“SUPERCHARACTERS AND SUPERCLASSES” were first introduced for *finite unitriangular groups* by C. André (in a series of papers in J. of Algebra) using polynomial equations defining certain algebraic varieties (invariant under conjugation).

Algebraic geometry was avoided and the construction was simplified by N. Yan (2000). Later, the notion of a “SUPERCHARACTER THEORY” for an *arbitrary finite group* was developed by P. Diaconis and I. M. Isaacs in the paper

- P. Diaconis & I. M. Isaacs, *Supercharacters and superclasses for algebra groups*, Trans. AMS (2008).

Roughly, a “SUPERCHARACTER THEORY” replaces

IRREDUCIBLE CHARACTERS	→	“SUPERCHARACTERS”
CONJUGACY CLASSES	→	“SUPERCLASSES”
CHARACTER TABLE	→	“SUPERCHARACTER TABLE”

- Supercharacters and superclasses

- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

A SUPERCHARACTER THEORY of a finite group G consists of

- a partition \mathcal{K} of G
- a set \mathcal{X} of (complex) characters of G

satisfying the following three *axioms*:

1. $|\mathcal{K}| = |\mathcal{X}|$;
2. every irreducible character of G is a constituent of a unique $\xi \in \mathcal{X}$;
3. the characters in \mathcal{X} are constant on the members of \mathcal{K} .

A SUPERCHARACTER THEORY of a finite group G consists of

- a partition \mathcal{K} of G
- a set \mathcal{X} of (complex) characters of G

satisfying the following three *axioms*:

1. $|\mathcal{K}| = |\mathcal{X}|$;
2. every irreducible character of G is a constituent of a unique $\xi \in \mathcal{X}$;
3. the characters in \mathcal{X} are constant on the members of \mathcal{K} .

- The elements of \mathcal{K} are called the *superclasses* of G ,
- the elements of \mathcal{X} are called the *supercharacters* of G .

- Supercharacters and superclasses

- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Any finite group has two *trivial supercharacter theories*:

- Supercharacters and superclasses

- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Any finite group has two *trivial supercharacter theories*:

1. SUPERCLASSES: $\{1\}, G - \{1\}$;
SUPERCHARACTERS: $1_G, \rho_G - 1_G$.

- Supercharacters and superclasses

- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Any finite group has two *trivial supercharacter theories*:

1. SUPERCLASSES: $\{1\}, G - \{1\}$;
SUPERCHARACTERS: $1_G, \rho_G - 1_G$.

2. The *full character theory*:

SUPERCLASSES: conjugacy classes of G ,

SUPERCHARACTERS: irreducible characters of G .

- Supercharacters and superclasses

- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Any finite group has two *trivial supercharacter theories*:

1. **SUPERCLASSES:** $\{1\}, G - \{1\}$;
SUPERCHARACTERS: $1_G, \rho_G - 1_G$.
2. The *full character theory*:

SUPERCLASSES: conjugacy classes of G ,

SUPERCHARACTERS: irreducible characters of G .

For some groups these are the only possibilities, there are many groups for which nontrivial supercharacter theories exist.

In many cases it may be possible to obtain useful information using some particular supercharacter theory. For instance, E. Arias-Castro, P. Diaconis and R. Stanley showed that a special supercharacter theory can be applied to study a *random walk on uppertriangular matrices over finite fields* using techniques that traditionally required the knowledge of the full character theory.

Algebra groups

- The unitriangular group II

- Pattern groups

Let us consider the *dual space* J^* of J as is a *left A -module* for the natural representation:

$$af(u) = f(ua) \quad (a \in A, f \in J^*, u \in J)$$

Let

- $\mathcal{L}(f) = \{a \in J : af = 0\}$,
- $L(f) = 1 + \mathcal{L}(f)$,
- $\vartheta_f : L(f) \rightarrow \mathbb{C}$ the map defined by

$$\vartheta_f(1 + a) = \vartheta(a) \quad (a \in \mathcal{L}(f))$$

where ϑ is a *nontrivial additive character* of \mathbb{F}_q

- $L(f)$ is an *algebra subgroup* of $G = 1 + J$,
- ϑ_f is a *linear character* of $L(f)$.

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

We define the **SUPERCHARACTER** of G (associated with $f \in J^*$) to be the induced character $\xi_f = (\vartheta_f)^G$.

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

We define the **SUPERCHARACTER** of G (associated with $f \in J^*$) to be the induced character $\xi_f = (\vartheta_f)^G$.

Theorem. For any $f \in J^*$,

- $\xi_f(1) = |Gf| = |Jf|;$
- $\langle \xi_f, \xi_g \rangle \neq 0 \iff g \in GfG \iff \xi_f = \xi_g;$
- $\langle \xi_f, \xi_f \rangle = |Gf \cap fG| = |Jf \cap fJ|.$

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

We define the **SUPERCHARACTER** of G (associated with $f \in J^*$) to be the induced character $\xi_f = (\vartheta_f)^G$.

Theorem. For any $f \in J^*$,

- $\xi_f(1) = |Gf| = |Jf|;$
- $\langle \xi_f, \xi_g \rangle \neq 0 \iff g \in GfG \iff \xi_f = \xi_g;$
- $\langle \xi_f, \xi_f \rangle = |Gf \cap fG| = |Jf \cap fJ|.$

Remark. We obtain a similar result by replacing the *left* by the *right representation* of A on J^* . In particular, $\xi_f(1) = |Jf| = |fJ|.$

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

It is clear that $\{GfG : f \in J^*\}$ is a partition of J^* . In fact, we have the following.

Theorem. *The regular character ρ_G decomposes as the (orthogonal) sum*

$$\rho_G = \sum_{GfG \subseteq J^*} m_f \xi_f$$

where $m_f = \frac{|Gf \cap fG|}{|Gf|} = \frac{|Gf|}{|GfG|} \quad (f \in J^*)$.

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

It is clear that $\{GfG : f \in J^*\}$ is a partition of J^* . In fact, we have the following.

Theorem. *The regular character ρ_G decomposes as the (orthogonal) sum*

$$\rho_G = \sum_{GfG \subseteq J^*} m_f \xi_f$$

where $m_f = \frac{|Gf \cap fG|}{|Gf|} = \frac{|Gf|}{|GfG|} \quad (f \in J^*).$

In particular, we deduce that

Theorem. *Every irreducible character of $G = 1 + J$ is a constituent of a unique supercharacter.*

- The unitriangular group II
- Pattern groups

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Theorem. For all $f \in J^*$ and all $a \in J$, we have

$$\xi_f(1 + a) = \frac{\xi_f(1)}{|GfG|} \sum_{g \in GfG} \vartheta_g(a) = \frac{\xi_f(1)}{|GaG|} \sum_{b \in GaG} \vartheta_f(b).$$

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Theorem. For all $f \in J^*$ and all $a \in J$, we have

$$\xi_f(1 + a) = \frac{\xi_f(1)}{|GfG|} \sum_{g \in GfG} \vartheta_g(a) = \frac{\xi_f(1)}{|GaG|} \sum_{b \in GaG} \vartheta_f(b).$$

The **SUPERCLASS** of $x \in G$ is defined to be $K_x = 1 + G(x - 1)G$.

Theorem. The sets $\{\xi_f : f \in J^*\}$ and $\{K_x : x \in G\}$ define a **super-character theory** for $G = 1 + J$.

- Supercharacters and superclasses
- Algebra groups
- The unitriangular group I
- Connections with set partitions
- Factorization of supercharacters
- “Indecomposable” supercharacters
- The unitriangular group II
- Pattern groups

Theorem. For all $f \in J^*$ and all $a \in J$, we have

$$\xi_f(1 + a) = \frac{\xi_f(1)}{|GfG|} \sum_{g \in GfG} \vartheta_g(a) = \frac{\xi_f(1)}{|GaG|} \sum_{b \in GaG} \vartheta_f(b).$$

The **SUPERCLASS** of $x \in G$ is defined to be $K_x = 1 + G(x - 1)G$.

Theorem. The sets $\{\xi_f : f \in J^*\}$ and $\{K_x : x \in G\}$ define a **super-character theory** for $G = 1 + J$.

In fact, a **theorem of Brauer** implies that $|G \setminus J / G| = |G \setminus J^* / G|$.

Thus, we may define the **SUPERCHARACTER TABLE** of G to be the square (complex) matrix with entries given by the supercharacter values on the superclasses.
