# The probabilistic Approach

Chang & Xu, 2011

$$= \sum_{\substack{i_1, \dots, i_m \geq 0 \\ i_1 + \dots + i_m = n}} \frac{n!}{2^n} \binom{2i_1}{i_1} \cdots \binom{2i_m}{i_m}.$$

Since the probability density function of  $X_1^2 + X_2^2 + \cdots + X_m^2$  is identical to the probability density function of  $\chi^2(m)$ , we have

$$\mathbb{E}(X_1^2 + X_2^2 + \cdots + X_m^2)^n = \frac{2^n \Gamma(\frac{m}{2} + n)}{\Gamma(\frac{m}{2})}.$$

which completes the proof.

$$\sum_{i_1 + \cdots + i_t = n} \binom{2i_1}{i_1} \binom{2i_2}{i_2} \cdots \binom{2i_t}{i_t} = \frac{4^n}{n!} \frac{\Gamma(\frac{t}{2} + n)}{\Gamma(\frac{t}{2})}$$

# The probabilistic Approach

$$\sum_{i_1+\dots+i_t=n} \binom{2i_1}{i_1} \binom{2i_2}{i_2} \cdots \binom{2i_t}{i_t} = \frac{4^n}{n!} \frac{\Gamma(\frac{t}{2} + n)}{\Gamma(\frac{t}{2})}$$

$$\sum_{i_1+\dots+i_{2t-1}=n} \binom{2i_1}{i_1} \binom{2i_2}{i_2} \cdots \binom{2i_{2t-1}}{i_{2t-1}} = \frac{\binom{2n+2t-2}{2n}}{\binom{n+t-1}{n}} \binom{2n}{n}$$

$$\sum_{i_1+\dots+i_{2t}=n} \binom{2i_1}{i_1} \binom{2i_2}{i_2} \cdots \binom{2i_{2t}}{i_{2t}} = 4^n \binom{n+t-1}{n}$$

Back to an old identity:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

# The “natural” approach

Claim:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

Let  $[n] = \{1, 2, \dots, n\}$  for a positive integer  $n$  (we also write  $[0] = \emptyset$ ) and suppose  $0 \leq i, j \leq n$  with  $i + j = n$ ,  $i, j \in \mathbb{Z}$ . Let  $A = [2i]$  and  $B = [2j]$ . We count the pairs of form  $(X, Y)$ , where

$$\begin{cases} X \subseteq A \text{ and } |X| = \frac{1}{2}|A| = i \\ Y \subseteq B \text{ and } |Y| = \frac{1}{2}|B| = j \end{cases}$$

and  $i$  and  $j$  take all possible values.

Back to an old identity:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

○○○○○●○○○○○○○

New proof

## The “natural” approach

Claim:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

Example:

Take  $n = 11$  and  $i = 5$ . Hence,  $A = \{1, 2, \dots, 10\}$  and  $B = \{1, 2, \dots, 12\}$ .

Let  $X = \{2, 3, 4, 8, 9\}$  and  $Y = \{2, 3, 5, 7, 8, 11\}$

Back to an old identity:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

$$\text{○○○○○○○○○○●○○} \\ \sum_{i+j=n} \binom{2i-k}{i} \binom{2j+k}{j} = 4^n$$

## Generalization (“Analytic” approach)

Let  $g_k(x) = \sum_{n \geq 0} \binom{2n+k}{n} x^n$ . Then

$$g_0(x) = \frac{1}{\sqrt{1-4x}}$$

Let also

$$C(x) = \frac{2}{1 + \sqrt{1-4x}}$$

( $C(x)$  is the generating function of the Catalan numbers)

Then

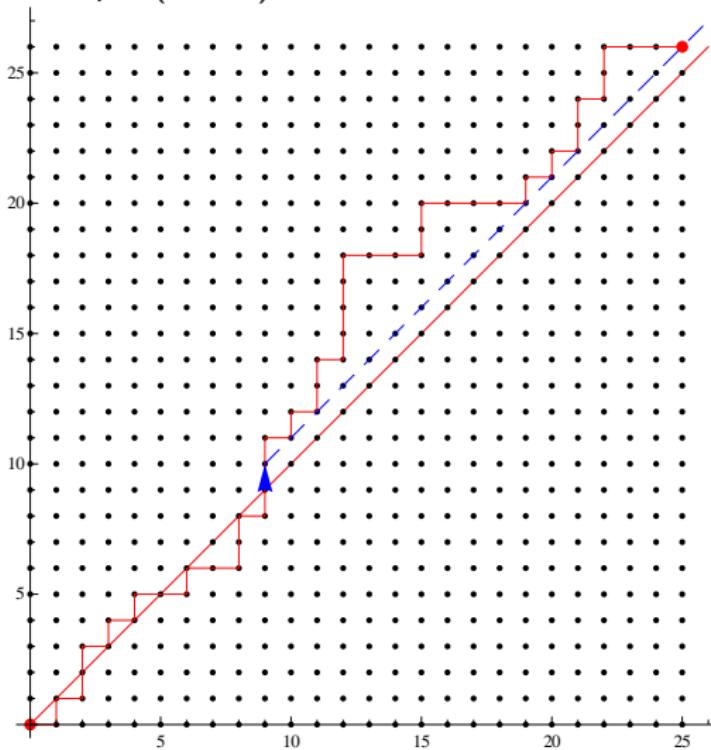

$$g_k(x) = g_0(x) C^k(x).$$

$$\text{Back to an old identity: } \sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$$

$$\circ\circ\circ\circ\circ\circ\circ\circ\circ\circ\bullet\bullet\circ\sum_{i+j=n} \binom{2i-k}{i} \binom{2j+k}{j} = 4^n$$

## Generalization (“Analytic” approach)

Example ( $k = 1$ ):

Back to an old identity:  $\sum_{i+j=n} \binom{2i}{i} \binom{2j}{j} = 4^n$

$$\textcircled{oooooooooooo}\textcircled{ooooo} \sum_{i+j=n} \binom{2i-k}{i} \binom{2j+k}{i} = 4^n$$

Theorem. Let  $k_1, \dots, k_t$  be any integers such that  $k_1 + \dots + k_t = 0$ .

Then

$$\sum_{i_1+\dots+i_t=n} \binom{2i_1+k_1}{i_1} \binom{2i_2+k_2}{i_2} \cdots \binom{2i_t+k_t}{i_t} = \sum_{i_1+\dots+i_t=n} \binom{2i_1}{i_1} \binom{2i_2}{i_2} \cdots \binom{2i_t}{i_t}.$$
