This graph shows which files directly or indirectly include this file:



Classes

- class gptr

  Global pointer class.
- class ptr

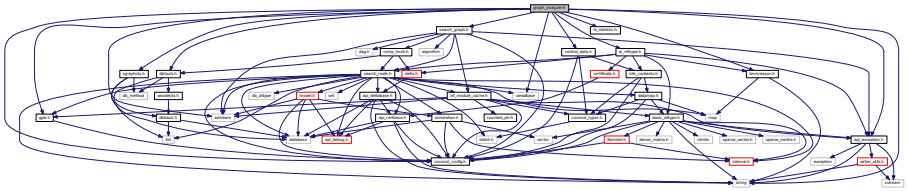
  Local global pointer class.

11.94.1 Detailed Description

Definition in file gptr.h.

11.95 graph_analyzer.h File Reference

`#include <iostream>` `#include <coconut_config.h>` `#include <search_graph.h>` `#include <termreason.h>` `#include <gptr.h>` `#include <string>` `#include <dbtools.h>` `#include <viewdbase>` `#include <ie_statistic.h>` `#include <control_data.h>` `#include <ie_rettype.h>` `#include <sgraphctx.h>` `#include <api_exception.h>` Include dependency graph for graph_analyzer.h:



Classes

- class coco::graph_analyzer_exception

  Graph analyzer exception class.
- class coco::graph_analyzer

  Graph analyzer base class.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

- typedef ie_return_type coco::ga_return_type

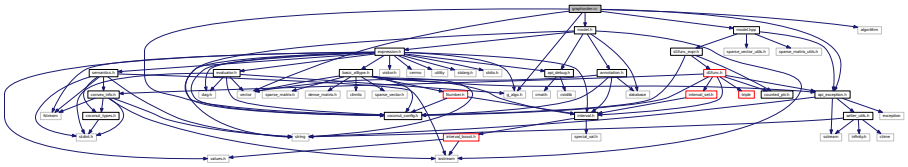
  Graph analyzer return type.

11.95.1 Detailed Description

Definition in file graph_analyzer.h.

11.96 graphorder.cc File Reference

`#include <coconut_config.h>` `#include <model.h>` `#include <vector>` `#include <algorithm>` `#include <g_algo.h>` `#include <api_exception.h>` `#include <model.hpp>` Include dependency graph for graphorder.cc:



Classes

- class coco::graphorder_visitor

  This visitor class is used for computing a graph order.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- void coco::_internal_graphorder (const model &DAG, std::vector< unsigned int > &order, std::vector< unsigned int > *inv_order)
- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order)

  Compute a graph order.
- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order, std::vector< unsigned int > &inv_order)

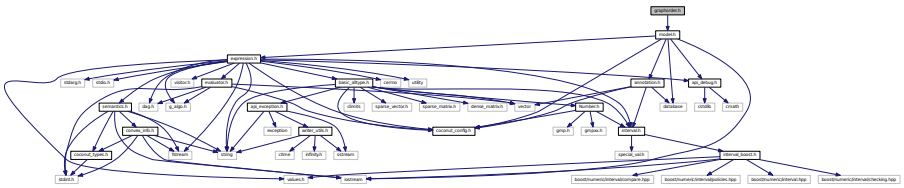
  Compute a graph order.

11.96.1 Detailed Description

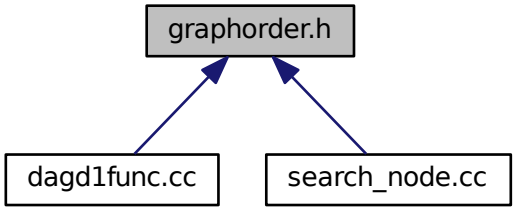
Definition in file graphorder.cc.

11.97 graphorder.h File Reference

`#include <model.h>` Include dependency graph for graphorder.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order)

  Compute a graph order.
- void coco::graphorder (const model &DAG, std::vector< unsigned int > &order, std::vector< unsigned int > &inv_order)

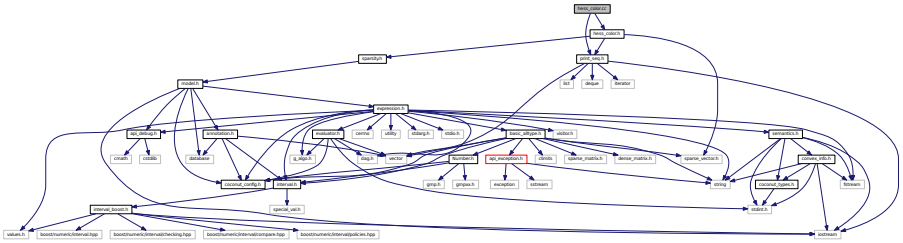
  Compute a graph order.

11.97.1 Detailed Description

Definition in file graphorder.h.

11.98 hess_color.cc File Reference

`#include <hess_color.h>` `#include <print_seq.h>` Include dependency graph for hess-_color.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define HESS_COLOR_DEBUG 0

Functions

- void coco::hess_star_color1 (const unsigned int n, const vmtl::sparse_matrix< int > &H, std::vector< std::vector< unsigned int > > &parts, std::vector< vmtl::sparse_vector< unsigned int > > &pro-vides)

11.98.1 Detailed Description

Definition in file hess_color.cc.

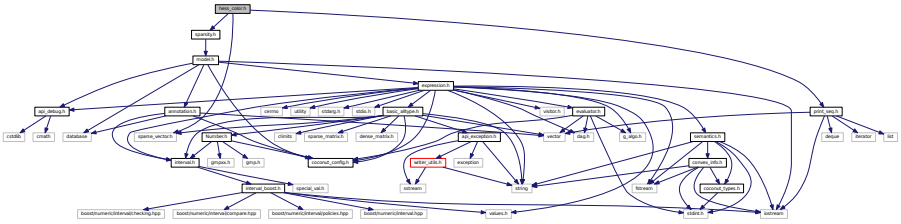
11.98.2 Define Documentation

11.98.2.1 #define HESS_COLOR_DEBUG 0

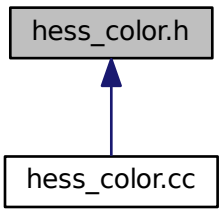
Definition at line 33 of file hess_color.cc.

11.99 hess_color.h File Reference

`#include <sparsity.h> #include <sparse_vector.h> #include <print_seq.-h>` Include dependency graph for hess_color.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define HESS_VEC_THRESHOLD 0.9

Functions

- void coco::hess_star_color1 (const unsigned int n, const vmtl::sparse_matrix< int > &H, std::vector< std::vector< unsigned int > > &parts, std::vector< vmtl::sparse_vector< unsigned int > > &provides)

11.99.1 Detailed Description

Definition in file hess_color.h.

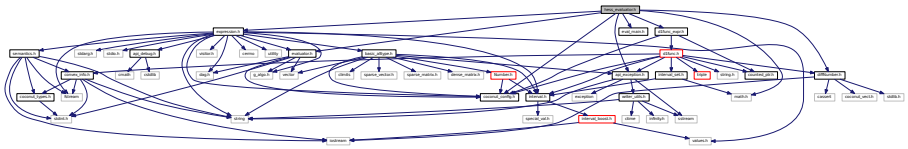
11.99.2 Define Documentation

11.99.2.1 #define HESS_VEC_THRESHOLD 0.9

Definition at line 40 of file hess_color.h.

11.100 hess_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <eval_main.h>` `#include <math.h>` `#include <api_exception.h>` × `#include <d1func_expr.h>` `#include <diffNumber.h>` Include dependency graph for hess-_evaluator.h:



Classes

- struct coco::hessPreparationEvaluatorType
- class coco::hessPreparationEvaluator
- struct coco::hessForwardEvaluatorReturnValue
- struct coco::hessForwardEvaluatorType
- class coco::hessForwardEvaluator
- struct coco::hessBackwardEvaluatorType
- class coco::hessBackwardEvaluator

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define DEBUG_HESS_EVALUATOR 0
- #define DEBUG_FHE_LIST_NODES_WITH_PARAMETERS 0

11.100.1 Detailed Description

Definition in file hess_evaluator.h.

11.100.2 Define Documentation

11.100.2.1 #define DEBUG_FHE_LIST_NODES_WITH_PARAMETERS 0

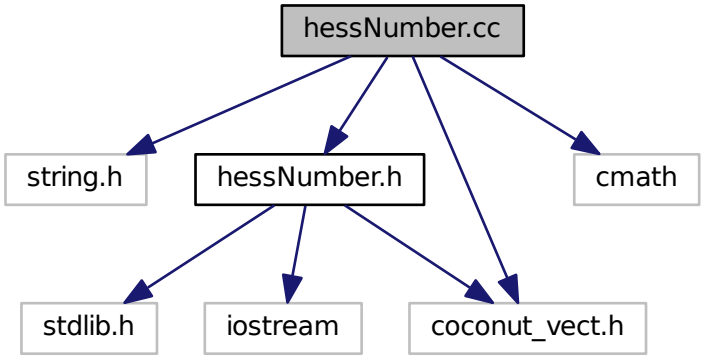
Definition at line 31 of file hess_evaluator.h.

11.100.2.2 #define DEBUG_HESS_EVALUATOR 0

Definition at line 30 of file hess_evaluator.h.

11.101 hessNumber.cc File Reference

`#include <string.h>` `#include <hessNumber.h>` `#include <coconut_vect.h>` × `#include <cmath>` Include dependency graph for hessNumber.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

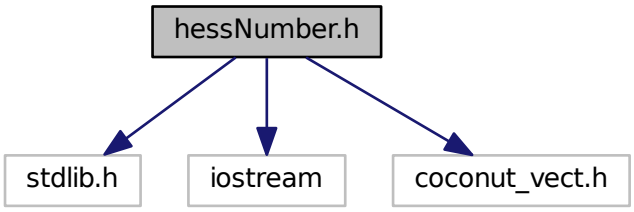
Functions

- hessNumber coco::operator∗ (const hessNumber &a, const hessNumber &b)
- hessNumber coco::operator/ (const hessNumber &a, const hessNumber &b)

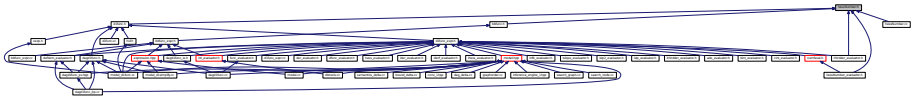
- hessNumber coco::operator/ (const double &a, const hessNumber &b)
- hessNumber coco::exp (const hessNumber &a)
- hessNumber coco::sin (const hessNumber &a)
- hessNumber coco::cos (const hessNumber &a)
- hessNumber coco::sqrt (const hessNumber &a)
- hessNumber coco::abs (const hessNumber &a)
- hessNumber coco::power (const hessNumber &a, int n)
- hessNumber coco::pow (const hessNumber &a, const hessNumber &b)
- hessNumber coco::log (const hessNumber &a)
- hessNumber coco::sinh (const hessNumber &a)
- hessNumber coco::cosh (const hessNumber &a)
- hessNumber coco::atan2 (const hessNumber &a, const hessNumber &b)
- hessNumber coco::atan (const hessNumber &a)
- hessNumber coco::square (const hessNumber &a)
- std::ostream & coco::operator<< (std::ostream &s, const hessNumber &a)

11.102 hessNumber.h File Reference

`#include <stdlib.h>` `#include <iostream>` `#include <coconut_vect.h>` Include dependency graph for hessNumber.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::hessNumber

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- hessNumber coco::operator+ (const hessNumber &a, const hessNumber &b)
- hessNumber coco::operator+ (const double &a, const hessNumber &b)
- hessNumber coco::operator+ (const hessNumber &a, const double &b)
- hessNumber coco::operator- (const hessNumber &a, const hessNumber &b)
- hessNumber coco::operator- (const double &a, const hessNumber &b)
- hessNumber coco::operator- (const hessNumber &a, const double &b)

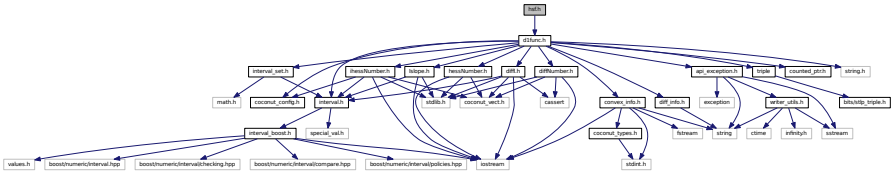
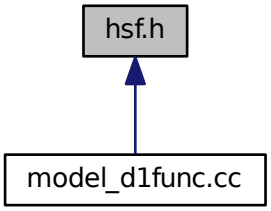
Definition at line 40 of file hessNumber_evaluator.h.

11.104 hsf.h File Reference

`#include <d1func.h>` Include dependency graph for hsf.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::hsf_func

  The hsf_func class (one dimensional function)

Namespaces

- namespace coco

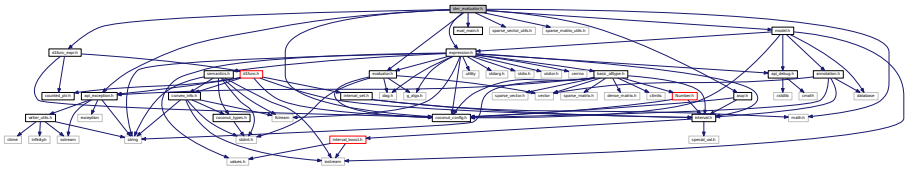
  the main namespace of the COCONUT API

11.104.1 Detailed Description

Definition in file hsf.h.

11.105 ider_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.h>` `#include <model.h>` `#include <eval_main.h>` `#include <sparse_vector_utils.h>` `#include <sparse_matrix_utils.h>` `#include <math.h>` `#include <api_exception.h>` `#include <d1func_expr.h>` `#include <asqr.h>` Include dependency graph for ider_evaluator.h:



Classes

- class coco::prep_id_eval

  Preparation Evaluator for interval derivatives.
- struct coco::func_id_eval_type

  Visitor data for func_id_eval.
- class coco::func_id_eval

  Forward function range evaluation with preparation of interval derivative data.
- struct coco::ider_eval_type

  Visitor data for ider_eval.
- class coco::ider_eval

  Backward interval gradient evaluation with prepared interval derivative data.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

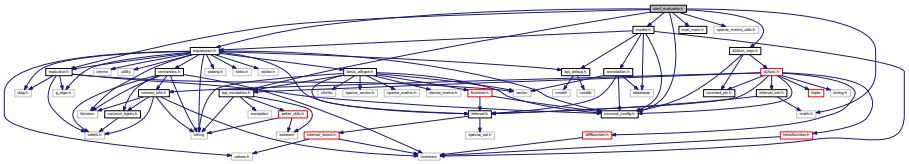
- typedef bool(∗ coco::prep_id_evaluator)()
- typedef interval(∗ coco::func_id_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v, std::vector< interval > &__id_data)
- typedef std::vector< interval > &(∗ coco::ider_evaluator)(const std::vector< interval > &__d_dat, const variable_indicator &__v)

11.105.1 Detailed Description

Definition in file ider_evaluator.h.

11.106 iderf_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <model.h>` `#include <eval_main.h>` `#include <sparse_matrix_-utils.h>` `#include <math.h>` `#include <d1func_expr.h>` `#include <api_exception.-h>` Include dependency graph for iderf_evaluator.h:



Classes

- struct coco::iderf_ret_type

  Visitor data for iderf_eval return value.
- struct coco::iderf_eval_type

  Visitor data for iderf_eval.
- class coco::iderf_eval

  Forward function and derivative range evaluation.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

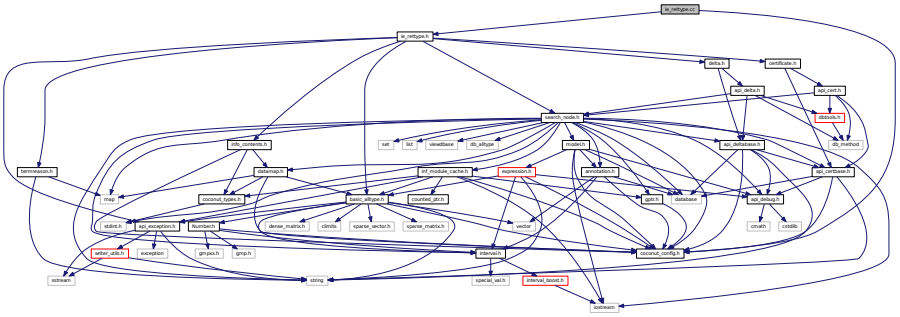
- typedef iderf_ret_type(∗ coco::iderf_evaluator)(const std::vector< interval > ∗__x, const variable-_indicator &__v)

11.106.1 Detailed Description

Definition in file iderf_evaluator.h.

11.107 ie_rettype.cc File Reference

`#include <coconut_config.h>` `#include <ie_rettype.h>` Include dependency graph for ie_rettype.cc:



Namespaces

- namespace coco

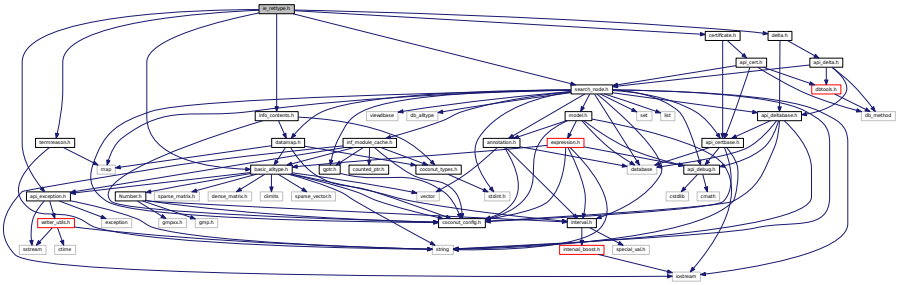
  the main namespace of the COCONUT API

11.107.1 Detailed Description

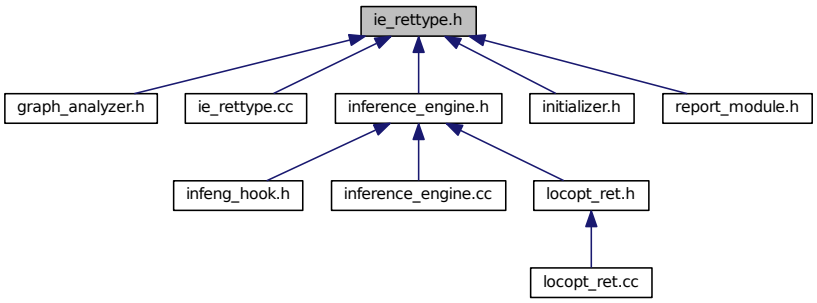
Definition in file ie_rettype.cc.

11.108 ie_rettype.h File Reference

`#include <basic_alltype.h>` `#include <termreason.h>` `#include <info_contents.h>` `#include <search_node.h>` `#include <delta.h>` `#include <api_exception.h>` `#include <certificate.h>` Include dependency graph for ie_rettype.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::ie_return_type

  The return class of all inference engines.

Namespaces

- namespace coco

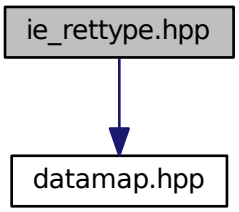
  the main namespace of the COCONUT API

11.108.1 Detailed Description

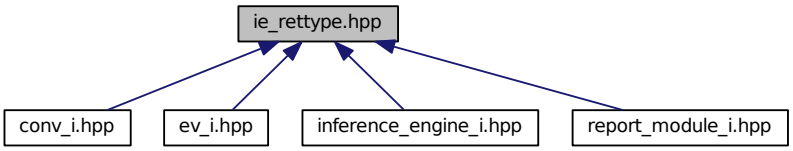
Definition in file ie_rettype.h.

11.109 ie_rettype.hpp File Reference

`#include <datamap.hpp>` Include dependency graph for ie_rettype.hpp:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco

```

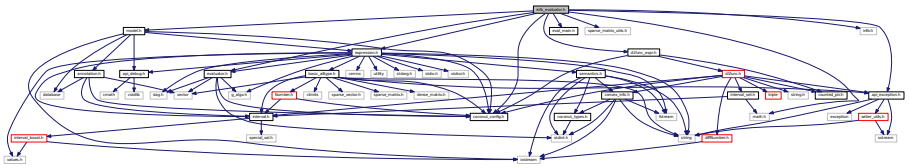
utils.h> #include <math.h> #include <infb.h> #include <d1func_expr.h> × #include <api_exception.h> Include dependency graph for infb_evaluator.h:



Classes

- struct coco::infbound_eval_type
- class coco::infbound_eval

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

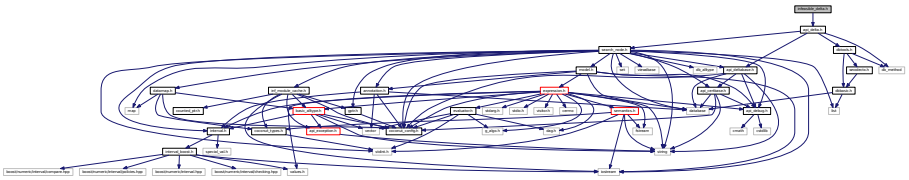
- typedef infbound(∗ coco::infbound_evaluator)(const std::vector< infbound > ∗__x, const variable_indicator &__v)

11.118.1 Detailed Description

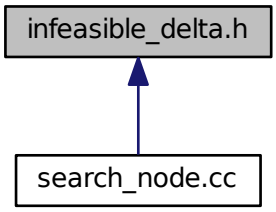
Definition in file infb_evaluator.h.

11.119 infeasible_delta.h File Reference

#include <api_delta.h> Include dependency graph for infeasible_delta.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::infeasible_undelta

  The infeasible undelta class for undoing changes to the feasibility of a model.
- class coco::infeasible_delta

  The infeasible delta class for marking a model as infeasible.

Namespaces

- namespace coco

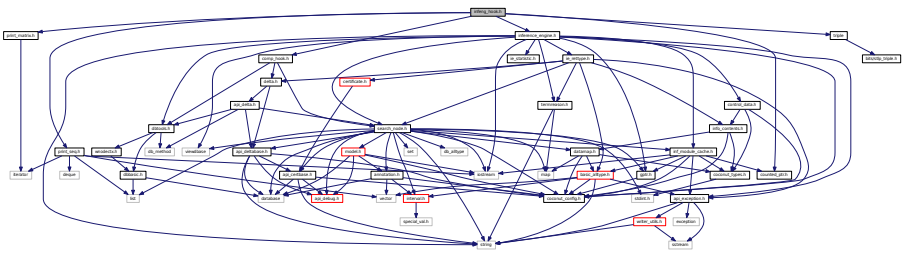
  the main namespace of the COCONUT API

11.119.1 Detailed Description

Definition in file infeasible_delta.h.

11.120 infeng_hook.h File Reference

`#include <comp_hook.h> #include <inference_engine.h> #include <triple> × #include <print_seq.h> #include <print_matrix.h> #include <counted_ptr.-h>` Include dependency graph for infeng_hook.h:



Classes

- class coco::inference_engine_comp_hook

  The inference engine meta computation hook (work node computation hook)

Namespaces

- namespace coco

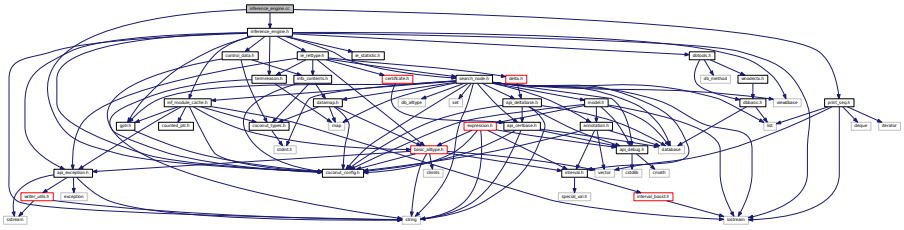
  the main namespace of the COCONUT API

11.120.1 Detailed Description

Definition in file infeng_hook.h.

11.121 inference_engine.cc File Reference

`#include <coconut_config.h>` `#include <inference_engine.h>` `#include <print-_seq.h>` Include dependency graph for inference_engine.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

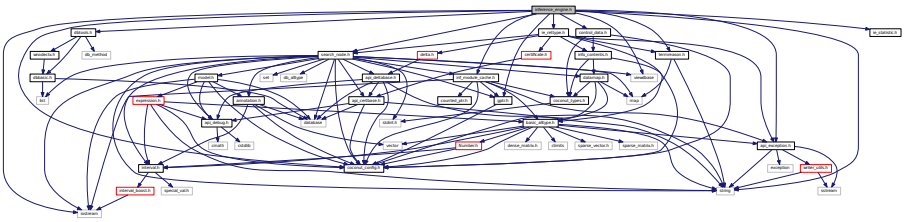
11.121.1 Detailed Description

Definition in file inference_engine.cc.

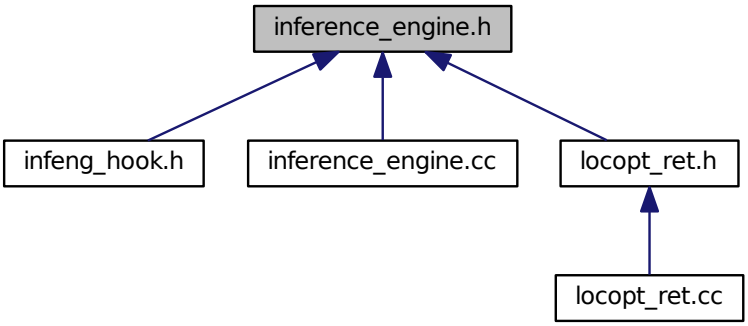
11.122 inference_engine.h File Reference

`#include <iostream>` `#include <coconut_config.h>` `#include <search_node.-h>` `#include <termreason.h>` `#include <gptr.h>` `#include <string>` `#include`

<dbtools.h> #include <viewdbase> #include <ie_statistic.h> #include <control-_data.h> #include <ie_rettype.h> #include <api_exception.h> #include <inf-_module_cache.h> Include dependency graph for inference_engine.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::inference_engine_exception
  Inference engine exception class.
- class coco::inference_engine
  Inference engine base class.

Namespaces

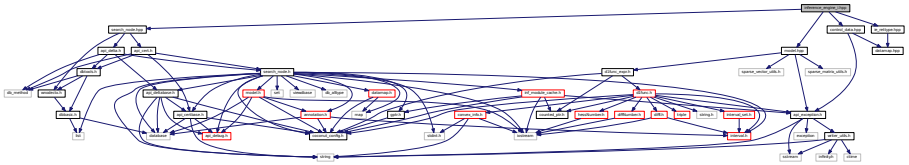
- namespace coco
  the main namespace of the COCONUT API

11.122.1 Detailed Description

Definition in file inference_engine.h.

11.123 inference_engine_i.hpp File Reference

`#include <search_node.hpp>` `#include <control_data.hpp>` `#include <ie_rettype.hpp>` `#include <model.hpp>` Include dependency graph for inference_engine_i.hpp:

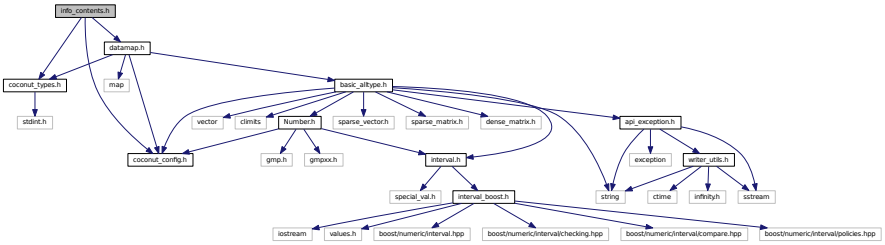


11.123.1 Detailed Description

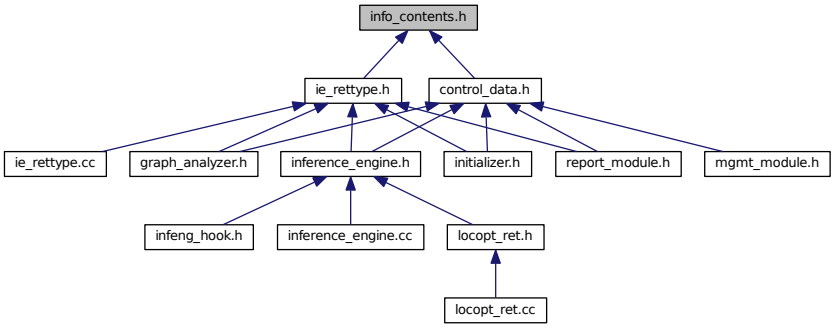
Definition in file inference_engine_i.hpp.

11.124 info_contents.h File Reference

`#include <coconut_config.h>` `#include <coconut_types.h>` `#include <datamap.h>` Include dependency graph for info_contents.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::info_contents

  The class for returning additional information from inference modules.

Namespaces

- namespace coco

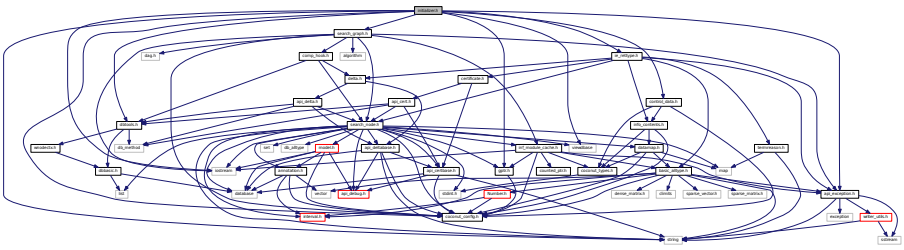
  the main namespace of the COCONUT API

11.124.1 Detailed Description

Definition in file info_contents.h.

11.125 initializer.h File Reference

`#include <iostream> #include <coconut_config.h> #include <search_graph.-h> #include <gptr.h> #include <string> #include <dbtools.h> #include <viewdbase> × #include <control_data.h> #include <ie_rettype.h> #include <api_exception.-h>` Include dependency graph for initializer.h:



Classes

- class coco::initializer_exception

  Initializer exception class.
- class coco::initializer

  Initializer base class.

Namespaces

- namespace coco

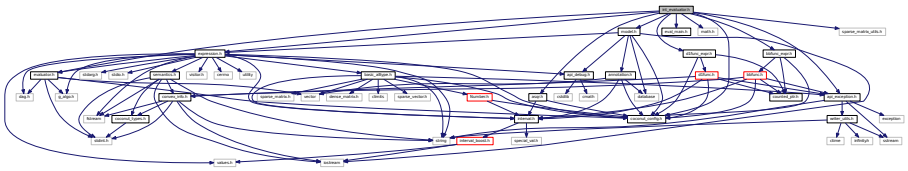
  the main namespace of the COCONUT API

11.125.1 Detailed Description

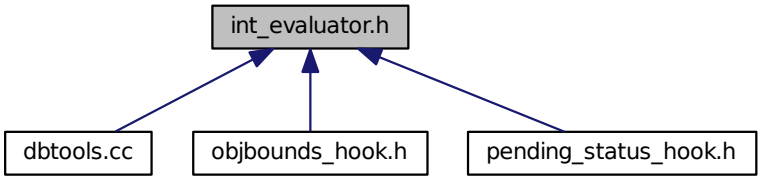
Definition in file initializer.h.

11.126 int_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <model.h>` `#include <eval_main.h>` `#include <math.h>` `#include <api_exception.h>` `#include <d1func_expr.h>` `#include <bbfunc_expr.h>` `#include <asqr.h>` `#include <sparse_matrix_utils.h>` Include dependency graph for int_evaluator.h-:



This graph shows which files directly or indirectly include this file:



Classes

- struct coco::interval_eval_type

  Visitor data for interval_eval.
- class coco::interval_eval

  Forward function range evaluation.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Typedefs

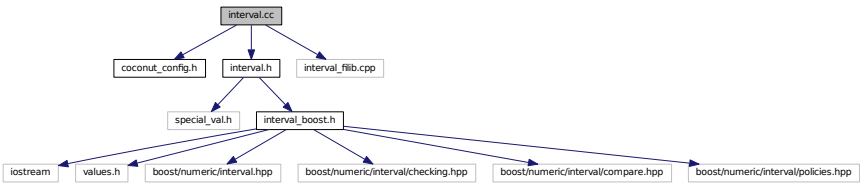
- typedef interval(∗ coco::interval_evaluator)(const std::vector< interval > ∗__x, const variable_indicator &__v)

11.126.1 Detailed Description

Definition in file int_evaluator.h.

11.127 interval.cc File Reference

`#include <coconut_config.h> #include <interval.h> #include <interval_filib.cpp>` Include dependency graph for interval.cc:

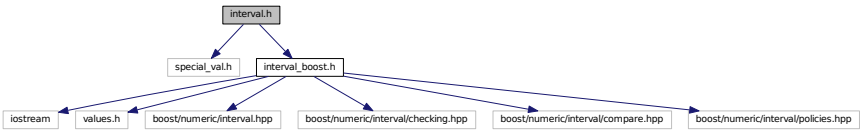


11.127.1 Detailed Description

Definition in file interval.cc.

11.128 interval.h File Reference

`#include <special_val.h>` `#include <interval_boost.h>` Include dependency graph for interval.h:



This graph shows which files directly or indirectly include this file:

11.128.1 Detailed Description

Definition in file interval.h.

11.128.2 Define Documentation

11.128.2.1 #define get_integer(x) ((int) rint((x)))

11.128.2.2 #define get_integer(x) ((int) rint((x)))

11.128.2.3 #define get_integer(x) ((int) rint((x)))

11.128.2.4 #define get_integer(x) ((int) rint((x)))

11.128.2.5 #define get_integer(x) ((int) rint((x)))

11.128.2.6 #define get_integer(x) ((int) rint((x)))

11.128.2.7 #define get_integer(x) ((int) rint((x)))

11.128.2.8 #define get_integer(x) ((int) rint((x)))

11.128.2.9 #define get_integer(x) ((int) rint((x)))

This macro returns the integer part of a double (as integer).

Definition at line 57 of file search_graph.cc.

11.128.2.10 #define get_integer(x) ((int) rint((x)))

11.128.2.11 #define get_integer(x) ((int) rint((x)))

11.128.2.12 #define get_integer(x) ((int) rint((x)))

11.128.2.13 #define get_integer(x) ((int) rint((x)))

11.128.2.14 #define get_integer(x) ((int) rint((x)))

11.128.2.15 #define get_integer(x) ((int) rint((x)))

11.128.2.16 #define is_integer(x) (rint((x)) == (x) && rint((x)) < MAXINT && rint((x)) > -MAXINT)

11.128.2.17 #define is_integer(x) (rint((x)) == (x) && rint((x)) < MAXINT && rint((x)) > -MAXINT)

11.128.2.18 #define is_integer(x) (rint((x)) == (x) && rint((x)) < MAXINT && rint((x)) > -MAXINT)

This macro checks whether a double number represents an integer.

Definition at line 53 of file search_graph.cc.

11.128.2.19 #define is_integer(x) (rint((x)) == (x) && rint((x)) < MAXINT && rint((x)) > -MAXINT)

- Islope sin (const Islope &a)
- Islope cos (const Islope &a)
- Islope sqr (const Islope &a)
- Islope sqrt (const Islope &a)
- Islope pow (const Islope &a, const Islope &b)
- Islope power (const Islope &a, int n)
- Islope log (const Islope &a)

- Islope atan (const Islope &a)
- Islope atan2 (const Islope &a, const Islope &b)

11.134.1 Typedef Documentation

11.134.1.1 typedef interval I

Definition at line 7 of file Islope.cc.

11.134.2 Function Documentation

11.134.2.1 Islope atan (const Islope & *a*)

Used to compute the slope for the function atan(x) for a given x.

Definition at line 933 of file Islope.cc.

11.134.2.2 Islope atan2 (const Islope & *a*, const Islope & *b*)

Used to compute the slope for the function atan2(x) for a given x.

Definition at line 1022 of file Islope.cc.

11.134.2.3 Islope cos (const Islope & *a*)

Used to compute the slope for the function cos(x) for a given x.

Definition at line 308 of file Islope.cc.

11.134.2.4 Islope exp (const Islope & *a*)

Used to compute the slope for the function exp(x) for a given x.

Definition at line 14 of file Islope.cc.

11.134.2.5 Islope log (const Islope & *a*) [inline]

Used to compute the slope for the function log(x) for a given x.

Definition at line 848 of file Islope.cc.

11.134.2.6 Islope pow (const Islope & *a*, const Islope & *b*)

Used to compute the slope for the function pow(x,y) for given x, y.

Definition at line 593 of file Islope.cc.

11.134.2.7 Islope power (const Islope & *a*, int *n*)

Used to compute the slope for the function power(x,n) for a given x.

Definition at line 607 of file Islope.cc.

11.134.2.8 Islope sin (const Islope & *a*)

Used to compute the slope for the function sin(x) for a given x.

Definition at line 95 of file Islope.cc.

11.134.2.9 Islope sqr (const Islope & *a*)

Used to compute the slope for the function sqr(x) for a given x.

Definition at line 521 of file Islope.cc.

11.134.2.10 Islope sqrt (const Islope & *a*)

Used to compute the slope for the function sqrt(x) for a given x.

Definition at line 551 of file Islope.cc.

11.135 Islope.h File Reference

`#include "interval.h"` `#include <stdlib.h>` `#include <iostream>` Include dependency graph for Islope.h:

- Islope atan (const Islope &a)
- Islope atan2 (const Islope &a, const Islope &b)

11.135.1 Typedef Documentation

11.135.1.1 typedef interval I

Definition at line 10 of file Islope.h.

11.135.2 Function Documentation

11.135.2.1 Islope atan (const Islope & *a*)

Used to compute the slope for the function atan(x) for a given x.

Definition at line 933 of file Islope.cc.

11.135.2.2 Islope atan2 (const Islope & *a*, const Islope & *b*)

Used to compute the slope for the function atan2(x) for a given x.

Definition at line 1022 of file Islope.cc.

11.135.2.3 Islope cos (const Islope & *a*)

Used to compute the slope for the function cos(x) for a given x.

Definition at line 308 of file Islope.cc.

11.135.2.4 Islope exp (const Islope & *a*)

Used to compute the slope for the function exp(x) for a given x.

Definition at line 14 of file Islope.cc.

11.135.2.5 Islope log (const Islope & *a*) [inline]

Used to compute the slope for the function log(x) for a given x.

Definition at line 848 of file Islope.cc.

11.135.2.6 Islope operator∗ (const Islope & *a*, const Islope & *b*) [inline]

Operator ∗. Multiplicates slope a with slope b.

Definition at line 653 of file Islope.h.

11.135.2.7 Islope operator∗ (const double & *a*, const Islope & *b*) [inline]

Operator ∗. Multiplicates double a with slope b.

Definition at line 689 of file Islope.h.

11.135.2.8 Islope operator∗ (const Islope & *a*, const double & *b*) [inline]

Operator ∗. Multiplicates slope a with double b.

Definition at line 716 of file Islope.h.

11.135.2.9 Islope operator+ (const Islope & *a*, const Islope & *b*) [inline]

Operator +. Adds slope a and b.

Definition at line 446 of file Islope.h.

11.135.2.10 Islope operator+ (const double & *a*, const Islope & *b*) [inline]

Operator +. Adds slope b and double a.

Definition at line 482 of file Islope.h.

11.135.2.11 Islope operator+ (const Islope & *a*, const double & *b*) [inline]

Operator +. Adds slope a and double b.

Definition at line 509 of file Islope.h.

11.135.2.12 Islope operator- (const Islope & *a*, const Islope & *b*) [inline]

Operator -. Subtracts slope b from slope a.

Definition at line 536 of file Islope.h.

11.135.2.13 Islope operator- (const double & *a*, const Islope & *b*) [inline]

Operator -. Subtracts slope b from daouble a.

Definition at line 572 of file Islope.h.

11.135.2.14 Islope operator- (const Islope & *a*, const double & *b*) [inline]

Operator -. Subtracts double b from slope a.

Definition at line 599 of file Islope.h.

11.135.2.15 Islope operator- (const Islope & *a*) [inline]

Operator -. Changes sign of slope a.

Definition at line 626 of file Islope.h.

11.135.2.16 Islope operator/ (const Islope & *a*, const Islope & *b*) [inline]

Operator /. Divides the slope a by slope b.

Definition at line 758 of file Islope.h.

11.135.2.17 Islope operator/ (const double & *a*, const Islope & *b*) [inline]

Operator /. Divides the double a by slope b.

Definition at line 743 of file Islope.h.

11.135.2.18 Islope operator/ (const Islope & *a*, const double & *b*) [inline]

Operator /. Divides the slope a by double b.

Definition at line 790 of file Islope.h.

11.135.2.19 std::ostream& operator<< (std::ostream & *s*, const Islope & *a*)

The operator for ouput. Shows the range of the function, the functionvalue of the middle point and the slopeinterval. If the slope has order 2 the functionvalue of the first derivative of the function at the middle-point and the slopeinterval of order 2 are also shown.

11.135.2.20 Islope pow (const Islope & *a*, const Islope & *b*)

Used to compute the slope for the function pow(x,y) for given x, y.

Definition at line 593 of file Islope.cc.

11.135.2.21 Islope power (const Islope & *a*, int *n*)

Used to compute the slope for the function power(x,n) for a given x.

Definition at line 607 of file Islope.cc.

11.135.2.22 Islope sin (const Islope & *a*)

Used to compute the slope for the function sin(x) for a given x.

Definition at line 95 of file Islope.cc.

11.135.2.23 Islope sqr (const Islope & *a*)

Used to compute the slope for the function sqr(x) for a given x.

Definition at line 521 of file Islope.cc.

11.135.2.24 Islope sqrt (const Islope & *a*)

Used to compute the slope for the function sqrt(x) for a given x.

Definition at line 551 of file Islope.cc.

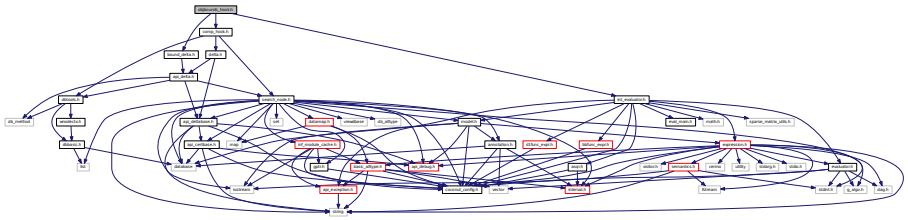
11.160 objbounds_hook.h File Reference

`#include <comp_hook.h>` `#include <int_evaluator.h>` `#include <bound_delta.-h>` Include dependency graph for objbounds_hook.h:



Classes

- class coco::objbounds_comp_hook

  The objective-bounds computation hook (work node computation hook)

Namespaces

- namespace coco

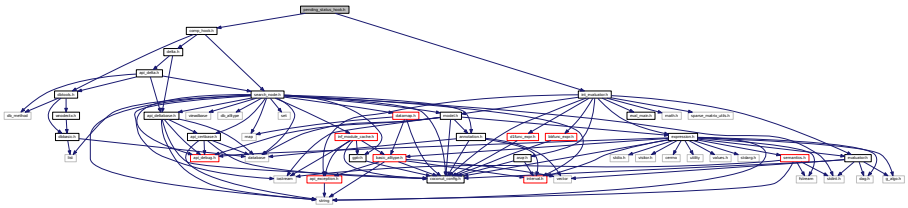
  the main namespace of the COCONUT API

11.160.1 Detailed Description

Definition in file objbounds_hook.h.

11.161 pending_status_hook.h File Reference

`#include <comp_hook.h>` `#include <int_evaluator.h>` Include dependency graph for pending_status_hook.h:



Classes

- class coco::pending_status_comp_hook

  The pending status computation hook (work node computation hook)

Namespaces

- namespace coco

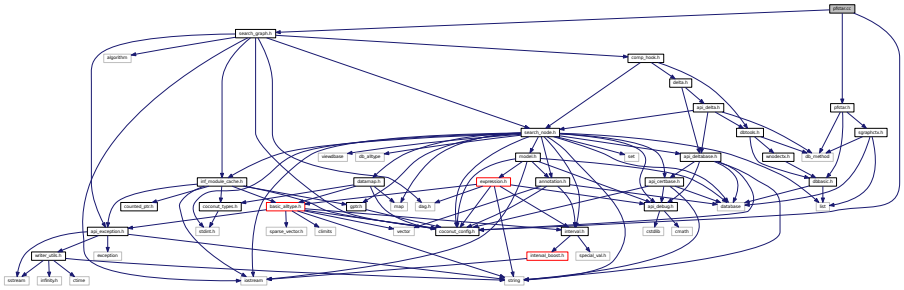
  the main namespace of the COCONUT API

11.161.1 Detailed Description

Definition in file pending_status_hook.h.

11.162 pfstar.cc File Reference

`#include <coconut_config.h>` `#include <search_graph.h>` `#include <pfstar.-h>` Include dependency graph for pfstar.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define PFSTAR_DEBUG 0

11.162.1 Detailed Description

Definition in file pfstar.cc.

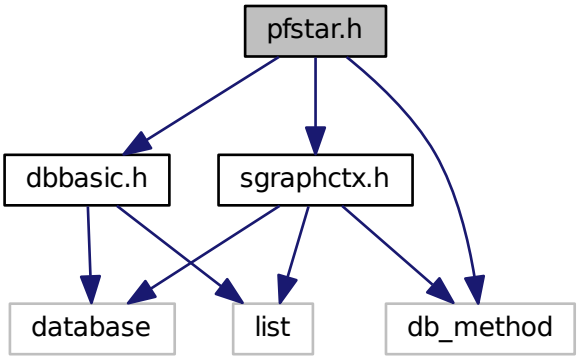
11.162.2 Define Documentation

11.162.2.1 #define PFSTAR_DEBUG 0

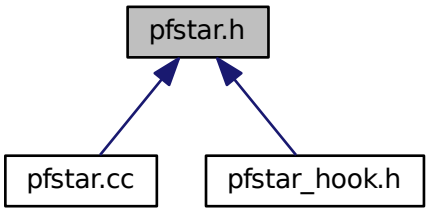
Definition at line 32 of file pfstar.cc.

11.163 pfstar.h File Reference

`#include <dbbasic.h>` `#include <db_method>` `#include <sgraphctx.h>` Include dependency graph for pfstar.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::calc_pf_star

  Stored procedure calculating the pf∗ value of a box.

Namespaces

- namespace coco

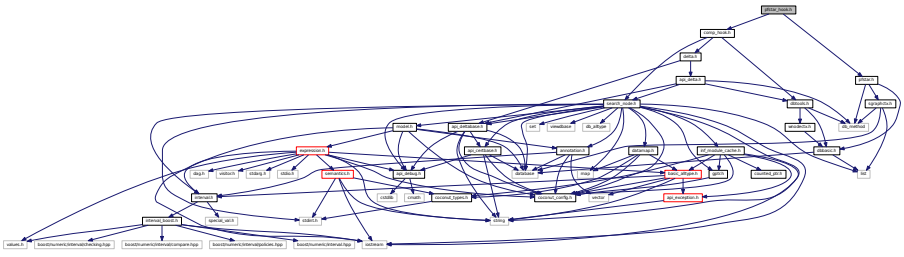
the main namespace of the COCONUT API

11.163.1 Detailed Description

Definition in file pfstar.h.

11.164 pfstar_hook.h File Reference

`#include <comp_hook.h>` `#include <pfstar.h>` Include dependency graph for pfstar_hook.h-
:



Classes

- class coco::pfstar_hook

  The pfstar computation hook (work node computation hook)

Namespaces

- namespace coco

  the main namespace of the COCONUT API

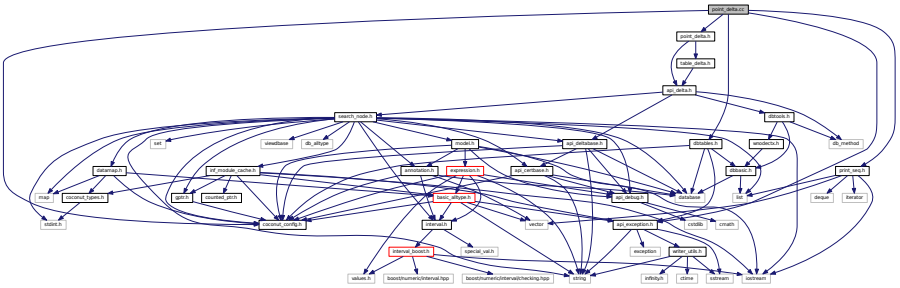
11.164.1 Detailed Description

Definition in file pfstar_hook.h.

11.165 point_delta.cc File Reference

`#include <coconut_config.h>` `#include <point_delta.h>` `#include <print_-
seq.h>` `#include <api_exception.h>` `#include <dbtables.h>` Include dependency graph

for point_delta.cc:



Namespaces

- namespace coco

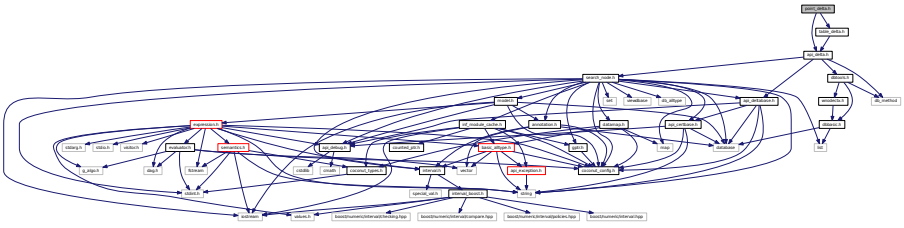
  the main namespace of the COCONUT API

11.165.1 Detailed Description

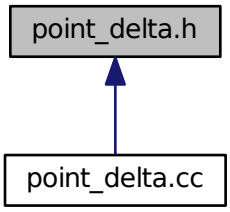
Definition in file point_delta.cc.

11.166 point_delta.h File Reference

`#include <api_delta.h>` `#include <table_delta.h>` Include dependency graph for point-_delta.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::point_delta

  A delta class which adds new points to the search database.

Namespaces

- namespace coco

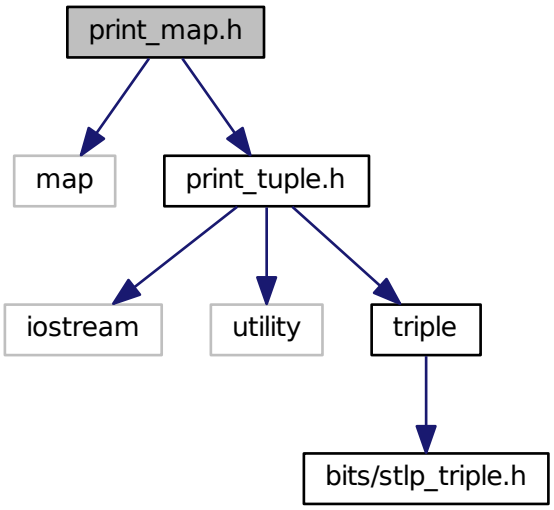
  the main namespace of the COCONUT API

11.166.1 Detailed Description

Definition in file point_delta.h.

11.167 print_map.h File Reference

`#include <map>` `#include <print_tuple.h>` Include dependency graph for print_map.h:



Namespaces

- namespace std

  The standard namespace.

Functions

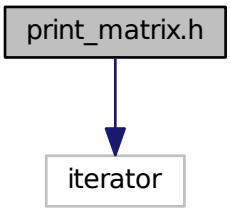
- template<typename _TK , typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const map< _TK, _Ve, _TC, _TA > &a)
- template<typename _TK , typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const multimap< _TK, _Ve, _TC, _TA > &a)

11.167.1 Detailed Description

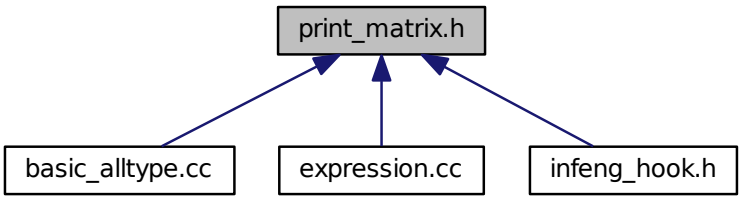
Definition in file print_map.h.

11.168 print_matrix.h File Reference

`#include <iterator>` Include dependency graph for print_matrix.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace std

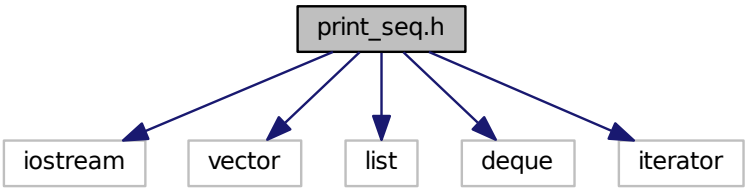
  The standard namespace.

11.168.1 Detailed Description

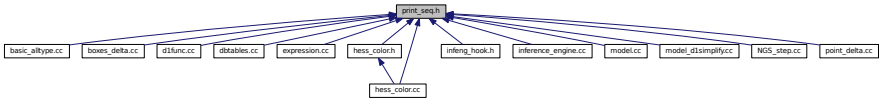
Definition in file print_matrix.h.

11.169 print_seq.h File Reference

`#include <iostream>` `#include <vector>` `#include <list>` `#include <deque>` × `#include <iterator>` Include dependency graph for print_seq.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace std

  The standard namespace.

Functions

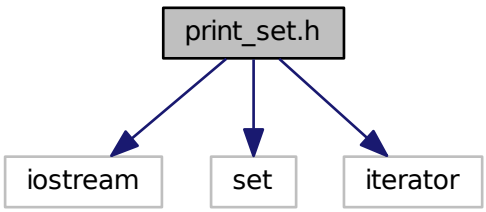
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const vector< _Ve, _TA > &a)
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const list< _Ve, _TA > &a)
- template<typename _Ve , typename _TA >
  ostream & std::operator<< (ostream &o, const deque< _Ve, _TA > &a)

11.169.1 Detailed Description

Definition in file print_seq.h.

11.170 print_set.h File Reference

`#include <iostream>` `#include <set>` `#include <iterator>` Include dependency graph for print_set.h:



Namespaces

- namespace std

  The standard namespace.

Functions

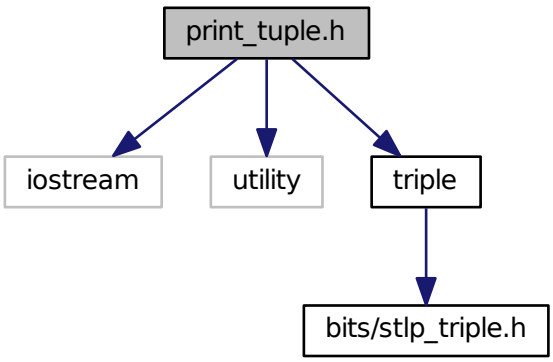
- template<typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const set< _Ve, _TC, _TA > &a)
- template<typename _Ve , typename _TC , typename _TA >
  ostream & std::operator<< (ostream &o, const multiset< _Ve, _TC, _TA > &a)

11.170.1 Detailed Description

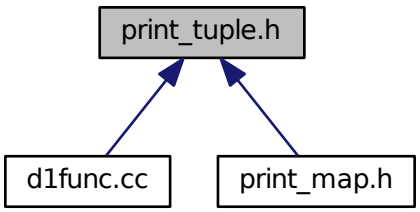
Definition in file print_set.h.

11.171 print_tuple.h File Reference

`#include <iostream>` `#include <utility>` `#include <triple>` Include dependency graph for print_tuple.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace std

  The standard namespace.

Functions

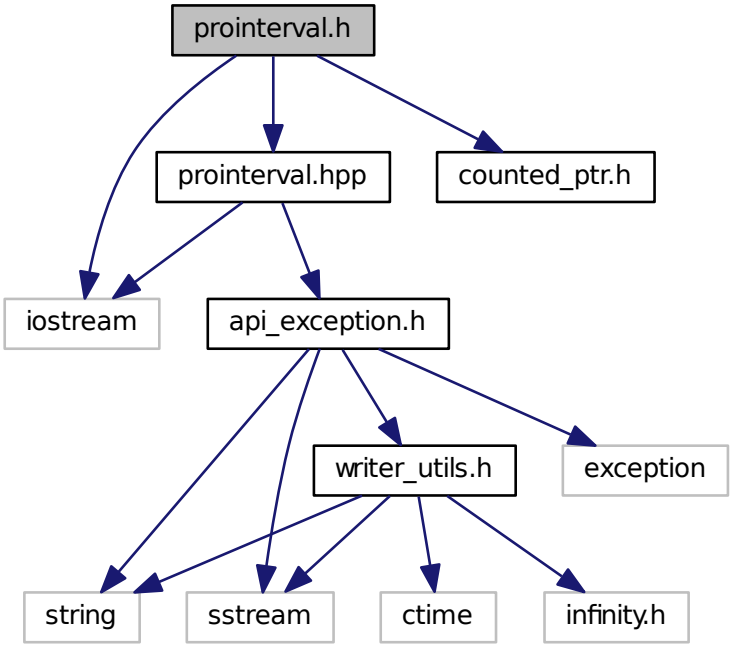
- template<typename _TA , typename _TB >
  ostream & std::operator<< (ostream &o, const pair< _TA, _TB > &a)
- template<typename _TA , typename _TB , typename _TC >
  ostream & std::operator<< (ostream &o, const triple< _TA, _TB, _TC > &a)

11.171.1 Detailed Description

Definition in file print_tuple.h.

11.172 prointerval.h File Reference

`#include <iostream>` `#include <counted_ptr.h>` `#include <prointerval.hpp>` ×
Include dependency graph for prointerval.h:



Classes

- class coco::proj_rational
- class coco::projective_interval

Namespaces

- namespace coco

  the main namespace of the COCONUT API
- namespace std

  The standard namespace.

Functions

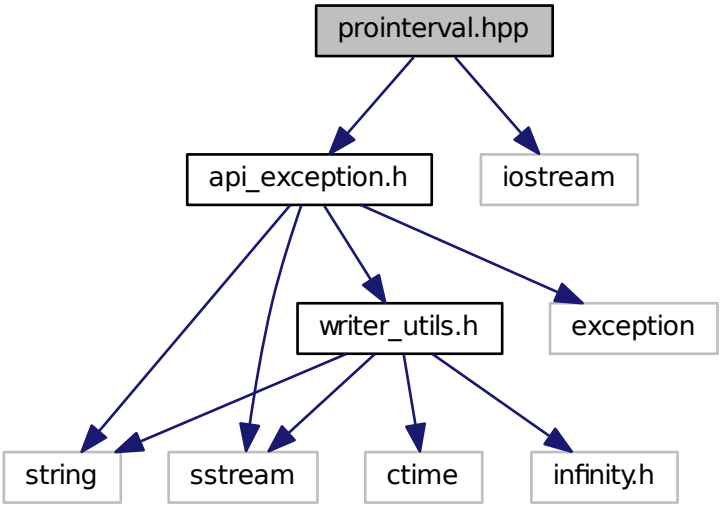
- bool coco::operator< (int n, const proj_rational &R)
- bool coco::operator<= (int n, const proj_rational &R)
- bool coco::operator> (int n, const proj_rational &R)
- bool coco::operator>= (int n, const proj_rational &R)
- bool coco::operator== (int n, const proj_rational &R)
- bool coco::operator!= (int n, const proj_rational &R)
- proj_rational coco::abs (const proj_rational &r)
- template<class I >
  I coco::pow (const I &i, const proj_rational &r)
- ostream & std::operator<< (ostream &o, const coco::proj_rational &x)
- template<class I >
  ostream & std::operator<< (ostream &o, const coco::projective_interval< I > &a)

11.172.1 Detailed Description

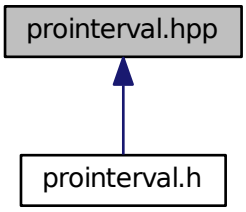
Definition in file prointerval.h.

11.173 prointerval.hpp File Reference

`#include <api_exception.h>` `#include <iostream>` Include dependency graph for prointerval.hpp-
:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco
  the main namespace of the COCONUT API

Functions

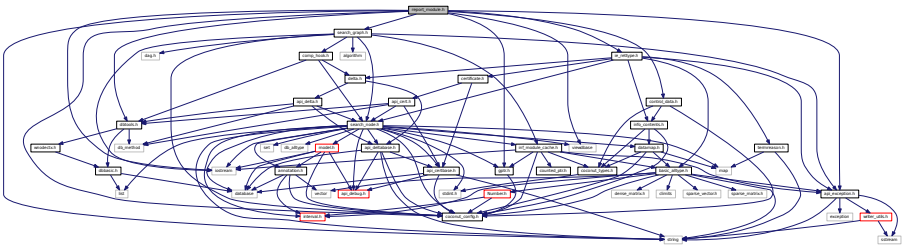
11.173.1 Detailed Description

Definition in file prointerval.hpp.

11.174 report_module.h File Reference

`#include <iostream> #include <coconut_config.h> #include <search_graph.-h> #include <gptr.h> #include <string> #include <dbtools.h> #include <viewdbase> × #include <control_data.h> #include <ie_rettype.h> #include <api_exception.-h>` Include dependency graph for report_module.h:



Classes

- class coco::report_module_exception

  Report module exception class.
- class coco::report_module

  Report module base class.

Namespaces

- namespace coco

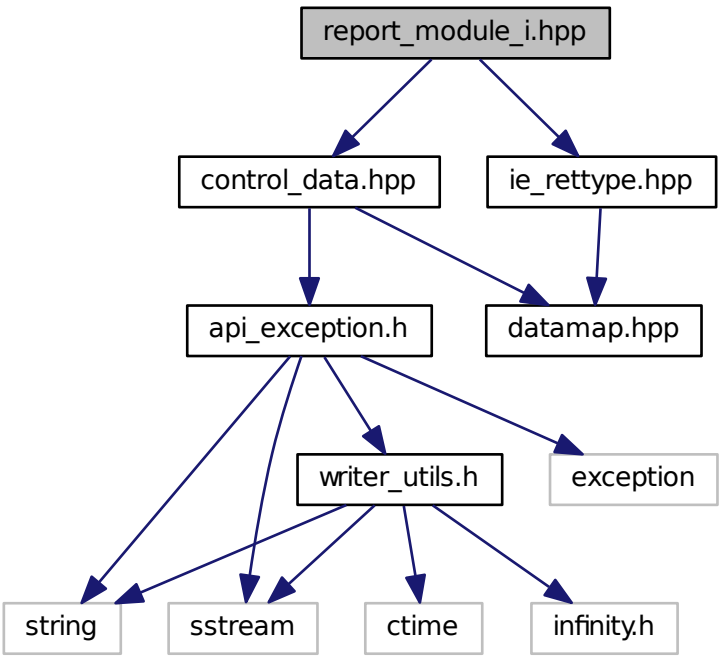
  the main namespace of the COCONUT API

11.174.1 Detailed Description

Definition in file report_module.h.

11.175 report_module_i.hpp File Reference

`#include <control_data.hpp>` `#include <ie_rettype.hpp>` Include dependency graph for report_module_i.hpp:



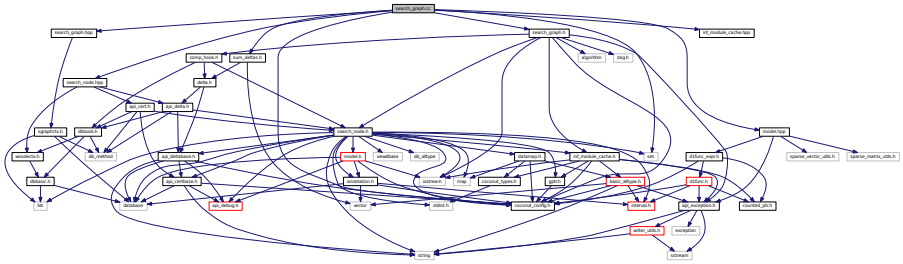
11.175.1 Detailed Description

Definition in file report_module_i.hpp.

11.176 search_graph.cc File Reference

`#include <coconut_config.h>` `#include <search_graph.h>` `#include <model.-hpp>` `#include <search_graph.hpp>` `#include <search_node.hpp>` `#include <inf-_module_cache.hpp>` `#include <set>` `#include "sum_deltas.h"` Include dependency

graph for search_graph.cc:



Classes

- class coco::coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::coco::certificate_base

  Base class for the certificates.
- class coco::coco::delta

  The delta class (updates to work nodes)
- class coco::coco::delta_base

  Base class for the deltas.
- class coco::coco::undelta

  The undelta class (undo of updates to work nodes)
- class coco::coco::undelta_base

  Base class for the undeltas.
- class coco::coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::coco::certificate_base

  Base class for the certificates.
- class coco::coco::delta

  The delta class (updates to work nodes)
- class coco::coco::delta_base

  Base class for the deltas.
- class coco::coco::undelta

  The undelta class (undo of updates to work nodes)
- class coco::coco::undelta_base

  Base class for the undeltas.
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval

- class coco::coco::convex_e

  Convexity information.
- class coco::coco::semantics

  Expression Semantics.
- class coco::coco::variable_indicator

  Bitmap class used to indicate variable occurrence.
- class coco::coco::_evaluator_base

  Base class of all evaluators.
- class coco::coco::evaluator_base

  Base class of all (non-caching) evaluators.
- class coco::coco::cached_evaluator_base

  Base class of all caching evaluators.
- class coco::coco::forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::coco::backward_evaluator_base

  Base class of all (non-caching) backward evaluators.
- class coco::coco::cached_forward_evaluator_base

  Base class of all (non-caching) forward evaluators.
- class coco::coco::cached_backward_evaluator_base

  Base class of all caching backward evaluators.
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- class coco::num::Number
- class coco::num::number_exception
- class coco::coco::api_exception

  API exception class.
- class coco::coco::nyi_exception

  Not Yet Implemented exception class.
- class coco::coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.
- struct coco::coco::coco::checking_my< T >
- struct coco::coco::coco::my_rounded_math< T >
- struct coco::coco::coco::interval_st
- class coco::coco::coco::interval
- struct coco::coco::coco::checking_my< T >
- struct coco::coco::coco::my_rounded_math< T >
- struct coco::coco::coco::interval_st
- class coco::coco::coco::interval
- class coco::coco::num::Number
- class coco::coco::num::number_exception
- class coco::coco::coco::api_exception

  API exception class.

- class coco::coco::coco::nyi_exception

  Not Yet Implemented exception class.
- class coco::coco::coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class coco::coco::expression_node

  The base class for a node in the expression DAGs.
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- class coco::coco::annotation

  Annotations for Models.
- class coco::coco::model

  The model class (an attributed DAG of expression nodes, lowest class in the model hierarchy)
- class coco::coco::model_iddata

  The model id-data class (the topmost in the model class hierarchy)
- class coco::coco::model_gid

  Model Group Data Class (middle class in the model hierarchy)
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- class coco::coco::annotation

  Annotations for Models.
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- class coco::num::Number
- class coco::num::number_exception
- class coco::coco::api_exception

  API exception class.
- class coco::coco::nyi_exception

  Not Yet Implemented exception class.
- class coco::coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class coco::coco::datamap

  The base class for communicating with COCONUT modules.
- class coco::coco::api_exception

  API exception class.
- class coco::coco::nyi_exception

  Not Yet Implemented exception class.
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >

- struct coco::coco::interval_st
- class coco::coco::interval
- struct coco::coco::checking_my< T >
- struct coco::coco::my_rounded_math< T >
- struct coco::coco::interval_st
- class coco::coco::interval
- class coco::num::Number
- class coco::num::number_exception
- class coco::coco::api_exception

  API exception class.
- class coco::coco::nyi_exception

  Not Yet Implemented exception class.
- class coco::coco::basic_alltype

  The basic alltype which can hold any of a number of basic types.
- class coco::coco::inference_module_cache_autogen

  Inference module cache auto-generate method base class.
- class coco::coco::inference_module_cache

  Inference module cache class.
- class coco::coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::coco::certificate_base

  Base class for the certificates.
- class coco::coco::delta

  The delta class (updates to work nodes)
- class coco::coco::delta_base

  Base class for the deltas.
- class coco::coco::undelta

  The undelta class (undo of updates to work nodes)
- class coco::coco::undelta_base

  Base class for the undeltas.
- class coco::coco::certificate

  The certificate class (certifies deltas for rigorous mode operation)
- class coco::coco::certificate_base

  Base class for the certificates.
- class coco::coco::search_node

  Base type of the nodes in the search graph.
- class coco::coco::delta_node

  Class holding the delta nodes in the search graph.
- class coco::coco::full_node

  Class holding the full nodes in the search graph.
- class coco::coco::work_node

  Work node, which is passed to the inference engines.
- class coco::coco::work_node::constraint_iterator_base

  The base class for work_node::constraint_iterator and work_node::constraint_const_iterator.
- class coco::coco::dbt_row

  This type is used to hold one row in some table of the search database.
- class coco::coco::dbt_row

This type is used to hold one row in some table of the search database.

- class coco::coco::work_node_context

  The evaluation context when retrieving from the search database.
- class coco::coco::point_check_feasibility

  Stored procedure checking the feasibility of a point.
- class coco::coco::box_check_intersection

  Stored procedure checking whether a box intersects the work_node's box.
- class coco::coco::delta_get_action

  Stored procedure class for computing the delta action specifier.
- class coco::sum_deltas

  Pre-post visitor for summing up all the deltas during work node extraction.
- class coco::__sg_anc_visitor

Namespaces

- namespace coco

  the main namespace of the COCONUT API
- namespace coco::coco
- namespace coco::num
- namespace coco::coco::coco
- namespace coco::coco::num

Defines

- #define DEBUG_SGRAPH_EXTRACT 0

Typedefs

- typedef vdbl::rowid coco::coco::delta_id

  The class for delta ids.
- typedef enum coco::coco::tristate_e coco::coco::tristate
- typedef uint32_t coco::coco::search_node_id

  Type of the unique search node identifier.
- typedef interval coco::coco::rhs_t
- typedef std::vector< void * > coco::coco::evaluator_v
- typedef boost::numeric::interval_lib::policies < my_rounded_math< double > , checking_my< double >> coco::coco::coco::my_policies
- typedef mpq_t coco::coco::num::rat
- typedef MP_RAT * coco::coco::num::prat
- typedef const MP_RAT * coco::coco::num::cprat
- typedef coco::interval coco::coco::num::intv
- typedef std::string coco::coco::num::str
- typedef model::walker coco::coco::expression_walker

  Walker to the expression DAG.
- typedef model::const_walker coco::coco::expression_const_walker

  Const walker to the expression DAG.

Enumerations

- enum coco::coco::tristate_e { coco::coco::t_true = 1, coco::coco::t_false = -1, coco::coco::t_maybe = 0, coco::coco::t_true = 1, coco::coco::t_false = -1, coco::coco::t_maybe = 0, coco::coco::t_true = 1, coco::coco::t_false = -1, coco::coco::t_maybe = 0, coco::coco::t_true = 1, coco::coco::t_false = -1, coco::coco::t_maybe = 0 }

- bool coco::coco::operator!= (const convex_info &__c, const convex_e &__d)
- std::ostream & coco::coco::operator<< (std::ostream &o, const convex_e &__s)

  C++ stream output operator for convex_e.
- std::ostream & coco::coco::operator<< (std::ostream &o, const semantics &__s)

  C++ stream output operator for semantics.
- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts.
- template<class _Walker , class _Visitor >
  _Visitor::return_value coco::_recursive_short_cut_walk (_Walker __w, _Visitor __f)

  Perform a recursive graph walk with possible caching and short-cuts (internal)
- template<class _Visitor , class _Walker >
  _Visitor::return_value coco::evaluate (_Visitor __v, _Walker __start)

  Evaluate an evaluator on a DAG.
- template<class _TH >
  std::string coco::coco::convert_to_str (const _TH &_h)

  Convert an object of any printable class to a string.
- std::string coco::coco::i2a (int x)

  converter int -> string
- std::string coco::coco::localdatetime ()

  converter date & time into std::string

- std::string coco::coco::datetime (const struct tm *timeptr)

  local time as C++ string
- std::string coco::coco::e2D (double d)

  Fortran real as C++ string.

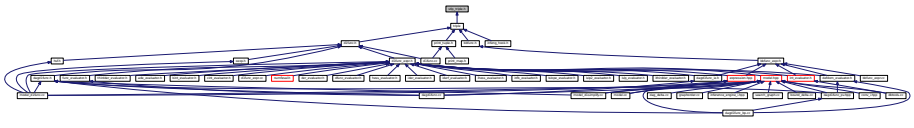
11.196.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file stlp_pairheap.h.

11.197 stlp_triple.h File Reference

This graph shows which files directly or indirectly include this file:



Classes

- struct std::triple
  triple holds three objects of arbitrary type.

Namespaces

- namespace std

  The standard namespace.

Functions

- template<class _T1 , class _T2 , class _T3 >
  bool std::operator== (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Two triples of the same type are equal iff their members are equal.
- template<class _T1 , class _T2 , class _T3 >
  bool std::operator< (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  This is lexicographic ordering of triples.
- template<class _T1 , class _T2 , class _T3 >
  bool std::operator!= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator==` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool std::operator> (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool std::operator<= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  bool std::operator>= (const triple< _T1, _T2, _T3 > &__x, const triple< _T1, _T2, _T3 > &__y)

  Uses `operator<` to find the result.
- template<class _T1 , class _T2 , class _T3 >
  triple< _T1, _T2, _T3 > std::make_triple (const _T1 &__x, const _T2 &__y, const _T3 &__z)

  A convenience wrapper for creating a triple from three objects.

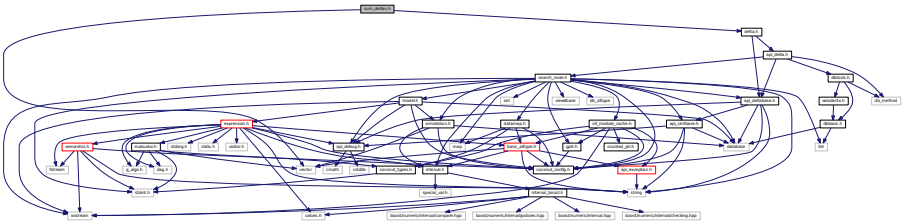
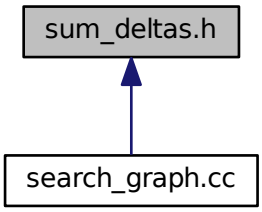
11.199 sum_deltas.h File Reference

`#include <vector>` `#include "delta.h"` Include dependency graph for sum_deltas.h:



This graph shows which files directly or indirectly include this file:



Classes

- class sum_deltas

  Pre-post visitor for summing up all the deltas during work node extraction.

Functions

- work_node full_node_to_work_node (full_node &n_full, gptr< search_node > &ground)

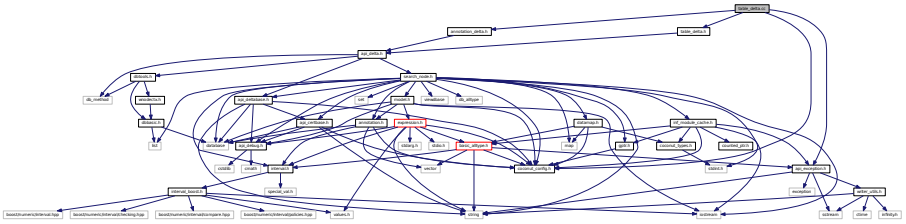
  This function converts a full_node to a work_node.

11.199.1 Detailed Description

Definition in file sum_deltas.h.

11.200 table_delta.cc File Reference

`#include <coconut_config.h>` `#include <table_delta.h>` `#include <annotation_delta.h>` `#include <api_exception.h>` Include dependency graph for table_delta.cc:



Namespaces

- namespace coco

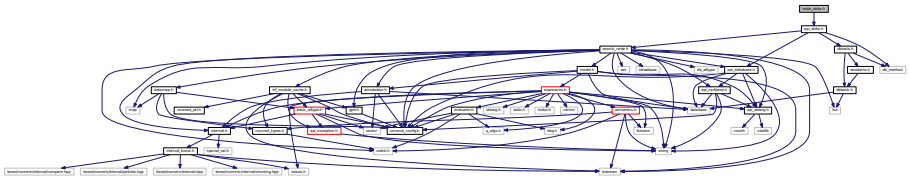
  the main namespace of the COCONUT API

11.200.1 Detailed Description

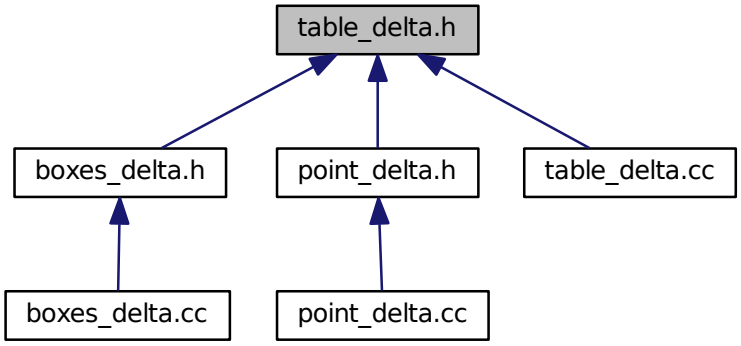
Definition in file table_delta.cc.

11.201 table_delta.h File Reference

`#include <api_delta.h>` Include dependency graph for table_delta.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::table_delta

  The base class for all deltas adding information to the search database.

Namespaces

- namespace coco

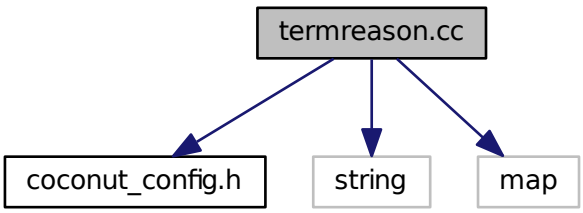
  the main namespace of the COCONUT API

11.201.1 Detailed Description

Definition in file table_delta.h.

11.202 termreason.cc File Reference

`#include <coconut_config.h>` `#include <string>` `#include <map>` Include dependency graph for termreason.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- void coco::set_translation_map (const std::map< std::string, std::string > &tr_msg_map)

  A datamap function for setting the message translation map.
- const std::string & coco::get_translated_message (const std::string &msg)

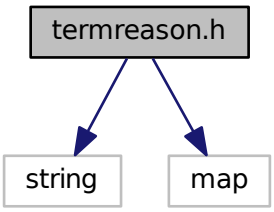
  A datamap function for message translation.

11.202.1 Detailed Description

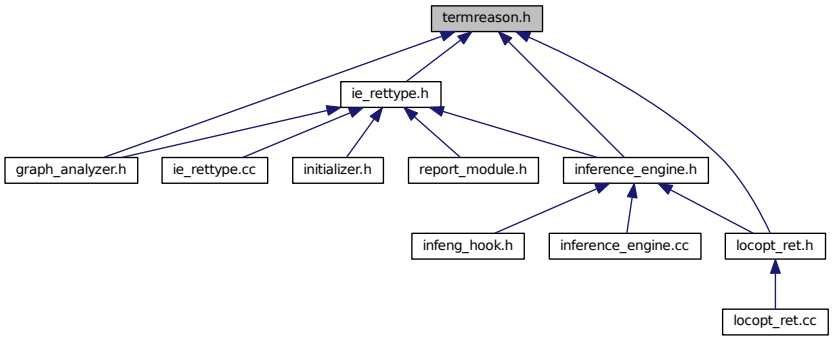
Definition in file termreason.cc.

11.203 termreason.h File Reference

`#include <string>` `#include <map>` Include dependency graph for termreason.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::termination_reason

  This class holds the reason of termination of inference and management modules.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- const std::string & coco::get_translated_message (const std::string &msg)

  A datamap function for message translation.
- void coco::set_translation_map (const std::map< std::string, std::string > &tr_msg_map)

  A datamap function for setting the message translation map.
- std::ostream & coco::operator<< (std::ostream &o, const termination_reason &__x)

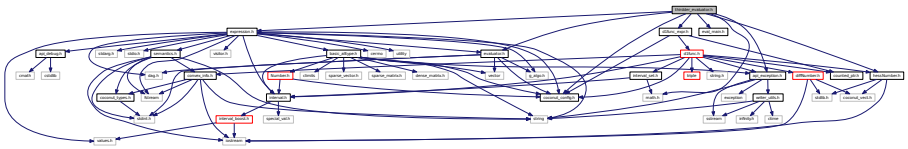
  C++ stream output operator for the termination_reason.

11.203.1 Detailed Description

Definition in file termreason.h.

11.204 thirdder_evaluator.h File Reference

`#include <coconut_config.h>` `#include <evaluator.h>` `#include <expression.-h>` `#include <eval_main.h>` `#include <math.h>` `#include <api_exception.h>` × `#include <d1func_expr.h>` `#include <hessNumber.h>` Include dependency graph for thirdder-_evaluator.h:



Classes

- struct coco::thirdderPreparationEvaluatorType
- class coco::thirdderPreparationEvaluator
- struct coco::thirdderForwardEvaluatorReturnValue
- struct coco::thirdderForwardEvaluatorType
- class coco::thirdderForwardEvaluator
- struct coco::thirdderBackwardEvaluatorType
- class coco::thirdderBackwardEvaluator

Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define DEBUG_THIRDDER_EVALUATOR 0
- #define DEBUG_FHE_LIST_NODES_WITH_PARAMETERS 0

11.204.1 Detailed Description

Definition in file thirdder_evaluator.h.

11.204.2 Define Documentation

11.204.2.1 #define DEBUG_FHE_LIST_NODES_WITH_PARAMETERS 0

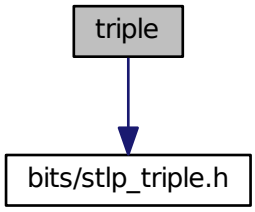
Definition at line 31 of file thirdder_evaluator.h.

11.204.2.2 #define DEBUG_THIRDDER_EVALUATOR 0

Definition at line 30 of file thirdder_evaluator.h.

11.205 triple File Reference

`#include <bits/stlp_triple.h>` Include dependency graph for triple:



This graph shows which files directly or indirectly include this file:

Defines

- #define __TRIPLE_H

11.205.1 Detailed Description

This is the external header file intended for direct use.

Definition in file triple.

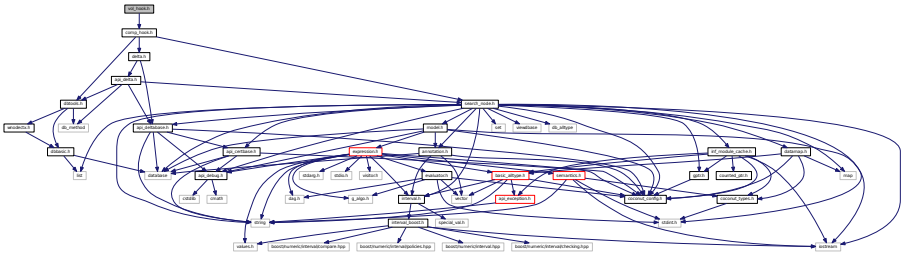
11.205.2 Define Documentation

11.205.2.1 #define __TRIPLE_H

Definition at line 30 of file triple.

11.206 vol_hook.h File Reference

`#include <comp_hook.h>` Include dependency graph for vol_hook.h:



Classes

- class coco::vol_comp_hook

  The volume computation hook (work node computation hook)

Namespaces

- namespace coco

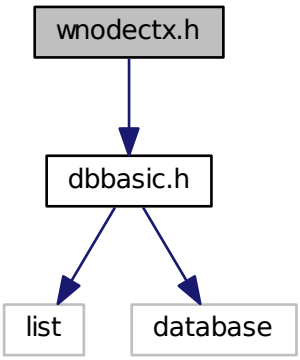
  the main namespace of the COCONUT API

11.206.1 Detailed Description

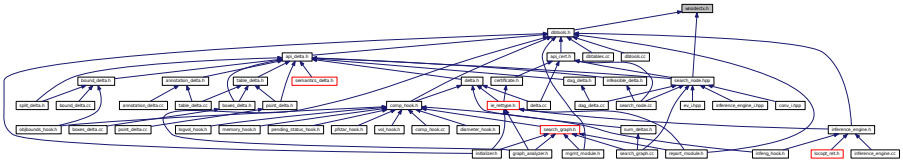
Definition in file vol_hook.h.

11.207 wnodectx.h File Reference

`#include <dbbasic.h>` Include dependency graph for wnodectx.h:



This graph shows which files directly or indirectly include this file:



Classes

- class coco::work_node_context

  The evaluation context when retrieving from the search database.

Namespaces

- namespace coco

  the main namespace of the COCONUT API

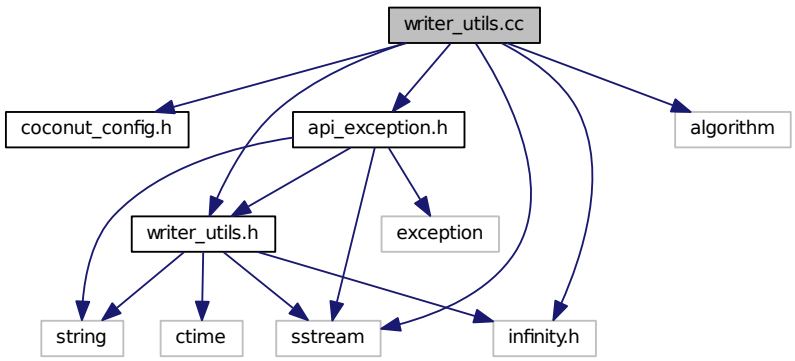
11.207.1 Detailed Description

Definition in file wnodectx.h.

11.208 writer_utils.cc File Reference

```
#include <coconut_config.h> #include <writer_utils.h> #include <sstream> ×
#include <algorithm> #include <api_exception.h> #include <infinity.h> ×
```

Include dependency graph for writer_utils.cc:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Functions

- std::string coco::i2a (int x)

  converter int -> string
- std::string coco::datetime (const struct tm *timeptr)

  local time as C++ string
- std::string coco::localdatetime ()

  converter date & time into std::string
- std::string coco::e2D (double d)

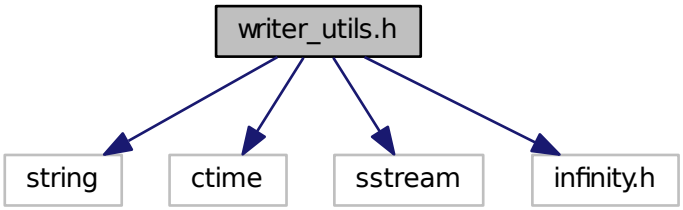
  Fortran real as C++ string.

11.208.1 Detailed Description

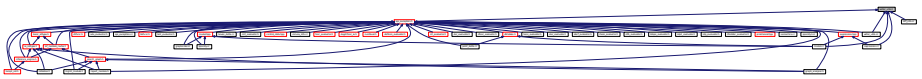
Definition in file writer_utils.cc.

11.209 writer_utils.h File Reference

`#include <string>` `#include <ctime>` `#include <sstream>` `#include <infinity.-h>` Include dependency graph for writer_utils.h:



This graph shows which files directly or indirectly include this file:



Namespaces

- namespace coco

  the main namespace of the COCONUT API

Defines

- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)
- #define double_out(d) (d)
- #define coconut_sscanfdouble(D, S, F,...) sscanf(S, F " %lf", ## __VA_ARGS__, D)

Functions

- template<class _TH >
  std::string coco::coco::convert_to_str (const _TH &_h)

  Convert an object of any printable class to a string.
- std::string coco::i2a (int x)

  converter int -> string
- std::string coco::localdatetime ()

  converter date & time into std::string
- std::string coco::datetime (const struct tm *timeptr)

  local time as C++ string
- std::string coco::e2D (double d)

  Fortran real as C++ string.

11.209.1 Detailed Description

Definition in file writer_utils.h.

11.209.2 Define Documentation

11.209.2.1 #define coconut_sscanfdouble(*D, S, F, ...*) sscanf(S, F " %lf", ## __VA_ARGS__, D)
